Executive summary

Brooks Road Landfill (the Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent).

The Site, which operates under Environmental Compliance Approval (ECA)[1] No. A110302, has an approved annual fill rate of 250,000 tonnes per year and a total approved capacity of 1,045,065 cubic metres (m^3) (including waste and daily/final cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (C of A, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP)) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021.

Under the ECA, the Site is licensed to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3 hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the Site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process, as stated in Section 15 of the Waste Management Projects Regulation (O. Reg. 101/07) of the *EA Act*.

BRE is seeking to increase the capacity of the existing Site by approximately 219,400 m^3 (including waste and daily cover) through a combination of vertical and horizontal expansion of the existing landfill. The proposed vertical and horizontal expansion will allow BRE to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their residual material. Expanding the capacity of the Site by 219,400 m^3, as proposed through this Project, will allow operations to continue at the current fill rate and annual waste filling capacity for approximately two additional years once the current approved capacity is reached. There are no changes to the annual fill rate limits nor to the annual waste filling capacity of the Site proposed as part of this Project.

The vertical and horizontal capacity expansion proposed under this Project is subject to the Environmental Screening Process (Screening) in accordance with Section 13 of O. Reg. 101/07 – Waste Management Projects of the *EA Act*. The Environmental Screening Process was conducted in accordance with the Ontario Ministry of Environment, Conservation and Parks (MECP) "Guide to Environmental Assessment Requirements for Waste Management Projects". Through the Environmental Screening Process, the potential for the Project to result in adverse environmental effects was assessed. As there will be changes to the currently approved total landfill volume, footprint, and final site contours, it was concluded in the Screening Criteria Checklist that the Project could have potential environmental effects on the following environmental components:

– Surface Water;
– Geology and Hydrogeology;
– Land Use & Socio-Economic;
– Air Quality and Odour;

[1] The Ontario *Environmental Protection Act* in 2011 the term 'Certificate of Approval' (C of A) was changed to 'Environmental Compliance Approval' (ECA). All previously issued CA's are now referred to as ECAs.

– Noise;
– Natural Environment and,
– Traffic.

To further evaluate the potential effects on the environmental components identified through the initial Screening process, studies were completed to review the existing environmental conditions within the Site Study Area (SSA) and Local Study Area (LSA), identify potential effects, apply appropriate mitigation measures and determine the resultant net effects to the environment. With this in mind, separate stand-alone evaluations were completed for the following environmental components:

1. Surface Water Assessment
2. Geology and Hydrogeology Assessment
3. Land Use and Socio-Economic Assessment
4. Air Quality and Odour Assessment
5. Noise Impact Assessment
6. Natural Environment Assessment
7. Traffic Impact Assessment

Through the assessment of the Project's potential environmental effects of the Project, it was determined that increasing the total waste disposal capacity would result in minor environmental impacts. However, through the application of mitigation measures, the Project is not anticipated to result in any new net negative effects on the environment. As a result, the advantages of the Project outweigh the disadvantages.

Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302.

Appendices

1. Introduction

Brooks Road Environmental (BRE, Owner, Proponent) has undertaken an Environmental Screening Process (Screening) in accordance with the Waste Management Project Regulation (Ontario Regulation [O. Reg.] 101/07) of the Ontario *Environmental Assessment Act* (*EA Act*) in order to expand the existing Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. This Environmental Screening Report (ESR) documents the Screening carried out and includes a description of the Project, a description of the existing environment, consultation activities, mitigation and monitoring measures, and net effects of the project.

1.1 Project Proponent

BRE is a Canadian operating company in Haldimand County, Ontario, owned and operated by 2270386 Ontario Limited. The BRE contact for this project is as follows:

Tim Danyliw, P.Eng, PMP
Project Manager, Brooks Road Environmental
160 Brooks Road
Cayuga, Ontario, N0A 1E0
Tel: (226) 979-2468
Email: **tim@gpnvironmental.ca**

1.2 Project Location

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The location of the Site is shown in **Figure 1.1.**

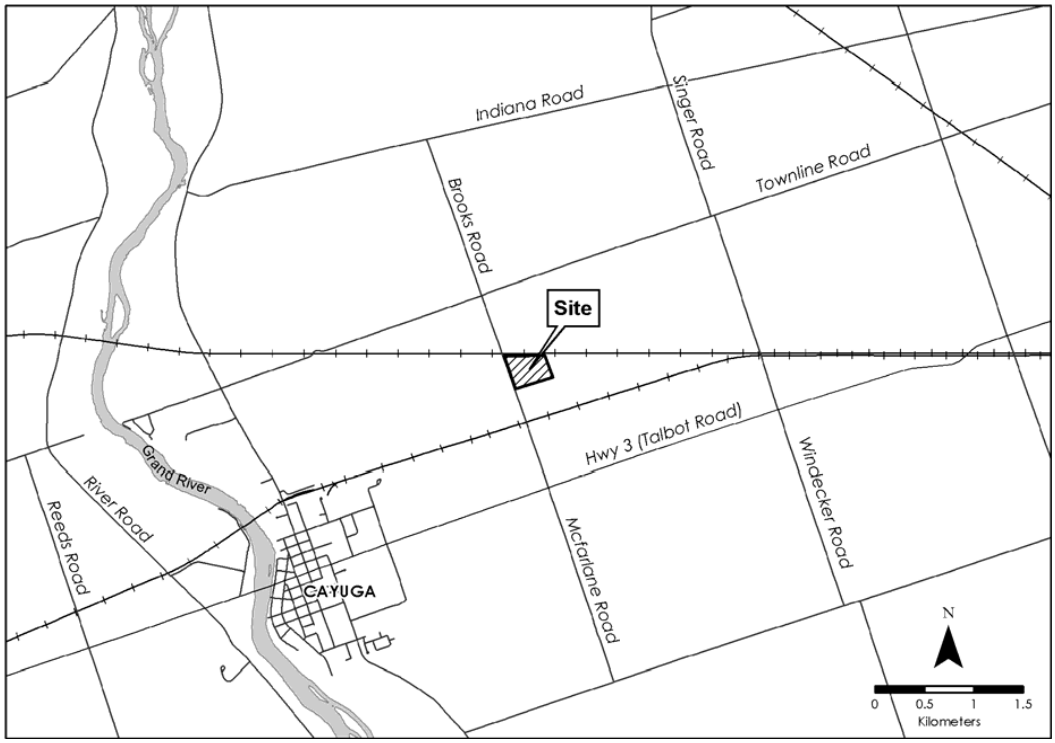

Figure 1.1 Site Location Map

1.3 Project Background

The Site, which operates under Environmental Compliance Approval (ECA)[2] No. A110302, has an approved annual fill rate of 250,000 tonnes per year and a total approved capacity of 1,045,065 cubic metres (m^3) (including waste and daily/final cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (C of A, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP)) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021.

Under the ECA, the Site is licensed to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3 hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the Site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process, as stated in Section 15 of the Waste Management Projects Regulation (O. Reg. 101/07) of the *EA Act*.

BRE is seeking to increase the capacity of the existing Site by approximately 219,400 m^3 (including waste and daily cover) through a combination of vertical and horizontal expansion of the existing landfill. The proposed vertical and horizontal expansion will allow BRE to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their residual material. Expanding the capacity of the Site by 219,400 m^3, as proposed through this Project, will allow operations to continue at the current fill rate and annual waste filling capacity for approximately two additional years once the current approved capacity is reached. There are no changes to the annual fill rate limits nor to the annual waste filling capacity of the Site proposed as part of this Project.

The vertical and horizontal capacity expansion proposed under this Project is subject to the Environmental Screening Process (Screening) in accordance with Section 13 of O. Reg. 101/07 – Waste Management Projects of the *EA Act* as follows:

> *A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:*
>
> 1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
> 2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
> 3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

[2] The Ontario *Environmental Protection Act* in 2011 the term 'Certificate of Approval' (C of A) was changed to 'Environmental Compliance Approval' (ECA). All previously issued CA's are now referred to as ECAs.

Section 13 of O. Reg. 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. This Screening is being conducted in accordance with the planning and design process outlined in Ontario MECP "Guide to Environmental Assessment Requirements for Waste Management Projects" (Guide)[3]. A Screening includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identify environmental effects. The results of the Screening are documented within this ESR, which will be released for review by Indigenous communities, the public, and government agencies for a defined comment period. BRE will incorporate feedback received during the comment period, as appropriate and where possible, into a Final ESR to be posted for a 60-day review and comment period. Upon completion of the Environmental Screening Process, an application will be made to amend the existing ECA No. A110302.

1.3.1 History of the Brooks Road Landfill Site

The Site has gone from being a rural 'dump' (i.e., non-engineered, unlined, waste disposal pits) to a modern engineered and operated waste management facility/landfill. Due to the nature of some of the waste that was historically disposed at the Site, the Site was remediated to remove previous waste deposited on-Site from the unlined disposal pits, some of which was deemed to be hazardous under Ontario Regulations. Since BRE has taken Ownership, the Site has undergone numerous improvements from an operational and safety standpoint, received approval for a vertical capacity expansion under the *EA Act*, and been granted amendments to its ECA. A short summary of the Site's history is provided in the subsections below.

Establishment of the Brooks Road Landfill Site

The Site was first established in 1959 as a rural dump for the surrounding area. A lack of provincial environmental protections and waste legislation at the time allowed for the accumulation of hazardous wastes in areas of the Site that gave rise to concerns about toxic contamination. In 1971, provincial legislation was enacted requiring that all waste disposal operators apply for a C of A (now referred to as an ECA), resulting in the renaming of the Site to Edwards Landfill. Edwards Landfill continued to operate and accept IC&I waste from the County between 1971 and 1977.

From 1977 to 2002 waste disposal at Edwards Landfill occurred only on an intermittent basis. The Site was purchased by Haldimand-Norfolk Sanitary Landfill Inc. in 2002, and an application was submitted to reopen the Site. The Ministry of the Environment (now MECP) granted an ECA for Edwards Landfill to reopen, subject to a list of conditions. The main requirement of Haldimand-Norfolk Sanitary Landfill Inc. was to decommission the disposal pits that had historically accepted potentially hazardous wastes.

Haldimand-Norfolk Sanitary Landfill Inc. submitted an application in 2004 to amend the maximum daily fill rate from 10 tonnes per day to 500 tonnes per day. The proposal was granted by the Ministry of the Environment in February 2005; however, an application seeking leave to appeal the decision was filed in June of that same year. A Settlement Agreement was reached between the appellants, Haldimand-Norfolk Sanitary Landfill Inc., and the Ministry of the Environment in November of 2006, and the appeal was withdrawn. A number of important issues and concerns related to the Edwards Landfill and its operation were raised during the appeal and are summarized as follows:

Inexperience of Operator (Haldimand-Norfolk Sanitary Landfill Inc. at the time) – no experience, expertise, or capability to operate a landfill receiving up to 500 tonnes of waste per day, nor to decommission historic waste disposal pits.

Non-compliance – not in compliance with a number of the conditions contained in the existing Site ECA and the County's Tree Control Bylaw.

Inadequacies of Site Decommissioning Plan – Site Decommissioning Plan at the time of the previous application was inadequate and its implementation could have resulted in significant harm to the environment.

[3] Ministry of the Environment, Conservation and Parks. (2007). *Guide to Environmental Assessment Requirements for Waste Management Projects*.

Truck Traffic Impacts – suitability of the Site to sustain the traffic volumes and loads associated with a fill rate of 500 tonnes per day was not assessed, nor was the impact of truck traffic on several other area roads.

Fundamental Unsuitability of Site – the location is fundamentally unsuitable for a landfill, particularly in regard to hydrogeological conditions, including the potential presence of karst topography and abandoned gypsum mines in the Site vicinity and the proximity of Provincially Significant Wetlands (PSW) and a National Historic Site.

Flawed Approvals Process – a proponent wishing to establish a new 600,000 m^3 landfill in Ontario will ordinarily be subject to a mandatory public hearing, and the approval process followed by Haldimand-Norfolk Sanitary Landfill Inc. was designed to purposely circumvent that requirement.

Significant management and financing issues led Haldimand-Norfolk Sanitary Landfill Inc. to declare bankruptcy in 2007, leaving no plan in place for cleaning up the areas of concern at the Site. The Site went into receivership in September 2007, with SF Partnership Chartered Accountants as acting receivers. Community members and Indigenous communities expressed concerns over the following years about mismanagement of the Site.

Brooks Road Environmental Purchase of the Site

In May 2012, BRE purchased the Site with a plan for the future of the landfill as a modern facility managed in accordance with MECP requirements. Although the above concerns were raised with a different owner, BRE reviewed these issues as a starting point to address community concerns.

By January 2014, the Site had been fully decommissioned, which included excavation and the off-Site disposal of 193.37 tonnes of suspected hazardous waste and impacted soils at Newalta's waste disposal facility at 65 Green Mountain Road in Stoney Creek, Ontario, the excavation and off-Site disposal of five over-packed drums of solid non-hazardous waste to Tervita's waste transfer station at 1650 Upper Ottawa Street in Hamilton, Ontario, the off-Site disposal of 27,680 litres of liquid industrial waste to Newalta's facility at 1131 Snow Valley Road, Barrie, Ontario, and the relocation of 60,204 m^3 of non-hazardous solid waste and impacted soil from the unlined disposal pits (referred to as the Original Landfill Area or OLA) to the on-Site engineered landfill cells. Results of the soil sampling program confirmed that all waste and impacted soils had been removed from the OLA and the remaining native soil within the decommissioning area met the applicable Ontario Soil Criteria standards provided in O. Reg. 153/04. All decommissioning activities are documented in the Site Decommissioning Report[4] submitted to the Ministry of the Environment (now MECP) on January 30, 2014, and BRE provided an irrevocable letter of credit to the Ontario Government to satisfy the Financial Assurance requirements. Further, a renewed Indigenous community, Agency and public consultation/outreach program was put in place upon BRE's purchase of the Site – and continues today – to provide immediate data and to consult on future plans for the Site. In short, a significant improvement to the Site and its operations came about as a result of the new ownership.

Brooks Road Landfill Vertical Capacity Expansion EA 2019 Approval

In 2018, BRE completed an Individual EA (known as the Brooks Road Landfill Vertical Capacity Expansion EA) to increase the total approved capacity at the Site by 421,000 m^3 to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period. The approved Brooks Road Landfill Vertical Capacity Expansion EA also proposed a change to the rate of waste received on-Site from a daily maximum of 500 tonnes per day to an annual maximum of 151,000 tonnes per year to accommodate busier months of operation in the spring and summer when more construction waste is produced compared to the winter months. Any proposed change in the annual fill rate limits requires a modification to Condition 3(7) of the approved ECA, which specifies that the maximum amount of waste that may be received at the landfill on an annual basis. The approved Brooks Road Landfill Vertical Capacity Expansion EA assessed the effects to the environment based on a maximum daily fill rate of 1,000 tonnes per day to demonstrate that the Site could manage this daily quantity, while maintaining the same annual limits (151,000 tonnes per year). Therefore, the 1,000 tonnes per day was used in the EA as a benchmark for the environmental effects analysis. On January 15, 2019, the MECP approved the Brooks Road Landfill Vertical Capacity Expansion EA. The

[4] Report was provided by Conestoga-Rivers & Associates. (2014, October 9).

resulting March 27, 2020 amendment to the ECA reflected a daily maximum of 1,000 tonnes per day and annual maximum of 151,000 tonnes per year.

Environmental Compliance Approval Amendment 2021

The Site ECA was recently amended to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process, as stated in Section 15 of the Waste Management Projects Regulation (O. Reg. 101/07) of the *EA Act*. The Environmental Screening Process to amend the approved ECA that commenced in November 2020 was completed in early 2021. The results of the Screening were documented in an ESR, which was released for a 60-calender day review to government agencies, Indigenous communities, and the public on April 15, 2021.

1.4 Problem, Purpose, and Opportunity

The purpose of the Project is to increase the capacity of the Site by approximately 219,400 m^3 (including waste and daily cover). This will be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically, as well as increasing the existing landfill footprint to expand the Site horizontally. The former railway property will continue to provide buffer land for the Site. Additionally, a revision of the final contours proposed under the ESR will require modification to the northern perimeter access road and stormwater drainage ditch.

The Site accepts only non-hazardous solid waste, and serves a primarily industrial customer base, who have already extracted the value from their residual material and need a permitted, environmentally secure facility to manage the residual material their operations generate.

BRE intends to continue serving its existing customer base and is responding to the economic opportunity of providing waste management services to address the continued and growing demand from local and regional customers that require a facility that is permitted to manage the residual materials they generate. Extending the life of the Site will provide BRE with increased flexibility in terms of how best to serve its existing waste clients while remaining competitive within the marketplace. As part of its business plan, BRE reviewed the following:

- The current post-diversion solid, non-hazardous industrial residual material generated in Ontario, requiring a local, safe, and secure disposal facility
- Future post-diversion solid, non-hazardous industrial residual material generated in Ontario, requiring a local, safe, and secure disposal facility
- Development and analysis of potential long-term disposal capacity options that BRE could implement in order to continue providing waste management disposal services to their current businesses and customers

1.5 Description of Project Components and Activities

The Project for which the Screening is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final Site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This will be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (exceeding current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch will be required to accommodate the proposed changes to the final Site contours. The former railway property will continue to provide buffer land for the Site (see **Figure 1.2**). Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in Table 1.1.

Table 1.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted north by 30 m. East and west ditches will extend north to maintain full perimeter ditch.
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

Environmental investigations were carried out as part of the Screening to confirm the potential environmental effects associated with the implementation of the Project; identify mitigation or compensation measures required to address potential adverse environmental effects; and determine the remaining net effects following the application of mitigation and/or compensation measures.

1.6 Approval Requirements

A change in the capacity of the landfill requires a modification to Condition 3(6) of the approved ECA, which specifies the maximum volumetric capacity for the Site including waste and daily cover. This proposed vertical and horizontal capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of the Waste Management Projects Regulation, (O. Reg. 101/07) of the *EA Act*.

When the Environmental Screening Process has been completed, BRE will prepare and apply to the MECP to amend ECA No. A110302.

2. Environmental Screening Process for Waste Management Projects

As stated above, the Environmental Screening Process under the Waste Management Projects Regulation (O. Reg. 101/07) of the *EA Act* was followed for the proposed Project. As per Section 13 of O. Reg. 101/07,

> *A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:*
>
> 1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
> 2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
> 3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

In accordance with Section 13 of O. Reg. 101/07, the proposed 219,400 m^3 expansion is exempt from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. In support of O. Reg. 101/07, the MECP published the *Guide to Environmental Assessment Requirements for Waste Management Project* (Guide), which outlines the planning and design process for the Environmental Screening Process. This Screening was conducted in accordance with the planning and design process outlined in the Guide, following the process as illustrated in **Table 2.1**.

This ESR has been prepared as a part of the Environmental Screening Process, documenting the potential adverse environmental effects of the Project on the environment. Where adverse environmental effects have been identified, mitigation and monitoring measures have been recommended to reduce or eliminate the effects.

Step 6	Conduct Studies and Assessment of Potential Environmental Effects
Step 7	Develop Impact Management / Mitigation Measures
Step 8	Consultation and Public Open House #2
Step 9	Identify Significant Net Effects and Resolve Concerns (if required)
Step 10	Conduct Additional Studies and Assessments (if required)

Step 11	Prepare Environmental Screening Report
Step 12	Publish Notice of Completion
Step 13	Resolve Elevation Requests (if required)
Step 14	Submit Statement of Completion to MECP

2.1 Amendment to Waste Management Project Regulation

O. Reg. 101/07 came into place in 2007, to ensure that the environmental effects of waste management projects are appropriately reviewed, given their potential significance. On August 8, 2023, the MECP amended the Waste Management Projects regulations (O. Reg. 101/07) in an effort to modernize the almost 50-year-old EA process that is not reflective of best practices, and that places undue burden on proponents that may not lead to environmental benefits and results in unnecessary cost from critical infrastructure projects. As part of modernizing the EA process, the MECP brought in regulatory changes that allow more projects to follow a streamlined EA process (i.e., Screening). The MECP proposed and approved updates to the thresholds for determining EA requirements for certain landfill expansions such that the following projects will be able to use the streamlined EA process for waste management projects:

– Changing a landfill to increase the total waste disposal volume by more than 100,000 m^3 and less than or equal to 375,000 m^3 if the change will increase the total waste disposal volume by less than or equal to 25%

– The Minister is the decision maker for elevation requests.

The approved revisions also state that proponents are not able to use the streamlined EA process to do a series of expansions over a defined period of time in order to avoid undertaking a Comprehensive (previously known as an Individual) EA. These amendments are captured in O. Reg. 101/07 made under the *EA Act* as well as the Guide.

Based on the approved legislative changes, BRE elected to revise the initially proposed expansion volume from 100,000 m^3 (as reported in the June 2022 Notice of Commencement) to approximately 219,400 m^3.

2.2 Screening Criteria Checklist

At the beginning of the Environmental Screening Process, the Screening Criteria Checklist (provided as Schedule I, pp 62 – 64, to the Guide) is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of “environment” contained in the *EA Act.*

As noted in the Guide:

“The Screening Criteria are presented in the form of a checklist with the option of a “Yes” or “No” response. Mitigation measures are not to be considered in concluding whether there is “No” potential environmental effect. That is, the proponent is required to answer “Yes” even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a “Yes” is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required. Where a “Yes” has been identified, the proponent is to provide additional information in the ESR, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that “No” environmental effects are anticipated, it is recommended that additional information be provided in the ESR in order to support the “no effects” conclusion”.

Each criterion is based on a question which is prefaced with the phrase, “Might the Project…”. The result of the screening level analysis is provided in Table 2.2.

Table 2.2 Screening Criteria Checklist

	Criterion	YES	NO	Additional Information
	Might the project…			
Surface and Groundwater				
1.1	Cause negative effects on surface water quality, quantities, or flow?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause potential negative effects on surface water quality, quantities, or flows.
1.2	Cause negative effects on groundwater quality, quantity, or movement?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects on groundwater quality, quantity, or movement.
1.3	Cause significant sedimentation or soil erosion or shoreline or riverbank erosion on or off site?		X	The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause some sedimentation on- or off-Site; however, it is not anticipated to be significant.
1.4	Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment.
Land				
2.1	Cause negative effects on residential, commercial, institutional, or other sensitive land uses within 500 metres from the site boundary?		X	The proposed undertaking is a continuation of the existing operation through an expansion within the existing site. No change to land use is being proposed. As such, no negative effects are anticipated on the lands or land uses within 500m the Site as a result of the Project.
2.2	Not be consistent with the Provincial Policy Statement, provincial land use or resource management plans?		X	The proposed landfill expansion will continue to be consistent with the Provincial Policy Statement, provincial land use and/or resource management plans.
2.3	Be inconsistent with municipal land use policies, plans and zoning bylaws (including municipal setbacks)?		X	The proposed landfill expansion will continue to be consistent with municipal land use policies, plans and zoning bylaws (including municipal setbacks). No new lands are required and no changes to existing zoning are required.
2.4	Use lands not zoned as industrial, heavy industrial or waste disposal?		X	The proposed landfill expansion will not require new lands or changes to existing zoning.
2.5	Use hazard lands or unstable lands subject to erosion?	X		The proposed landfill expansion may require the use of hazard lands or GRCA regulated lands.
2.6	Cause negative effects related to the remediation of contaminated land?		X	The proposed landfill expansion will not cause negative effects related to the remediation of contaminated land.
Air and Noise				
3.1	Cause negative effects on air quality due to emissions (for parameters such	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final

	Criterion	YES	NO	Additional Information
	Might the project…			
	as temperature, thermal treatment exhaust flue gas volume, nitrogen dioxide, sulphur dioxide, residual oxygen, opacity, hydrogen chloride, suspended particulates, or other contaminants)?			contours, and on-Site operations and may cause negative effects on air quality due to emissions.
3.2	Cause negative effects from the emission of greenhouse gases (e.g., carbon dioxide, carbon monoxide, methane)?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may result in a potential increase in emission of greenhouse gases associated with continued operation of the Site.
3.3	Cause negative effects from the emission of dust or odour?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may result in a potential increase in dust and odour emissions associated with continued operation of the Site.
3.4	Cause negative effects from the emission of noise?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may result in a potential increase in noise emissions associated with continued operation of the Site.
3.5	Cause light pollution from trucks or other operational activities at the site?		X	The proposed landfill expansion will not cause negative effects from light pollution.
Natural Environment				
4.1	Cause negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat?	X		The provincial Species at Risk Ontario (SARO) and federal *Species at Risk Act* (SARA) list numerous endangered, threatened, and special concern species of flora or fauna within the Study Areas. Some of these species (e.g., barn swallow [*Hirundo rustica*]) have been observed within the Site.
4.2	Cause negative effects on protected natural areas such as, ANSIs, ESAs, or other significant natural areas?		X	As there are no ANSIs, Environmentally Sensitive Areas, or other significant natural areas within the Site, the proposed expansion is not expected to cause a negative effect.
4.3	Cause negative effects on designated wetlands?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects on designated wetlands. PSWs are present within the southern boundary of the Site and throughout the adjacent lands.
4.4	Cause negative effects on wildlife habitat, populations, corridors, or movement?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects on wildlife habitats, populations, corridors, or movements. It should be noted Ministry of Northern Development, Mines, Natural Resources and Forestry (MNDMNRF) have identified Wildlife Activity Area (white-tailed deer wintering area) as being present within the Study Areas.

	Criterion	YES	NO	Additional Information
	Might the project…			
4.5	Cause negative effects on fish or their habitat, spawning, movement, or environmental conditions (e.g., water temperature, turbidity, etc.)?		X	The proposed landfill expansion will not result in negative effects on fish or their habitat, spawning, movement, or environmental conditions (e.g., water temperature, turbidity, etc.) due to lack of presence within the Site.
4.6	Cause negative effects on locally important or valued ecosystems or vegetation?		X	The proposed landfill expansion will not result in negative effects on locally important or valued ecosystems or vegetation.
4.7	Increase bird hazards within the area that could impact surrounding land uses (e.g., airports)?		X	The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations. This is unlikely to cause an increase in bird hazards.
Resources				
5.1	Result in practices inconsistent with waste studies and/or waste diversion targets (e.g., result in final disposal of materials subject to diversion programs)?		X	The proposed landfill expansion will be consistent with diversion targets.
5.2	Result in generation of energy that cannot be captured and utilized?		X	No energy recovery/ utilization is proposed.
5.3	Be located a distance from required infrastructure (such as availability to customers, markets, and other factors)?		X	The proposed landfill expansion will not change the existing landfill location.
5.4	Cause negative effects on the use of Canada Land Inventory Class 1-3, specialty crop or locally significant agricultural lands?		X	According to the Canada Land Inventory,[5] lands within the Local Study Area (LSA) are comprised of Class 2 soils (generally north and west of the Site) and Class 3 soils (generally east and south of the Site). The proposed landfill expansion will not result in any loss of soil with agricultural capability, nor would the current expansion cause negative effects on Canada Land Inventory Class 2-3 soils within the LSA. All lands on the Site are considered to be disturbed and are not rated under the Canada Land Inventory.
5.5	Cause negative effects on existing agricultural production?		X	The proposed landfill expansion will not cause negative effects on agricultural production.
Socio-Economic				
6.1	Cause negative effects on neighbourhood or community character?		X	The proposed undertaking is an expansion to an already approved and existing landfill within the existing site. As such, no negative effects on the neighbourhood or community character are anticipated on as a result of the Project.
6.2	Result in aesthetics impacts (e.g., visual and litter impacts)?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause aesthetic impacts due the increase in landfill height
6.3	Cause negative effects on local businesses, institutions, or public facilities?		X	The proposed undertaking is a continuation of the existing operation through an expansion within the existing site. No change to land use is being

5

	Criterion	YES	NO	Additional Information
	Might the project…			
				proposed. As such, no negative effects are anticipated to local businesses, institutions, or public facilities.
6.4	Cause negative effects on recreation, cottaging or tourism?		X	The proposed landfill expansion will not result in negative effects on recreation, cottaging or tourism as none of the above-mentioned uses have been identified within the Study Areas..
6.5	Cause negative effects related to increases in the demands on community services and infrastructure?		X	The proposed landfill expansion will not cause negative effects related to increases in the demands on community services and infrastructure.
6.6	Cause negative effects on the economic base of a municipality or community?		X	The proposed landfill expansion will not cause negative effects on the economic base of a municipality or community.
6.7	Cause negative effects on local employment and labour supply?		X	The proposed landfill expansion will not cause negative effects on local employment and labour supply. The continued use of the landfill will provide economic benefits to the local community in the form of new employment opportunities in both the construction and day-to-day operation. There is also the potential for increased employment opportunities in local firms.
6.8	Cause negative effects related to traffic?	X		The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects related to traffic through prolonging the life of the Site.
6.9	Be located within 8 km of an aerodrome/airport reference point?	X		Three aerodromes have been identified within 8km of the Site: Cayuga (Bruce Field), approximately 1.3 km south of the Site Cayuga East, approximately 3 km southeast of the Site Grand River Executive, approximately 7.5 km north of the Site
6.10	Interfere with flight paths due to the construction of facilities with height (i.e., stacks)?		X	The proposed landfill expansion will not interfere with flight paths.
6.11	Cause negative effects on public health and safety?		X	The proposed landfill expansion would not cause any negative effects on public health and safety.
Heritage and Culture				
7.1	Cause negative effects on heritage buildings, structures or sites, archaeological sites or areas of archaeological importance, or cultural heritage landscapes?		X	The entire Site has been subjected to recent, extensive and intensive disturbance and it is therefore considered that the Site does not have any heritage, cultural and archaeological potential that will be negatively affected by the expansion. While there are areas within the Local Study Area (LSA) that may have heritage, cultural archaeological potential, these areas will not be disturbed by the proposed expansion.

	Criterion	YES	NO	Additional Information
	Might the project…			
7.2	Cause negative effects on scenic or aesthetically pleasing landscapes or views?	X		The proposed vertical and horizontal landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects on scenic or aesthetically pleasing landscapes or views.
Aboriginal				
8.1	Cause negative effects on land, resources, traditional activities, or other interests of Aboriginal communities?		X	Consultation with Indigenous communities will take place throughout the Environmental Screening Process.
Other				
9.1	Result in the creation of non-hazardous waste materials requiring disposal?		X	The proposed landfill expansion will not change the types of wastes the facility is permitted to receive and will not result in the creation of non-hazardous waste materials requiring disposal (the landfill currently receives non-hazardous wastes as permitted by the existing Environmental Compliance Approval).
9.2	Result in the creation of hazardous waste materials requiring disposal?		X	The proposed landfill expansion will not change the types of wastes the facility is permitted to receive and will would not result in the creation of hazardous waste materials requiring disposal (the landfill currently receives non-hazardous wastes as permitted by the existing Environmental Compliance Approval).
9.3	Cause any other negative environmental effects not covered by the criteria outlined above?		X	The proposed landfill expansion will not cause any other negative environmental effects not covered by the criteria outlined above.

3. Description of the Existing Environment

This section documents the existing conditions (i.e., what exists in absence of the proposed Project) in the context of the discipline-specific criteria included in the Screening Criteria Checklist (see Table 2.2, above) within the Study Areas defined for each discipline.

3.1 Surface Water Existing Conditions

3.1.1 Study Area

The Surface Water Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **Site Study Area (SSA)**: Including all lands (i.e., 14.3 ha)) within the existing, approved boundaries of the Site as defined by ECA No. A110302, as amended

– **Local Study Area (LSA)**: Including all lands and waters within a 1 kilometre (km) radius of the SSA boundaries including agricultural, residential, and municipal properties

3.1.2 Methodology

3.1.2.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Surface Water Study Team to determine existing surface water conditions within the Study Areas. The following sources of secondary information were collected and reviewed:

- MECP Stormwater Management Planning and Design Manual (MECP, March 2003)
- Stormwater Management (SWM) Plan (Conestoga-Rovers & Associates (CRA), September 2013)
- Surface Water (SW) Resources Assessment Report for the Brooks Road Landfill Site, Vertical Capacity Expansion Environmental Assessment (GHD, July 2016)
- Design and Operation (D & O) Report Landfill Expansion Report 81 Revision 1 (GHD, June 2021)
- 2021 Operations and Monitoring (O & M) Report, Brooks Road Landfill Site (GHD, March 2022)

3.1.3 Process Undertaken

The process undertaken for the Surface Water Assessment on the Site includes the following:

- Background Review
- Existing Site Conditions Review
- Field Investigation Review (based on the current surface water monitoring program)
- Proposed Expansion Assessment
- Potential effects, mitigation measures and net effect analysis

3.1.4 Description of Surface Water Existing Conditions

The on-Site drainage patterns are similar to those described in the SWM Plan (2013) and SW Resources Assessment Report (2016). The Site stormwater management practices currently operate under Amended ECA Nos. 1122- BKUPSM, issued in February 2020. The Site drainage network is being configured to the Post Closure Condition, illustrated on Figure 5 of the 2013 SWM Plan. The SWM Plan and SW Resources Assessment are provided in the Surface Water Assessment Report (see **Appendix A**).

The LSA includes slough forest, woodlot, agricultural, residential, and municipal properties. The on-Site topography is very flat with a slight 0.003 metre/metre (m/m) horizontal gradient to the south. The topography across the LSA from north to south ranges from approximately 202 m above mean seal level (AMSL) to approximately 196 m AMSL.

The existing SWM measures within the Site, as described in the SWM Plan and D&O report, include the following:

- Site stormwater runoff is discharged from two outfalls. Runoff from the undeveloped area of land located at the south-east corner of the Site (catchment 100) discharges through Outfall 1. The remainder of the Site discharges through Outfall 2. The existing flow schematic is presented on **Figure 3.2.**
- The majority of the Site areas discharge to the existing SWM pond through perimeter ditches including final cover areas (Catchments 201-204), areas between the landfill perimeter access road and the visual screening berms to the north and west (Catchments 205-206), segregated recyclable material storage areas, Site trailers, scales (Catchments 207-208) and areas that encompass the pond (Catchments 209-210).
- The rest of the Site areas, which are largely undeveloped (Catchments 301-303), discharge towards Outfall 2.

210	0.43	10	100	0.43	98
Total	10.31				

Source*: Stormwater Management Plan 2013 (Table 3)

The existing stormwater controls on Site include drainage ditches and the SWM Pond, which are summarized in subsequent sections.

Although the Site is on the boundary of two watersheds and the conditions are primarily ephemeral, the surface water drainage pattern meanders through road-side ditches, farmland, and Norton's Creek to the Grand River, located approximately 7 km from the Site.

3.1.4.1 Monitoring Program

As specified in the Landfill ECA, a surface water monitoring program was developed to assess the surface water quality within the Site and downstream of the Site to ensure compliance with the ECA requirements, Water Management Policies, Guidelines, Provincial Water Quality Objectives (PWQO), published by the MECP in July 1994, and reprinted February 1999. The current surface water monitoring program includes monitoring of surface water quality and quantity, through water sampling and flow rate measurements, respectively.

The surface water monitoring network is currently comprised of nine monitoring locations (see **Figure 3.3**) which includes the following:

– Three off-Site background locations: SW1, SW8, and SW9. All three have been established to document the background water quality in the local ditches and ponds. SW9 is located immediately north of the Site, north of OW3A/B-13 monitoring well.
– Two on-Site surface water monitoring locations: include one pond (SW5) located in the southern portion of the Site and one on-Site surface water ditch (SW2) located at the discharge from the surface water management system (SWMS).
– Four off-Site surface water monitoring locations: include two ponds (SW6 and SW7) located to the south of the Site; one drainage ditch located immediately downstream of the Site discharge point (SW3), and one drainage ditch (SW4) situated approximately 1 km south and downstream of the Site along Highway No. 3.

Water quality monitoring and surface water flow measurements at all surface water stations is scheduled to take place on a quarterly basis in March, May, August, and November. An attempt is made to correlate the surface water

monitoring with rainfall events. As such, the John C. Munro Hamilton International Airport in Mount Hope, ON Hamilton Airport), located approximately 24 km to the north, is often used to schedule surface water monitoring events.

The comprehensive list of specific surface water parameters analyzed during the monitoring program includes:

– General parameters: Alkalinity, conductivity, chloride, ammonia, nitrate, nitrite, TKN, total phosphorus, TDS, pH, TSS, sulphate, BOD5, COD, phenol, pH
– Metals: arsenic, barium, boron, cadmium, chromium, iron, lead, mercury, copper, zinc
– Organics: ethylbenzene, benzo(a)pyrene, naphthalene
– Field parameters: conductivity, pH, temperature, and dissolved oxygen

The parameter list for the current monitoring period (2021) is provided in Table 5.7 of the 2021 O&M report.

3.2 Geology & Hydrogeology Existing Conditions

3.2.1 Study Area

The Geology and Hydrogeology Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **SSA**: Including all lands (i.e., 14.3 ha) within the existing, approved boundaries of the Site as defined by ECA No. A110302, as amended
– **LSA**: Including all lands and waters within a 1 km radius of the SSA boundaries including agricultural, residential, and municipal properties

3.2.3 Description of Geology & Hydrogeology Existing Conditions

The Site is situated on the Haldimand Clay Plain[6] approximately 2 km northeast of the Town of Cayuga. The Site is relatively flat. The regional topography is generally flat with a gentle slope to the south towards Lake Erie. The elevation of the Site is approximately 200 m AMSL[7]. A Site location map, which includes regional elevations, is included as **Figure 3.5**.

A review of soil surveys indicates that the surficial soils in the LSA are classified as mainly lacustrine silty clay[8]. A review of the quaternary geology in the LSA indicates that the area is generally underlain by glaciolacustrine clay and silt[9]. Published bedrock topography mapping indicates a bedrock elevation of approximately 182.5 m AMSL in the vicinity of the Site[10]. The bedrock geology in the LSA and underlying the Site is comprised of argillaceous dolostone, shale, and evaporites of the Salina Formation[11].

3.2.3.1 Site Geology

The overburden geology is relatively uniform beneath the Site. In general, the Site is characterized by a thick (14 to 18 m) glaciolacustrine layer of stratified silty clay, silty clay till and varved clays, underlain by a thin (1 to 3 m) discontinuous layer of silty sand till with varying proportions of gravel and clay. The bedrock has been encountered at depths varying from 15.2 to 20.2 m below ground surface (BGS). A thin surficial deposit of topsoil is generally observed at the surface of the Site, with the exception of the southwestern portion.

The silty clay deposits are described as being locally fractured (weathered) from the surface down to depths varying from 3 to 5 m BGS and are characterized as a very stiff to hard with low plasticity. At depths more than 5 m, the silty clay deposits have little to no fracturing and the consistency of the units increase from stiff to very stiff.

Underlying the silty clay deposits, a thin discontinuous silty sand till with varying proportions of clay and gravel is encountered across the Site. The silty sand till ranges in thickness from 1 to 3 m and often contains cobbles and/or broken angular bedrock fragments. This deposit is usually well graded with fine to medium grained sand, minor silt and trace clay, and is described as dense to compact, grey, and saturated. The silty sand till rests directly over the bedrock.

Bedrock underlying the Site has been described as a fractured shale, dolostone and gypsum of the Salina Formation. The top of bedrock elevation ranges from 180.8 to 187.0 m AMSL and forms a small bedrock valley from northwest to southeast across the Site. The valley is characterized by a thicker silty sand till deposit. Regionally, the bedrock topography dips to the south.

3.2.3.2 Site Hydrogeology

In general, the geologic units identified at the Site may be grouped into two main hydrogeologic units separated by the thick silty clay aquitard unit, as follows:

i) An unconfined water table (shallow overburden) unit within shallow fractured silty clay (weathered) unit

ii) Silty clay aquitard

iii) A confined basal till overburden/shallow bedrock aquifer

These two hydrogeological units are separated by a thick (between 9 and 12 m) layer of stratified silty clay, silty clay till, and varved clays which form a continuous aquitard of very low hydraulic conductivity. Groundwater level data historically gathered from the shallow overburden unit and basal overburden/shallow bedrock aquifer indicate that the clay aquitard provides hydraulic separation between the two units. Differences in hydraulic head between the two units have varied between 9.5 to 15 m as historically measured at the location of nested wells. The vertical hydraulic gradient between the two hydrogeologic units is downward.

Based on historical groundwater level data, the shallow overburden unit is generally encountered at depths varying from 0.5 to 4 m BGS across the Site. The shallow overburden unit is an unconfined water table unit, which overlies the impermeable un-weathered silty clay unit. Based on the shallow overburden monitoring wells monitored in 2021, groundwater flow in this unit is generally towards the south towards Lake Erie.

Underlying the silty clay aquitard, a confined basal overburden/shallow bedrock aquifer has been observed within the lower portion of the silty sand till unit and the shallow fractured bedrock. Groundwater quality and water level data indicate that the lower silty sand till unit and the shallow fractured portion of the bedrock are hydraulically connected and geochemically similar. Therefore, these two geological units have been considered to form one aquifer.

Based on the groundwater data obtained to date, the basal overburden/shallow bedrock aquifer is generally encountered at depths varying from 14 to 17 m BGS. The groundwater flow pattern in this aquifer is in a south to southwest direction with a relatively flat horizontal hydraulic gradient.

3.2.3.3 Natural Gas Deposits and Natural Gas Wells

A review of oil, gas and salt resource mapping in Ontario indicates that several active and plugged gas wells are located within the LSA. No active/plugged gas wells were identified on the Site, however, research indicates that 23 current and former gas wells are located within the LSA. A total of 16 gas wells have been identified as abandoned, of which 15 have been identified as plugged, and a total of seven gas wells that may be active, suspended, or abandoned are found within the LSA. The gas wells all targeted the Haldimand Pool within the Clinton Group and were drilled to a total depth (true vertical depth) ranging from 207.6 to 229.5 m BGS at approximately the top of the Queenston Formation. A natural gas pipeline is also located approximately 400 m south of the Site. A list of the Ontario Oil and Gas Wells located within the LSA is itemized in Table 3.1 of the Geology and Hydrogeology Assessment Report (see **Appendix B**) and a reference Figure is attached as **Figure 3.6**.

Due to the depths of the natural gas wells, it is not anticipated that there will be any influence from the landfill on the natural gas wells.

3.2.3.4 Mining Claims and Abandoned Mines

A review of the Ministry of Northern Development, Mines, Natural Resources and Forestry information for abandoned mines and mining claims was completed. No mining claims were identified within the SSA, however one abandoned mine was identified within the LSA to the northwest of the Site (AMIS File # 04888 / MDI # MDI30L13NW00003). The mine was reviewed in a CRA report entitled Well Survey and Limited Hydrogeological Assessment, dated July 2004 (2004 Report). The 2004 Report indicates two documents were reviewed: Gypsum in Ontario, C.R.Guillet, dated 1964, and Abandoned Mines Hazard Abatement Program, London District Site Examinations, prepared by Patrick Chance & Associates Consulting Geologists, dated 1994 (1994 Inspection). The information presented below was gathered from the above-referenced reports and has been revised with the most current information available including information from the Gypsum Mine Investigation Report prepared by GHD that provides an assessment of potential influences of the former Cayuga Gypsum Mine on groundwater at the landfill Site.

The former gypsum mine was operated by the Cayuga Gypsum Company Limited between 1942 and 1949. Gypsum was mined from a 0.9 m thick bed at a depth of 25.9 m BGS.

Mining operations were accomplished via two mine shafts. The first shaft was located approximately 112 m south of Townline Road and 350 m west of Brooks Road. The former shaft can reportedly be located by a 2.4 m deep depression, with a footprint of 3 by 4.6 m. The shaft was a vertical prospect shaft of unknown support and was back-filled with unknown materials. The 1994 Inspection did not document any evidence of subsidence, however the report recommended that a 50 m radius area of caution be observed in the vicinity of this shaft.

Based on the available historical documentation, approximately 10,300 tonnes of gypsum were reportedly removed from this prospect shaft during the operation of the mine. With a density of 2.3 tonnes/m^3 and a thickness of 1 m, this would correspond to lateral workings with an aerial footprint of approximately 4,356 square metres (m^2). In order to access the gypsum in the 1 m seam, it is likely that approximately 1 to 2 m of the overlying shale bedrock would also have been removed.

The second shaft was located approximately 305 m south of the first shaft. The 1994 inspection was reportedly unable to locate the second shaft. The second shaft was also a vertical prospect shaft of unknown support and it is unknown if the shaft has been back-filled. It is not known how much gypsum was removed from this shaft.

Due to property access restrictions, an inspection of the former Cayuga Gypsum Mine could not be conducted.

During the operation of the mine from 1942 to 1949, dewatering operations would likely have been conducted to keep the mine shafts and associated galleries dry. As such, during the operation of the mine the local groundwater flow would have been influenced by mine dewatering activities. Active removal of large quantities of groundwater from the bedrock would have resulted in inward hydraulic gradients. As such, the bedrock groundwater flow in the vicinity of the former mine would have been directed towards the active galleries during operation of the mine.

Upon closure of the mine in 1949, the dewatering activities at the mine would have ceased and the associated mine shafts and galleries would have flooded within the first year of closure. The mine has now been abandoned for 67 years. Since the former galleries and shafts are flooded, no water deficit should be present between these former underground structures and the surrounding bedrock. Thus, essentially steady state conditions should exist and the former underground structures will no longer have a hydraulic influence on the local bedrock aquifer.

In the unlikely event that the former mine shafts would not have been properly sealed following closure of the mine, there could exist the potential for surface water and groundwater in the shallow overburden to enter the mine shafts and migrate to the underlying bedrock aquifer. If infiltration were occurring, the shafts would be acting as a sink to the overburden groundwater and a source of recharge to the local bedrock groundwater. This would result in a cone of depression in the overburden groundwater towards the former mine shafts and radial flow from the galleries in the bedrock groundwater. Under this scenario there could be a potential for bedrock groundwater flow being diverted away from the former galleries. However, based on the relatively small dimension of the former galleries (areal extent of approximately 4,356 m^2) it is expected that any influence of these galleries on the bedrock aquifer would be localized to the immediate vicinity of the former galleries. Bedrock aquifer influence beyond the limits of the former Cayuga Gypsum Mine property is anticipated to be negligible.

The Gypsum Mine Investigation Report reviewed information related to historical mining operations including location and extent of mining activities, review of physical Site conditions for evidence of historical mining operations, and an evaluation of hydraulic gradients within the available monitoring network to identify potential evidence of a hydraulic influence on horizontal or vertical gradients in the vicinity of the Site. The report concluded that there is no evidence of an influence related to the former Cayuga Gypsum Mine on the bedrock aquifer at the Landfill Site.

3.2.3.5 Other Data Sources

A review of the Ontario Geological Survey Karst of Southern Ontario and Manitoulin Island report indicates that no potentially karst, inferred karst, or known karst bedrock has been identified within the Study Areas[12]. Furthermore, the groundwater conditions are unfavourable for the dissolution of the bedrock and the Upper Silurian bedrock consists of generally argillaceous dolostone, shale, and evaporites (primarily gypsum), the latter of which precludes the formation of large-scale karst features. Furthermore, no sink holes or caving features have been identified in the study area.

3.3 Land Use & Socio-Economic Existing Conditions

3.3.1 Study Area

The Land Use and Socio-Economic Study Areas to be discussed in relation to the preparation of this ESR are as follows:

- **SSA** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
- **Site-Vicinity Study Area** – the area within the vicinity of the Site extending approximately 500 m in all directions
- **LSA** – the area within the vicinity of the Site extending approximately 1 km in all directions from the SSA boundaries

3.3.2 Methodology

3.3.2.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Land Use Study Team to determine existing Land Use conditions within the study area(s). The following sources of secondary information were collected and reviewed:

- Review of current zoning plans, definitions, and land use designations
- Ontario Planning Act
- Provincial Policy Statement (2020)
- Provincial Guidelines D-1: Land Use Compatibility
- Haldimand County Official Plan (2019)
- Haldimand County Zoning By-Law HC 1-2020
- Grand River Conservation Authority
- Statistics Canada (2021 Census Data)
- Land Use Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment report prepared by GHD in December 2016

3.3.3 Description of Land Use & Socio-Economic Existing Conditions

The existing land uses around the Site are primarily agricultural and wetlands. The Site is bordered by Brooks Road to the west, and agricultural and wetland areas to the other three sides. There is an abandoned railway corridor that runs east-west to the north of the Site.

3.3.3.1 Sensitive Uses Within 500 Metres

Sensitive land uses are defined in the Provincial Policy Statement (PPS), 2020 as "*buildings, amenity areas, or outdoor spaces where routine or normal activities occurring at reasonably expected times would experience one or more adverse effects from contaminant discharges generated by a nearby major facility. Sensitive land uses may be a part of the natural or built environment. Examples may include, but are not limited to residences, day care centers, and educational and health facilities.*"

The existing Site is located at 160 Brooks Road, in Cayuga, Haldimand County, Ontario. The proposed expansion will take place within the Site boundaries and will not require use of any new lands. There are two identified residential properties located within the Site Vicinity Study Area, the closest is approximately 223 m northwest of the site. There are no identified institutional or recreational land uses in a 500 meters radius of the Site boundary.

3.3.3.2 Provincial Policy Statement

The PPS, 2020[13] provides clear policy direction on land use planning to promote strong communities, a strong economy, and a clean and healthy environment[14]. In terms of land use compatibility, the PPS 2020 (Section 1.2.6.1) states that "*Major facilities and sensitive land uses shall be planned and developed to avoid, or if avoidance is not possible, minimize and mitigate any potential adverse effects from odour, noise and other contaminants, minimize risk to public health and safety, and to ensure the long-term operational and economic viability of major facilities in accordance with provincial guidelines, standards and procedures*".

The PPS 2020 defines 'major facilities' as facilities which may require separation from sensitive land uses (as defined in Section 3.1.2.1, above), including but not limited to airports, manufacturing uses, transportation infrastructure and corridors, rail facilities, marine facilities, sewage treatment facilities, waste management systems, oil and gas pipelines, industries, energy generation facilities and transmission systems, and resource extraction activities.

Section 1.6.10.1 of the PPS 2020 notes that "*waste management systems need to be provided that are of an appropriate size and type to accommodate present and future requirements, and facilitate, encourage and promote reduction, reuse and recycling objectives… [and that] waste management systems shall be located and designed in accordance with provincial legislation and standards.*"

The on-Site, Site-Vicinity, and Local Study Areas are currently in compliance with the policies contained in the PPS 2020.

3.3.3.3 Grand River Conservation Authority (GRCA) Regulation

In accordance with O. Reg. 150/06, GRCA regulates areas where development could be subject to flooding, erosion or dynamic beaches, and where interference with wetlands and alterations to shorelines and watercourses might adversely affect those environmental features. Any of these activities within the Regulated Area may require a permit from the GRCA[15].

A portion of the Site area falls within the GRCA regulated area (**Figure 3.8**) and may require a permit.

[13] **Provincial Policy Statement, 2020 - Under the Planning Act (ontario.ca)**
[14] It should be noted that the PPS was recently updated, and the proposed changes (PPS, 2023) were out for public consultation until August 4, 2023. The proposed changes do not impact the PPS analysis.

3.3.3.4 Planned Developments

There are currently no planned or proposed developments surrounding the Site[16].

3.3.3.5 Municipal Land Use Policies, Plans, Zoning Bylaws

The Study Areas are situated within the unincorporated community of Cayuga in Haldimand County. The County's Official Plan and Zoning By-Laws were reviewed to determine how the land in the Study Areas may be used in the future based on municipal planning policy.

The predominance of agriculture as the primary designated land use in the Study Areas is expected to remain for the foreseeable future with very little change based on the current municipal planning policy espoused by the County of Haldimand.

Haldimand County Official Plan (HCOP)

The SSA is designated as Active Waste Landfill Site and surrounding is PSWs and Agriculture.

Provincially Significant Wetlands – There are delineated PSWs within the SSA, Site-Vicinity Study Area, and LSA. As per Section 2. A. 1) of the HCOP, certain compatible uses may be permitted through an appropriately scoped Environmental Impact Study resulting in no negative impact on the natural features or ecological functions of wetland or wetland complex.

Agriculture – Majority of the Site-Vicinity Study Area is designated agricultural. As per Section 3. A. 1) of the HCOP, the predominant use of lands within the agriculture designation shall be agriculture. Other uses compatible with agriculture such as animal kennels, forestry uses, and conservation related uses may be permitted.

HCOP 34 (Specific policies in Haldimand County) – The abandoned railway, located north of the existing landfill is under the HCOP 34 policy area. A waste disposal site is permitted in addition to the uses permitted in the agricultural designation. The permitted uses under waste disposal site are limited to stockpiling of clean clay, location of ground waste monitoring wells, and a general naturalized buffer area. Waste disposal or landfilling is not permitted in this designation.

Hal 36 (Policies in the former town of Haldimand) – As per Hal 36, policies in the Official Plan relating to PSWs (Section 2. A. 1)), and Natural Environment Areas (Section 2. A. 3)) will not apply to the Brooks Road Landfill (formerly known as Edwards Landfill Site).

Haldimand County Zoning By-Law HC 1-2020

Haldimand County zones the subject site as Disposal Industrial (MD) and Wetland (W). The land in the LSA is zoned as Agricultural (A) and Wetland (W). (see **Figure 3.9**).

Disposal Industrial

The SSA is zoned as Disposal Industrial. The permitted uses include waste disposal site, waste transfer site, and waste processing facility along with other compatible uses.

Wetland

A portion of the SSA and majority of the Site-Vicinity Study Area and LSA is zoned as Wetland (W). The permitted uses include parks, woodlot management, conservation area, and tent and trailer park. Under section 12.2, Hal 36.325 (Zone Exceptions) of the zoning by-law, the minimum setbacks form the wetland Zone shall not apply to the commercial buildings existing on the date of passing of the by-law.

[16] Haldimand County Planning Applications. Available at: **https://haldimand.maps.arcgis.com/apps/dashboards/945e90b55d484fd0a01253953129dc0f**

Agricultural

A larger portion of the Site-Vicinity Study Area and the LSA is zoned as agricultural. Permitted uses in the Agricultural Zone include residential (bed and breakfast establishments, single detached dwellings, and several accessory uses), agricultural, and commercial (animal hospital, animal kennel, commercial greenhouse) uses.

3.3.3.6 Neighbourhood & Community Character

The Site is located within the community of Cayuga in Haldimand County and is designated as an Active Waste Disposal Site within the Haldimand County Official Plan and zoned Disposal Industrial (MD) and Wetlands (W) in the Haldimand County Zoning By-law.

Haldimand County is situated within the Golden Horseshoe region of Ontario. The community is comprised of 1,251 km² of rural landscape, including 83 km of shoreline along Lake Erie.

According to the 2021 Census[17], the County recorded a population of 49,216 in 2021, which is projected to increase to between 67,000 and 68,000 by 2041[18]. The age groups with the largest representation are the 55-59 and 60-64 cohorts. There is an equal distribution of males and females throughout the age groups and a greater part of the households fall within the income bracket of $150kand above. About 4% of total population is Indigenous, largely First Nations and Métis, and 3% are visible minorities, with South Asian and Black visible minority groups more represented than other groups.

Almost half of the total population has completed high school and college education. Common fields of study include engineering, business management, and health related fields. A major portion of the labour force is in the manufacturing, health care, and construction industries. The employment rate was about 56% in 2021 with an unemployment rate of 8.3% in the same year.

Eighty-five percent of residents own their home and 15% are renters. The new housing construction projects has increased from 2020[19]. Forty-nine projects under construction and 101 completed projects were reported in the fourth quarter of 2022.

The closest residential dwelling is located approximately 223 m northwest of the Site (see Figure 3.10).

3.3.3.7 Visual

The existing visual landscape within the SSA, Site-Vicinity Study Area, and LSA can be described as rural, agricultural, and includes regional roads. There is a wire fence around the perimeter of the site The western part of the existing Site located on Books Road has a visual berm which includes a chain link fence with visual screen as mitigation to visual impact, providing a visual barrier to passersby.

3.3.3.8 Local Businesses, Institutions or Public Facilities

In addition to farming, the only other business operating within the LSA is the Brooks Road Landfill Site, which employs six full-time and one part-time staff. The are no other businesses, institutions or public facilities located within the LSA.

3.3.3.9 Local Employment & Labor Supply

According to the 2021 Census[20], there are total 24,335 residents in the labour force, of which 20,645 are employees and 3,675 are self-employed. Majority of the employed are in trade and transport occupations (26%); sales and services (22%); business and finance (14%); education, law, and government (10%); and healthcare (8%). The employment rate in 2021 was 56.6% and the participation rate was 61.8%. The unemployment rate was recorded to be 8.3% in the same year.

A major part of the labour force is into manufacturing, health care, and construction industry. The employment rate was about 56% in 2021 with 8.3% of unemployment rate in the same year.

The Brooks Road Landfill Site employs six full-time and one part-time staff.

3.3.3.10 Traffic

Highway 3 and Brooks Road are the two major roads providing access to the existing Brooks Landfill. Traffic on Brooks Road is predominantly truck traffic specific to the landfill operation. Traffic on Highway 3 is a mix of both commuter and truck traffic. The capacity analysis under peak operations confirms no current capacity constraints in the LSA road network. Further details on traffic (existing conditions and potential effects) are included in the Transportation Assessment Report, prepared concurrently with this report by GHD (see **Appendix H**).

3.3.3.11 Social

The LSA is located within the boundaries of Haldimand County, Ontario, approximately 2 km northeast the Village of Cayuga. There are 39 property parcels within the LSA (not including the Site) and 11 residential dwellings. Of these 39 properties, 19 were Farm Tax Rated for the 2022 tax year[21]. The closest residential dwelling is located approximately 223 m northwest of the Site.

No static recreational resources (e.g., picnic areas, trailer parks), churches, or cemeteries are located within the LSA; however, Brooks Road as well as the abandoned railway to south of the Site (parallel to Highway 3) are identified in the Official Plan as trail locations and in the Haldimand County Trails Master Plan 2009 as “Proposed Special Use Routes” (Brooks Road as a “Proposed Signed Route” and the abandoned railway as a Proposed Multi-Use Trail”) for implementation in the short-term (0 to 5 years from the publication date). There is presently no indication of the implementation of the proposed trails along either of these routes.

The topography across the LSA from north to south ranges from approximately 202 m AMSL to approximately 196 m AMSL. As such, the land within the LSA can be considered to be relatively flat. The majority of the lands within the LSA immediately adjacent to the Site are forested, thus obscuring the view of the Site. The exception is the parcel of land immediately west of the Site, which includes an open field, from which the Site is visible; however, the existing berm along the western perimeter of the Site obscures most views of the landfilling operations from this parcel. The

[20] **Census of Population (statcan.gc.ca)**
[21] Government of Ontario. (2022). *AgMaps – Agricultural Information Atlas*. Source: **AgMaps (gov.on.ca)**

existing visual berm includes a chain link fence with visual screen as mitigation to visual impact, providing a visual barrier to passersby from Brooks Road.

3.3.3.12 Airport

There are three private airfields within the 8 km radius of the Site: the Cayuga (Bruce Field) Airport, approximately 1.5 km south; the Cayuga East Airport, approximately 3 km southeast; and the Grand River Executive Airport (also referred to as the York Airport) approximately 7.5 km north of the Site.

See **Appendix C** for a detailed Land Use and Socio-Economic Assessment Report.

3.4 Air Quality Existing Conditions

3.4.1 Study Area

The Air Quality Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **SSA** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– **LSA** – the area within the vicinity of the Site extending approximately 1 km in all directions from the SSA boundaries

3.4.2 Methodology

3.4.2.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Air Quality and Odour Study Team to determine existing Air Quality and Odour conditions within the Study Areas. The following sources of secondary information were collected and reviewed:

- Environment Canada Climate data (2017 to 2021).
- Ambient air quality data obtained from the Hamilton Air Monitoring Network (HAMN) (2019 to 2021). Note that the $PM_{2.5}$ data available from the closest monitoring station #29102 at Hamilton was used in the net effects assessment for a cumulative particulate evaluation.
- Existing Facility Emission Summary and Dispersion Modelling Report, prepared for BRE by CRA (September 14, 2015 and updated September 2022).
- Odour Monitoring Program, prepared for BRE by CRA (July 28, 2014).
- Odour Monitoring Program, prepared for BRE by CRA (November 3, 2014).
- Odour Monitoring Program, prepared for BRE by GHD (2016,2017, 2019 and 2022).

3.4.2.2 Process Undertaken

On-Site and off-Site odour investigations were completed by GHD in 2014, 2016, 2017, 2019 and 2022. These studies indicated that there was no measurable odour off-Site. GHD completed odour measurements during daytime and night-time periods to try and observe odours in the surrounding community. During all the odour monitoring events, no odours that could be attributed to the Site were detected off-site.

The GHD Team completed a walk-through of the Site, with focused observations at the location of the proposed horizontal expansion to the north and the leachate system. GHD did not identify any fugitive emissions during the walkthrough other than minor particulate emissions generated by small vehicles moving throughout the landfill. The GHD Team also observed the area surrounding the Site to confirm the locations of the nearest sensitive receptors to the Brooks Road Landfill.

3.4.3 Description of Air Quality Existing Conditions

The following conditions are currently present at the Site, as described in **Table 3.2**.

Table 3.2 Existing Conditions Relevant to Air Quality and Odour

Attribute	Existing Landfill
General Description	Expanding the current capacity by 219,400 m^3
Footprint Area (ha)	6.07
Peak Elevation – top of waste (mAMSL)	220.75
Maximum Daily Truck Traffic	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day

3.4.4 Hamilton Climate Station

The Hamilton Climate Station is a weather station located at Hamilton's John C. Munro International Airport (43.1N, 79.5W, elevation 237.7 m). The station has been operating since January 15, 1970 under World Meteorological Organization (WMO) ID 71263. The Hamilton Climate Station was selected as it is the closest representative station to the Site that has hourly documented climate data since 2010. Data from this station is published online at Environment

and Climate Change Canada's National Climate Data and Information Archive. Hourly data from the station was analyzed to determine prevalent atmospheric conditions that are considered representative of the Site.

Figure 3.12 presents a five-year wind rose for the Hamilton Climate Station for the period between 2017 and 2021 and **Figure 3.13** presents the wind class frequency distribution. The dominant wind directions, as shown on **Figure 3.12**, are from the southwest, and northeast.

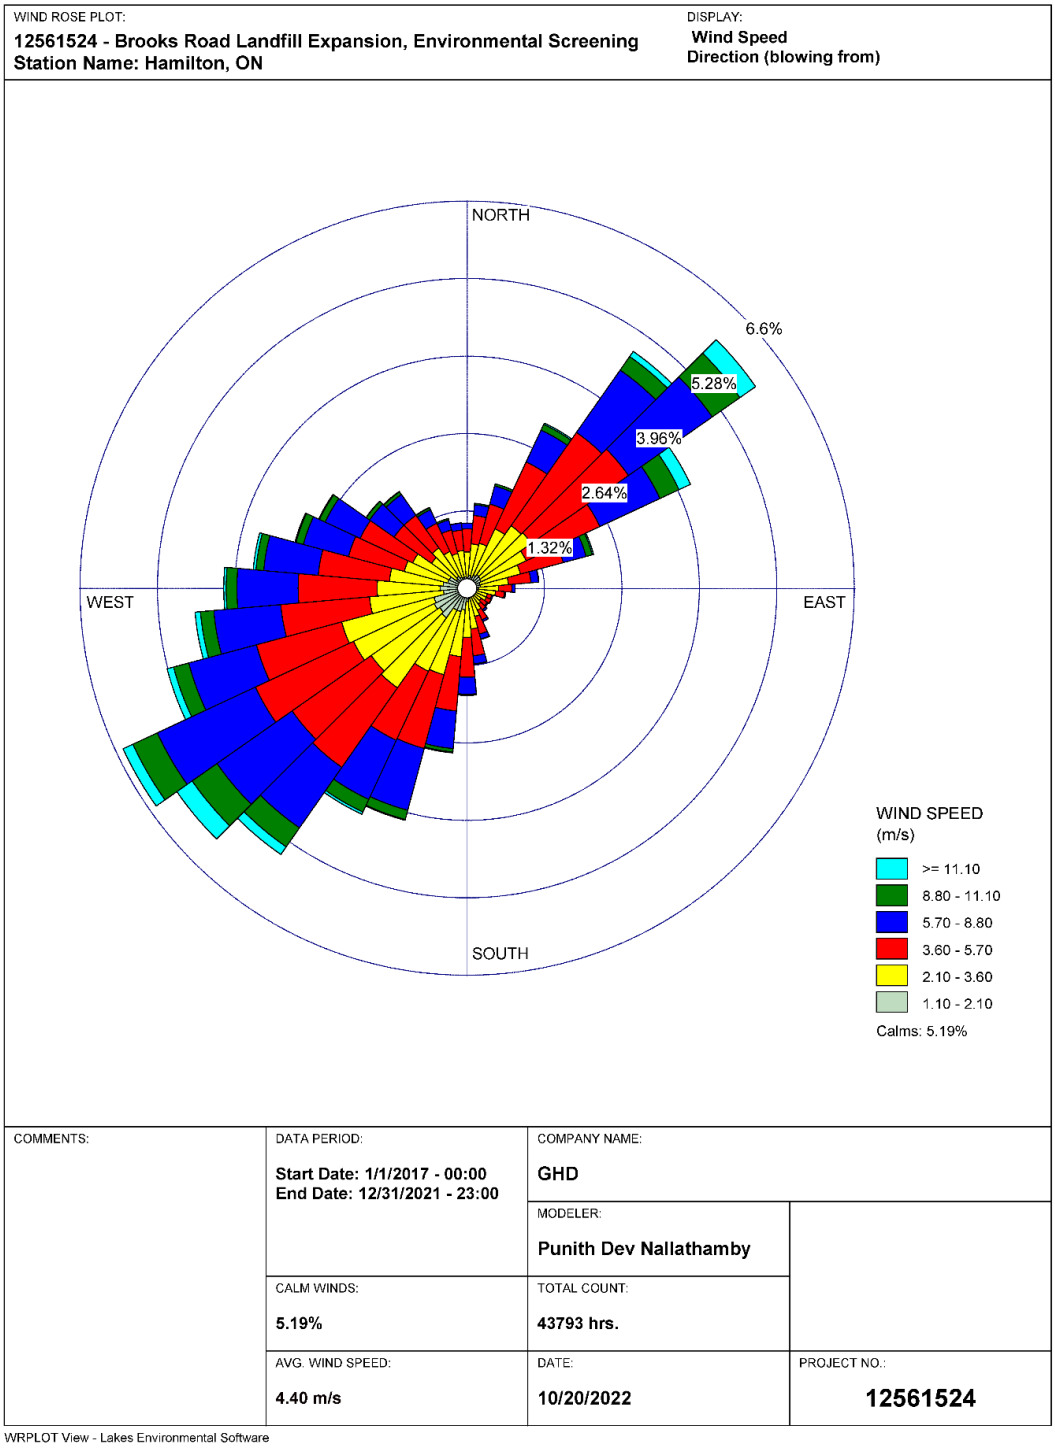

Figure 3.12 Wind Rose, Hamilton AP (2017 – 2021)

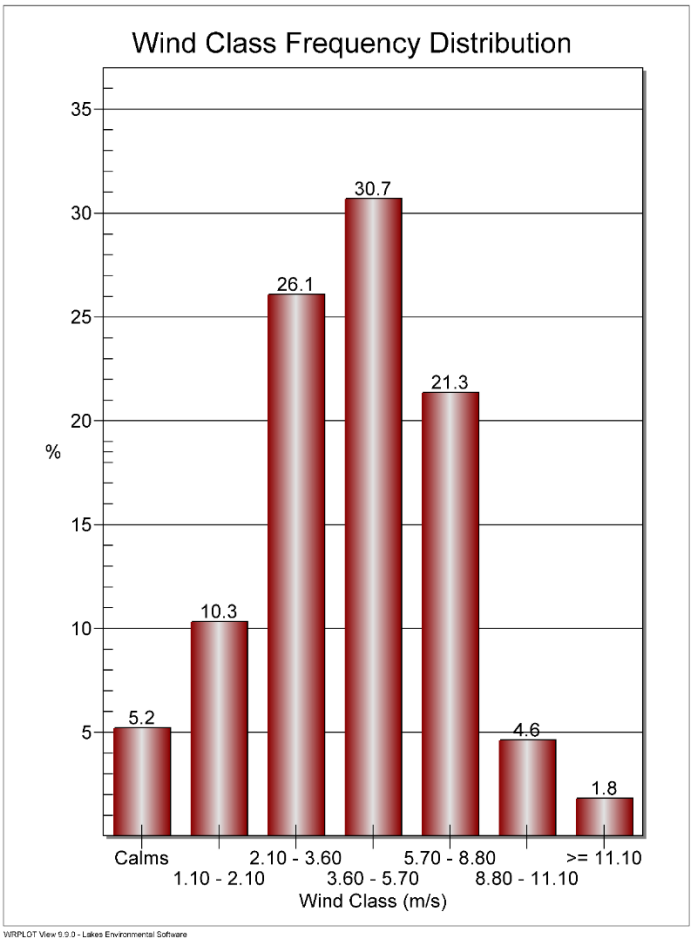

Figure 3.13 Wind Class Frequency Distribution

3.4.4.1 Air Quality

The Site is located approximately 2.8 km northeast of Cayuga and 25 km south of Hamilton and is surrounded by agricultural land. The closest receptor (as per the August 2022 Odour Management Plan) is approximately 223 m from the Site and there are no major industrial sources within the Study Areas. The Site has a berm that runs along the west side of the Site and a clay stockpile located along the north side that reduces the line of sight and fugitive particulate matter emissions when the Site is in operation.

3.4.4.2 Vehicle Emissions

Particulate emissions related to vehicles operating at the landfill are the primary emissions of concern at the Site. Particulate may be defined in various particle size categories; including total suspended particulate (TSP), particulate less than 10 microns (PM_{10}) and particulate less than 2.5 microns ($PM_{2.5}$). All fractions of particulate were previously assessed for the potential landfill emissions. There is no change in the TSP, PM_{10}, or $PM_{2.5}$ emissions from the previous assessment as the proposed operations were assessed and fugitive dust management plans implemented.

3.4.4.3 Indicator Compounds

As identified above, TSP, PM_{10}, and $PM_{2.5}$ were previously included in the assessment as they are the primary emissions of concern at the landfill. Potential TSP, PM_{10}, and $PM_{2.5}$ emissions from vehicle exhaust and break and tire wear for the on-Site vehicles was concluded to be insignificant based on results from previous assessments and were not included in this assessment.

Other tailpipe/combustion emissions, such as nitrogen oxides (NO_x) and carbon monoxide (CO), can also be concluded to be insignificant based on the small volume of daily traffic at the landfill, and the significant distances to sensitive receptors. The potential concentrations of NOx and CO that a person might be expected to be exposed to near a municipal road will far exceed the concentrations of these compounds at the landfill boundary. Therefore, it may be concluded that NO_x and CO emissions from the vehicles at the landfill continue to be insignificant contributors to the background concentrations of these compounds as the traffic volumes have remained the same.

Landfill gases, such as hydrogen sulfide (H2S) and vinyl chloride, can also be concluded to be insignificant based on the operations at the landfill. GHD completed a theoretical landfill gas generation rate for the Site. Based on the existing and proposed waste to be disposed at the Site, it is estimated that the maximum amount of landfill gas that will be generated is less than approximately 175 cubic feet (ft^3)/minute (in 2025). This will be distributed over an area of approximately 7.09 ha or 70,900 m^2, resulting in a landfill gas exit velocity of only 0.00007 m/second. This amount of landfill gas generation is anticipated to be insignificant from an overall Site profile and therefore landfill gases are not included in any further assessment.

Odours from the operations have not been further assessed. Due to the nature of the material being landfilled and the previous assessment that evaluated the proposed conditions there is no change in the odour profile for the Site.

3.4.4.4 MECP Air Monitoring Data

The MECP has ambient air monitoring stations across Ontario that measure a variety of pollutant concentrations. Typically, the stations monitor criteria air contaminants, such as nitrogen oxides, carbon monoxide, sulphur dioxide, and particulate matter, with the exception of some specialized monitors that measure speciated volatile organic compounds (VOCs) and Polycyclic Aromatic Hydrocarbons (PAH). There are no active monitoring stations within the Study Area, therefore, the monitor located in Hamilton (29102), Ontario was chosen as the closest monitor to the Site.

The Hamilton station monitors nitrogen oxides, ground-level ozone, and $PM_{2.5}$. The Hamilton station is located towards the north in Hamilton and is expected to be influenced by the industry within the City of Hamilton. The focus of this assessment is on the various size fractions of particulate matter. Although the Hamilton Station is not representative of the Site, the data from this location has been included for completeness. The focus of this assessment is on the TSP, PM_{10}, and $PM_{2.5}$. These fractions of particulate matter are the main containments that will be released at the Site.

Hourly readings and 24-hour average values are provided as part of the Hamilton air monitoring data set for $PM_{2.5}$. The Hamilton monitor is located in a predominantly urban area. Therefore, the $PM_{2.5}$ concentrations around the Site are expected to be much lower compared to the monitoring station.

As shown in **Table 3.3**, the concentration for $PM_{2.5}$ for the 24-hour averaging period is below its respective Canada Ambient Air Quality Standard (CAAQS). The Annual average of the monitoring data indicates $PM_{2.5}$ levels are slowly increasing over time. However, this is a result of an increase in industry in the vicinity of the Hamilton monitoring station and is not expected to be the trend for the Site and its surrounding area. Based on the monitored data, the $PM_{2.5}$ background concentrations in the vicinity of the Site are expected to be well below the CAAQS. It is expected that the levels at the Site are significantly lower as they are not influenced by the industrial and populated areas of Hamilton.

As part of BRE's continuing commitment to ensuring that particulate matter emissions from the Site are minimized from amended operations the standard operating procedure (SOP) will continue to be deployed. The purpose of the SOP is to ensure Best Management Practices (BPMs) are implemented at the Site to reduce the potential generation of particulate matter results. This includes, but is not limited to, the watering and sweeping of roads that equipment uses to travel the Site.

Table 3.3 $PM_{2.5}$ Concentration (µg/m³) reported from the Hamilton Monitoring Station (STN29102)

	Monitoring Period					
Averaging Time	**2019**	**2020**	**2021**	**Average**	**CAAQS**	**Statistical Form**
24 hour	22.0	22.4	27.5	23.9	27	The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations
Annual	9.1	10.1	10.7	10.0	8.8	The 3-year average of the annual average of the daily 24-hour average concentrations

3.4.4.5 Odour Quality

The Site has a functional leachate treatment facility to minimize the generation of odours at the Site. The most recent odour monitoring completed by GHD at the Site in 2022, also confirmed that the leachate treatment system has reduced the potential for odour impacts. Faint odours were detected throughout the Site during the most recent odour monitoring, however, no odour that would be attributed to the Site was detected at any off-Site monitoring locations.

In addition to the on-Site and off-Site odour monitoring that was completed by BRE, GHD completed a theoretical landfill gas generation rate for the Site. Based on the existing and proposed waste to be disposed at the Site, it was determined that the maximum amount of landfill gas that will be generated is less than 297 m^3/hours) [175 cubic feet per minute (cfm)] (in 2025). This will be distributed over an area of approximately 7.09 ha or 70,900 m^2, resulting in a landfill gas exit velocity of only 0.00007 m/second. This amount of landfill gas generation is anticipated to be insignificant from an overall odour Site profile.

As part of BRE's commitment to ensuring that odour complaints are minimized from the existing and proposed operations a SOP was developed. The purpose of the SOP is to include odour mitigation measures that would be implemented to ensure that odour complaints are investigated and the condition that resulted in the odour complaint is mitigated.

See **Appendix D** for a detailed Air Quality Assessment Report.

3.5 Noise Existing Conditions

3.5.1 Study Area

The Noise Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **SSA** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended

– **LSA** – the area within the vicinity of the Site extending approximately 1 km in all directions from the SSA boundaries

3.5.2 Methodology

3.5.2.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Noise Study Team to determine existing Noise conditions within the Study Areas. The following sources of secondary information were collected and reviewed:

- Historic Noise Complaints
- Current zoning plans, definitions and land use designations
- Field Observations and Investigations
- Local traffic data
- MECP technical guidelines and standards
- March 27, 2020 Amended ECA #A110302
- D&O Report Vertical Expansion – Rev. 1, Brooks Road Landfill Site, 2270386 Ontario Inc., Prepared by GHD, June 15, 2021
- Noise Assessment Report (AAR) and BMP Plan for the Brooks Road Landfill Site Vertical Capacity Expansion EA, Prepared by GHD, June 14, 2021

3.5.3 Process Undertaken

GHD has describe the processes and steps taken in chronological order as required to best describe the methodology used for this assessment.

3.5.3.1 Historic Noise Complaints

Brooks Road Landfill has not received any formal noise complaints for the previous operations on-Site after a review of all formal complaint records provided since September 2015 which is based on the records provided by BRE Site operators. During a recent open house event in June of 2022 one written comment from a local resident was received indicating that there was a concern with the noise from tracked vehicles.

3.5.3.2 Review of Zoning

The Comprehensive Zoning By-Law for Haldimand County identifies the Site as “MD – Disposal Industrial Zone,” which is suitable for a municipal sanitary landfill site. The surrounding land uses are zoned Agricultural use.

3.5.3.3 Site Review

Previous data collected during the 2021 Environmental Screening was reviewed. The SSA is rural in character and surrounded by agricultural fields. There are no existing industries within the Study Areas other than the Facility that may contribute to the background noise levels.

During the Vertical Capacity Expansion EA, a Site visit was conducted for the purpose of determining noise impact exposure off-Site. Off-Site residential dwelling locations were reviewed and the height of structures for noise impact exposure analysis was determined.

The nearest residential dwelling is approximately 232 m northwest of the existing property boundary. There are approximately 14 existing one-storey (1.5 m above grade) and two-storey (4.5 m above grade) residential dwellings within the LSA as identified on **Figure 3.15**.

3.5.4 Description of Noise Existing Conditions

3.5.4.1 Local Traffic Data

There are three roads located within the Study Areas including:

1. Townline Road – is a two-lane dirt rural road with minimal local traffic only
2. Brooks Road – is a two-lane road with minimal local traffic and primarily used by Brooks Road Landfill
3. Highway 3 – is a two-lane road with significant 24-hour road traffic

Traffic data was obtained from the local traffic authority and the Ministry of Transportation (MTO). Townline Road and Brooks Road experience low traffic volumes based on Site observations and also confirmed by the traffic authority. Highway 3 traffic volumes are elevated and subject of analysis.

MECP's Ontario Road Noise Analysis Method for Environment and Transportation (ORNAMENT) software is the approved road traffic model that is currently used in the province of Ontario to evaluate noise generated from road traffic. However, the model does not graphically generate contours and cannot be used to evaluate large areas and multiple road corridors simultaneously. ORNAMENT modeling predictions are also limited to noise predictions less than 500 m from the source and a minimum traffic volume of 40 vehicles per hour is required to evaluate an individual roadway.

Due to these model limitations, Computer Aided Noise Abatement Acoustical Modeling Software (CADNA A) was selected for the purposes of this Study as the preferred modeling software for analysis of road traffic generated background noise existing conditions. In addition, the CADNA A modeling software is better suited to handle multiple noise sources and can generate contour plots with imported base maps.

Annual Average Daily Traffic (AADT) values are the only reported data for less travelled roads, which presents a problem when estimating daytime and nighttime background noise levels as the values do not provide a distribution for the two time periods. GHD used recommendations for traffic breakdown for provincial highways and regional roads as outlined in the ORNAMENT guidance document to address this issue. The most current road traffic volumes were obtained from Haldimand County and the MTO. The following AADT values were available for road segments within the Study Area:

– Highway 3 (MTO, 2016) – 3,250 vehicles / day
– Brooks Road (Haldimand County, 2019) – 131 vehicles / day

The existing noise conditions within the Study Areas were quantified using the industry standard CADNA A software and the road traffic data provided by the regulatory authorities. The US Department of Transportation Federal Highway Administration Traffic Noise Model (TNM) calculation standard was used in CADNA A to quantify the noise levels.

Vehicular road traffic generates noise that consists of mechanical noise from the engine and brakes, friction noise created from wheel contacting the road surface, and aerodynamic wind noise. Traffic volume, speed, road composition, gradient and surface type will affect the overall traffic noise that can be generated. Proximity and line-of-sight to the road corridor are most consequential for quantifying the off-Site noise exposure conditions.

The model calculates the predicted equivalent sound level (Leq) respective of the defined daytime (7 a.m. to 11 p.m.) and nighttime (11 p.m. to 7 a.m.) periods.

Figure 3.16 and **Figure 3.17** present the road traffic sound level contours within the Study Areas for the daytime and nighttime periods, respectively.

3.5.4.2 Off-Site Haul Routes

Highway 54 to Highway 3 is primarily used to reach Brooks Road and the off-Site haul route will not change regardless of the capacity modification. Any potential traffic increase to support the proposed increased landfill capacity will be evaluated using the noise model based on the future road traffic data.

3.5.4.3 MECP Technical Guidelines and Standards

The Noise character of the Study Area was defined in accordance with the MECP guidelines NPC-300 “Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning,” October 2013.

As stated in the guideline:

A “Class 1 Area” means an area with an acoustical environment typical of a major population centre, where the background noise is dominated by the urban hum.

“Class 2 Area” means an area with an acoustical environment that has qualities representative of both Class 1 and Class 3 Areas, and in which a low ambient sound level, normally occurring only between 23:00 and 07:00 hours in Class 1 Areas, will typically be realized as early as 19:00 hours.

Other characteristics which may indicate the presence of a Class 2 Area include:

– Absence of urban hum between 19:00 and 23:00 hours
– Evening background sound level defined by natural environment and infrequent human activity
– No clearly audible sound from stationary sources other than from those under impact assessment

“Class 3 Area” means a rural area with an acoustical environment that is dominated by natural sounds having little or no road traffic, such as the following:

– A small community with less than 1,000 population
– Agricultural area
– A rural recreational area such as a cottage or a resort area
– A wilderness area

The urban sound level limits are 5 A-weighted decibels (dBA) greater in comparison to the rural limits to account for the elevated background sound level or the urban hum due to road traffic or adjacent industrial/commercial activities.

Landfill activities and on-Site operations are compared directly against a daytime one-hour Leq sound level limit of 55 dBA for landfill operations that are limited to 7 a.m. to 7 p.m. under the “Noise Guidelines for Landfill Sites” (N-1), October 1998.

3.5.5 2021 ECA and Existing Sensitive Receptors

The 2021 ECA amendment application that was prepared for the fill rate amendment confirmed that the Study Area immediately surrounding the Site is a mixed acoustical Class 2 and Class 3 area, depending on the proximity of the sensitive receiver to the adjacent road corridors and traffic volumes.

The Facility is located in a mixed acoustical Class 2 and Class 3 area, depending on the proximity of the sensitive receiver to the Highway 3 corridor. Acoustical Class 2 areas are defined by NPC-300 as an Noise environment with elevated daytime noise levels. Acoustical Class 3 areas are defined by NPC-300 as rural areas with an acoustical environment that is dominated by natural sounds having little or no road traffic.

The nine residential dwellings located along Highway 3 are considered to be Class 2 receivers and the five residential dwellings situated away from the corridor are considered to be Class 3 receivers. However, N-1 is the applicable regulatory Guideline for compliance assessment purposes for this Site and the proposed capacity increase.

The nearest residential dwelling is approximately 232 m from the property boundary.

3.5.5.1 Landfill Existing Conditions

Brooks Road Landfill is proposing to increase the total landfill capacity by 219,400 m^3 maintaining the current daily approved fill rate. With this increase in mind, the equipment currently utilized on-Site is expected to continue. Therefore, the significant environmental noise sources at the Landfill include the following is considered a maximum volume to allow for flexibility in Site operations:

- 2x Leachate Aerator in an Enclosure (24/7 steady state operation) (91.4 dBA)
- 3x Bulldozers (daytime operation only) (106.3 dBA)
- 2x Compactors (daytime operation only) (106.5 dBA)
- 1x Rock Truck (daytime operation only) (105 dBA)
- 2x Excavators (daytime operation only) (106.5 dBA)
- 2x Skid Steers (daytime operation only) (109.1 dBA)
- 1x Sheepsfoot Packer (daytime operation only) (106.5 dBA)

SSA haul route truck activities are summarized below:

Table 3.4 On Site Vehicle Volumes

Type of Vehicle	Day 7a.m.- 7 p.m. (Trips/hour)	Evening 7p.m.- 11 p.m. (Trips /hour)	Night 11 p.m.- 7 a.m. (Trips /hour)
On-Site Haul Route (Source TR2)	16	0	0

These noise sources generate continuous steady state mechanical noise and will be the subject of analysis for the evaluation. These noise sources are input into an industry standard Noise model that includes all significant Site structures (buildings, equipment, storage tanks and silos).

CADNA A, version 2023, is based on the ISO 9613-2 standard “Noises – Attenuation of Sound During Propagation Outdoors – Part 2: General Method of Calculation.” The CADNA A model is the industry standard for environmental noise modeling in Ontario.

The worst-case cumulative Site-wide sound levels estimated at the receptor(s) included attenuation effects due to geometric divergence, atmospheric attenuation, barriers/berms, ground absorption and directivity, as applicable significant noise sources at off-Site buildings were input into the model as intervening structures.

CADNA A modelling assumptions applied include the following:

- **Noise Sources** | All sources were modelled using the 1/1 octave band data from manufacturer’s sound level data or reference materials
- **Noise Source Elevation** | The heights of the noise sources were modelled at the tallest point to represent the worst-case line of sight and emission of noise
- **Ground Absorption** | The model included water (G=0), soft/porous ground (G=1), and gravel/hard ground (G=0.25)
- **Receptor Elevation** | POR receptor heights were modelled appropriately to represent the worst-case elevation based on one or two-storey residences at the worst-case compass directions from the Site as no houses are present
- **Time-weighted Adjustment** | Time-weighted adjustments for sources that do not operate continuously were utilized
- **Tonality** | A +5 dBA adjustment was applied for tonal sources if applicable
- **Foliage** | Foliage attenuation was not considered in our analysis as a conservative assumption

Table 3.5 Noise Modelling Parameters

Item	Model Parameters	Model Setting
1	Temperature	10°C
2	Relative humidity	70%
3	Wind speed	Downwind condition; wind speed of 3 m/s
4	Max. Search Radius (m)	2500 m
5	Noise propagation model	CADNA A (DataKustik 2023)
6	Standard	ISO 9613
7	Terrain parameters	Flat topography was assumed
8	Reflection parameters	2 orders of reflection

In order to predict the future worst-case noise impacts from the Project activities, representative octave band noise data was used, measured from construction/processing equipment similar to what is noted to be required for the Project. This data was obtained from the United Kingdom's Department of Environment Food and Rural Affairs (DEFRA) Update of Noise Database for Prediction of Noise on Construction and Open Sites, 2005 and 2006 (common source used globally). The United States Department of Transportation, Federal Highway Administration (FHWA) document FHWA Roadway Construction Noise Model User's Guide, 2006 was used as a supplemental document to obtain sound level data for equipment not listed by DEFRA.

The existing Landfill noise contours are presented on **Figure 3.17**. The noise impacts predicted at the 14 residential dwellings are below the 55 dBA noise limit (blue contour plot) defined in Guideline N-1. The future off-Site environmental noise impact from the Brooks Road Landfill Facility will be modelled using this industry standard acoustical model methodology to evaluate the capacity modifications in terms of the net effects.

3.6 Natural Environment

3.6.1 Study Area

The Natural Environment Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **SSA** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– **LSA** – all lands and waters within a 1 km radius of the SSA boundaries

The lands surveyed within the LSA, surrounding the SSA, are referred to throughout this report as three areas: North Lands, East Lands, and West Lands.

The area to the south and east of the SSA (herein referred to as “East Lands”) consists of undeveloped rural property consisting of a combination of agricultural fields and forested lands. On the west side of Brooks Road (herein referred to as “West Lands”) is a rural property which is characterized by agricultural fields and small forested plots. To the north of the SSA, there is a rural property consisting of limited agricultural fields and forested lands.

3.6.2 Methodology

3.6.2.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Natural Environment Study Team to determine existing Natural Environment conditions within the Study Areas. The sources reviewed are outlined in **Table 3.6.**

Table 3.6 Secondary Source Information Reviewed

Source	Information Reviewed
Ministry of Northern Development, Mines, Natural Resources and Forestry (MNDMNRF)	– Species at Risk (SAR) – Natural Heritage Features data layers from Land Information Ontario – Aquatic Resource Area (ARA) Survey Points
MECP	– SAR in Ontario
Fisheries and Oceans Canada (DFO)	– 2022 SAR fish, mussel, and critical habitat maps for the Study Areas
GRCA	– Fisheries Management Plan (2001) – Wetlands map layer
Niagara Peninsula Conservation Authority (NPCA)	– Wetlands map layer
GHD	– Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment (February 2017)
CRA	– Scoped Environmental Impact Study Former Railway Corridor Lands North of Brooks Road Landfill, Haldimand County, ON (December 2013)
Ontario Breeding Bird Atlas (OBBA)	– Breeding bird data for the Study Areas
Ontario Butterfly Atlas (OBA)	– Species records for the Study Areas
Ontario Reptile and Amphibian Atlas (ORAA)	– Species records for the Study Areas

3.6.2.2 Consultation

The Guelph District MNDMNRF, the MECP, the GRCA, and the NPCA were consulted on March 2, 2022, to request available natural heritage information, aquatic records, relevant wildlife records and SAR records. A response was received from MNDMNRF and NPCA on March 4, 2022, from GRCA on March 8, 2022, and from MECP on September 13, 2022. Additional information provided by the agencies was incorporated into this report. Agency correspondence is included in Appendix A of the Natural Environment Assessment Report (see **Appendix F**).

Although there was no direct consultation with the agencies during the preparation of this *Natural Environment Assessment Report*, the MNDMNRF, GRCA, and NPCA were consulted extensively during the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017). GRCA and NPCA also participated in a Site walk with GHD ecologists to confirm wetland boundaries in the North Lands on July 5, 2013. GRCA conducted an additional Site walk with GHD ecologists on June 12, 2014, to confirm the wetland boundaries of the East Lands.

A meeting was held with the Mississauga's of the Credit First Nation (MCFN) on July 19, 2022, and provided an opportunity for GHD to answer questions the MCFN had regarding the proposed capacity expansion of the Brooks Road Landfill.

3.6.2.3 Species at Risk Screening

Prior to conducting the field surveys, a screening of SAR with potential to be present within the Study Areas was completed. The term SAR is used to encompass species that are listed as Endangered (END), Threatened (THR), or Special Concern (SC) under the provincial *Endangered Species Act* (ESA; 2007) or under the federal *Species at Risk Act* (SARA; 2002). Only species listed as THR and END receive protection under the ESA. SC species may be protected under other policy instruments such as those for Significant Wildlife Habitat (OMNR 2000). With the exception of migratory birds protected by the *Migratory Bird Convention Act* (MBCA; 1994) and aquatic species, SARA generally does not apply on non-federal lands.

3.6.2.4 Field Investigations

GHD staff conducted various field investigations within the North and East Lands throughout 2020 to 2022 to identify natural environment habitats, and species and features present within the Study Areas (**Table 3.7**). Field surveys were conducted within the LSA that were directly adjacent to the SSA (up to 150 m radius or limited to the right-of-way of Brooks Road) to accurately characterize the neighbouring habitat and natural features present. No wildlife species surveys were conducted within the SSA due to active operation of the landfill and limited suitable habitat; however, incidental observations were collected at all field visits and are discussed in sections below.

Table 3.7 Field Investigations

Field Investigation	Dates
Ecological Land Classification and Vegetation Inventory	July 10, 2022 (East Lands) June 28, 2021 (North Lands)* June 29, 2020 (North Lands)*
Amphibian Surveys	April 12, May 11, and June 15, 2022 (North, East, and West Lands) March 25, April 13, and June 28, 2021 (North Lands)* May 28, 2020; June 29, 2020 (North Lands)*
Breeding Bird Surveys	June 10, June 27, and July 10, 2022 (East Lands)
Songmeter recording	June 13 to July 10, 2022 (North Lands)
Incidental Species Observations	Collected during all field visits
Notes	
* Completed as part of ECA monitoring of the North Lands which are provided here for a more fulsome characterization of the Study Areas (GHD 2021, 2022).	

Data collection focused on assessing vegetation and wildlife habitat characteristics within the Study Areas. Methodology for each field survey is provided below.

3.6.2.5 Aquatic Community Surveys

The MNDMNRF were consulted for aquatic community information. Aquatic community surveys were not completed during this round of Study Area investigations due to:

– The footprint of the SSA, from the natural environment perspective, is coincident with the existing property boundary
– Semi-aquatic species such as Blanding's turtle will be considered to have assumed presence (based on local records)
– Water discharged from Site is governed by an ECA that is not anticipated to change because of these activities

– Additional Site controls and mitigation measures at this property boundary which limit natural environment interactions with the Site and surrounding areas are employed following the recommendations of the recent Vertical Expansion EA

3.6.2.6 Ecological Land Classification and Botanical Inventory

Vegetation communities within the East Lands were mapped and described following the *First Approximation – ELC System for Southern Ontario* (Lee et al. 1998) and the *Southern Ontario ELC Scheme* (Draft; Lee et al. 2008). A botanical inventory (including a search for rare plant species) was completed for each ELC unit where access permitted within the LSA. The vegetation inventory was compiled and refined by incidental observations recorded throughout all field visits.

3.6.2.7 Wetland Boundaries

Wetland boundaries were delineated by GHD, GRCA, and NPCA in the North Lands on July 5, 2013. GHD and GRCA delineated the wetland boundaries in the East Lands on June 12, 2014. Wetland delineations of the Study Areas were prepared following Ontario Wetland Evaluation System (OWES) methods (MNR 1994; MNR 2013). 2022 ELC mapping confirmed those wetland boundaries delineated in 2013 and 2014.

Calling Amphibian Surveys

Calling amphibian surveys were conducted according to the Marsh Monitoring Protocol (BSC 2009) and were carried out at six stations within wetlands in the North, East, and West Lands. All surveys commenced a half hour after sunset and consisted of listening at each station for three minutes after two minutes of silence. During the survey, any frogs or toads heard calling were documented and a measure of 1, 2, or 3 for the abundance of each species within 50 m of the survey point, 50 – 100 m of the survey point, or greater than 100 m of the survey point was applied.

Breeding Bird Surveys

Breeding bird surveys were conducted on June 10, June 27, and July 10, 2022, within the East Lands. This was conducted during the breeding season when most birds are on their territories engaged in breeding activities. Surveys were conducted between 5:00 and 11:00 a.m. A point count methodology was utilized, where a point count location was surveyed for five minutes, and all species seen and heard were recorded. Breeding evidence was recorded to determine if the species was a possible, probable, or confirmed breeder following protocols of the Ontario Breeding Bird Atlas (Cadman et al. 2007). Locations of the Breeding Bird Survey (BBS) stations were identified in the *Terrestrial and Aquatic EA Report for the Brooks Road Landfill Site Vertical Capacity Expansion EA* (GHD 2017).

A songmeter (SM1) was also installed in the North Lands to collect audio recordings of breeding bird occurrences outside of the survey periods. The songmeter collected recordings for five minutes of every hour for three hours after sunrise and three hours after sunset during from June 13, 2022, until July 11, 2022. This captured breeding bird presence during the time of the day when vocal calling was highest for songbird species. Audio recordings were analyzed by avian ecologists to determine species presence.

3.6.2.8 Incidental Wildlife Observations

Observations and signs of wildlife were recorded, including browse, tracks, trails, scat, burrows, remains, nests, and vocalizations.

3.6.3 Description of Natural Environmental Existing Conditions

The LSA was dominated by agricultural lands under active row crops, forests, and wetlands. A photographic log is presented in Appendix B of the Natural Environment Assessment Report (See **Appendix F**).

3.6.3.1 Designated Areas

The LSA contains natural landscape features of provincial significance (see **Figure 3.19**).

The North Cayuga Slough Forest is an Area of Natural and Scientific Interest (ANSI), located in the northwest portion of the LSA and the Brooks Road/Townline Road intersection. This 1,214 ha landscape feature is composed of a diverse complex of woodlands, vernal pools and sloughs which are bordered by swamps (GRCA 1997). The sloughs are a result of the Beverly and Toledo silty clay plains and the Lincoln clay plains. Generally, the area is dominated by imperfectly to poorly drained lacustrine silty clay and heavy clay. The upland areas are dominated by sugar maple (*Acer saccharum*), white ash (*Fraxinus americana*) and red oak (*Quercus rubra*). Red maple (*A. rubrum*), swamp white oak (*Q. bicolour*) and black ash (*F. nigra*) typically dominate the low, wet basins. Field communities are characterized by hawthorns (*Crataegus spp.*), southern arrowwood (*Viburnum dentatum*) and narrow-leaved meadowsweet (*Spirea alba*), representing some of the many transitional environments between the distinct upland and low land areas. This area is of special importance due to its textbook clay-plain sediments and sand ridges which lead to the very distinct vegetation patterns. Previous studies have documented that 14 vegetation species and four bird species that are rare nationally, provincially and/or regionally occur in the area. This area is also home to a heronry (GRCA 1997). Of the 14 rare vegetation species, only two were observed in the LSA. These species are discussed further in section below.

The North Cayuga Swamp Wetland Complex is a PSW complex that is also present within the SSA and throughout the LSA in general (see **Figure 3.21**). This wetland complex is made up of numerous individual wetlands dominated by swamp with some marsh wetlands. The PSW extends to the northernmost portion of the SSA and incorporates the wetland elements of the North Cayuga Slough Forest. The complex vegetation community is characterized by thicket swamps of narrow-leaved meadowsweet, buttonbush (*Cephalanthus occidentalis*), winterberry (*Ilex vericillata*), or speckled alder (*Alnus incana ssp. rugosa*) with red maple, gray dogwood (*Cornus foemina ssp. racemosa)*, highbush blueberry (*Vaccinium corymbosum*), and willows (*Salix spp.*) as associates (NPCA 2010). The soil is a clay, loam, or silt composition.

Majority of the LSA is white-tailed deer (*Odocoileus virginianus*) wintering area as delineated by the MNDMNRF (**Figure 3.20**). Online mapping shows the majority of the SSA is also included in this delineation; however, given the SSA's fencing and lack of suitable habitat it is unlikely to be used by white-tailed deer for wintering.

3.6.3.2 Aquatic Communities

Consultation with the MNDMNRF identified Pike Creek as present within the LSA; approximately 500 m west of the SSA. Pike Creek has a warm thermal regime with the following species identified: black crappie (*Pomoxis nigromaculatus*), bluegill (*Lepomis macrochirus*), bluntnose minnow (*Pimephales notatus)*, brook stickleback (*Culaea inconstans*), brown bullhead (*Ameiurus nebulosus)*, central mudminnow (*Umbra limi)*, common shiner (Luxilus cornutus), creek chub (*Semotilus atromaculatus*), gizzard shad (*Dorosoma cepedianum*), golden shiner (*Notemigonus crysoleucas),* green sunfish (*Lepomis cyanellus)*, largemouth bass (*Micropterus salmoides*)**,** logperch (*Percina caprodes*), northern pike (*Esox Lucius*), pumpkinseed (*Lepomis gibbosus)*, rock bass (*Ambloplites rupestris*), sunfishes (*Centrarchidae spp.),* and white sucker (*Catostomus commersonii*). Pike Creek does not drain from or into the SSA, therefore was not subject to field investigations.

3.6.3.3 Vegetation Communities and Flora

3.6.3.3.1 Vegetation Communities

In June 2022, GHD conducted a vegetation inventory and Ecological Land Classification (ELC) of select areas within the LSA which included the East and North Lands. This inventory and classification builds upon field visits completed between 2013 and 2015 for the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017).

During the 2013 – 2015 EA surveys, a species of interest detected during field activities was pumpkin ash (*Fraxinus profunda*), which is ranked as S2 provincially and is a regionally rare species in the Haldimand-Norfolk County. It is found in swampy areas with standing water for most of the year. A single specimen in poor condition was found along the south base of the abandoned rail line to the east of the landfill property (within the LSA). During 2022 this species was not observed and was likely located outside the selected field areas surveyed.

Another species of interest that was detected in past field investigations conducted by others was black gum (*Nyssa sylvestre*). A small stand of black gum was found in the SSA by Natural Resource Solutions Inc. (NRSI) in 2004 at the southeast corner of the landfill prior to clearing activities. The stand of black gum was identified by GHD on the landfill property during 2016 field investigations (GHD 2017). The trees were found to be tagged and located in the direct vicinity of active landfilling activities, without any tree protection measures. Black gum is a provincially rare species (S3) in Ontario, but within Haldimand-Norfolk County black gum is considered common. Presence of these trees was not confirmed in 2022 surveys; however, wildlife exclusion fence installed around the on-Site wetlands in the southeast corner of the landfill restricts work in this area.

ELC mapping was prepared following Ecological Land Classification for Southern Ontario: A First Approximation (Lee et al. 1998) and is presented on **Figure 3.22**. To complete the classification, ELC-certified ecologists conducted field visits to assess the landform and parent material, soil, and vegetation present. Through assessment of these characteristics, classification of the ecological communities was completed for the North, East, and West Lands in 2016 by GHD. The balance of the LSA (up to a 1 km radius from the SSA) was assessed using aerial photography interpretation and knowledge of the area. Confirmation and update to any vegetation communities to the North and East Lands were completed during the summer of 2022. Thirty-nine ecological land classification community classes are represented within the LSA and include aquatic, swamp, marsh, meadow, thicket, forest, transportation and utilities, and cultural systems. The vegetation inventory is presented in Appendix C of the Natural Environment Assessment Report (see **Appendix F**).

3.6.3.3.1.1 ELC from 2022 Survey

Characteristics of each of the identified community types observed during the summer of 2022 are provided below. These communities are delineated in **Figure 3.22** as “Field Verified – 2022”.

Upland Communities

AG: Agriculture

Agricultural fields are present throughout the LSA and are actively farmed. At the time of survey, winter wheat (*Triticum aestivum*), corn (*Zea mays ssp. mays*), and soybean (*Glycine max*) crops were planted within the AG fields of the East and West Lands. Small wetland and drainage areas were present throughout the actively farmed agriculture fields.

CVI_1: Transportation

This area is composed of roadways, a decommissioned rail line from which rail ties have been removed, and an active rail line.

CVI_2: Disposal and Recycle

This is the Brooks Road Landfill Site, which is in active operation.

CVR_4: Rural Property

This is a rural property with residential and accessory structures.

CUL: Cultural

This classification is applied to the disturbed and actively managed areas of the clay stockpile. No vegetation is present.

FODM3-1: Dry-Fresh Poplar Deciduous Forest

The dry-fresh poplar deciduous forest is located along the edge of the existing waste disposal area. The topography is relatively flat with moist soil. Trembling aspen (*Populus tremuloides*) dominates the semi closed canopy of this community, with red maple, red oak (*Quercus rubra*), and various shrub species also present within the unit. The sub-canopy, understory and ground layer are dominated by typical upland species such as riverbank grape (*Vitis riparia*), buckthorn (*Rhamnus spp*.), dogwood (*Cornus spp.*), pasture rose (*Rosa carolina*), goldenrod, and bedstraw (*Galium sp*.).

FODM9: Fresh-Moist Oak- Maple-Hickory Deciduous Forest

This forest type is located west of Brooks Road and in close proximity to swamps and is a dense deciduous community composed of shagbark hickory (*Carya ovata*), red maple, sugar maple (*Acer saccharum*), balsam poplar (*Populous balsamifera*), silver maple (*Acer saccharinum*), red oak, white pine (*Pinus strobus*), American beech (*Fagus grandifolia*), ironwood (*Ostrya virginiana*), and swamp white oak (*Quercus bicolor*). Due to the large area of this unit, ground vegetation varied throughout the area and included sensitive fern (*Onoclea sensibilis*), bracken fern (*Pteridium aquilinum*), spotted jewelweed (*Impatiens capensis*), Canada mayapple (*Podophyllum peltatum*), highbush cranberry (*Viburnum trilobum*), garlic mustard (*Alliaria petiolata*), trout lily (*Erythronium americanum*), Canada thistle (*Cirsium arvense*), black raspberry (*Rubus occidentalis*), woodland strawberry (*Fragaria vesca*), and lesser burdock (*Arctium minus)*.

FODM9-4: Fresh-Moist Shagbark Hickory Deciduous Forest

This low forested area is adjacent to one of the slough wetlands and is dominated by shagbark hickory with ironwood, white ash, red oak, red maple, and swamp white oak being present. The soil in this area is moist with a rolling topography. The groundcover includes goldenrod species, trout lily, running strawberry bush (*Euonymus obovatus*), ostrich fern (*Matteuccia struthiopteris*), and other herbaceous species.

THD: Deciduous Thicket

A small pocket of deciduous thicket was observed north of the existing fence line and is dominated by a gray dogwood (*Cornus racemosa)* with patchy canopy coverage of white ash (*Fraxinus americana)*, elm (*Ulmus spp.*), hawthorn (*Crataegus ssp.*), and red maple (*Acer rubrum)*. The ground layer is dominated by timothy grass (*Phleum pratense*), common milkweed (*Asclepias syriaca*), goldenrod (*Solidago sp.*), Canada bluegrass (*Poa compressa*), common cinquefoil (*Potentilla simplex*), oxeye-daisy (*Leucanthemum vulgare*), deptford pink (*Dianthus armeria*), and woodland sedge (*Carex blanda*).

THDM2-4: Gray Dogwood Deciduous Shrub Thicket

This mid-age transitional community is present in multiple locations throughout the LSA and is typically associated with the drier edges of wetlands. The area is similar to the cultural thicket (CUT1) community but is characterized by a dominant shrub cover of gray dogwood. Other community species indicative of an upland environment includes white ash, hawthorn, and goldenrod.

THDM2-11: Hawthorn Deciduous Shrub Thicket

This flat area of mineral soil is located in close proximity to an agricultural field. Hawthorn species dominate this landscape. Very few trees are located within this thicket and other species present include gray dogwood, serviceberry (*Amelanchier sanguinea*), and white pine.

THM: Mixed Thicket

Located to the east of the landfill property, this upland thicket is adjacent to two wetlands. A few large mature white pines have established, and hawthorn, gray dogwood, and European buckthorn are present within the sub canopy.

Wetland Communities

MAMM1: Graminoid Mineral Meadow Marsh

This unit has a broad range of vegetation composition in the shrub and ground vegetation layers. Within the wetland, narrow-leaved cattail (*Typha angustifolia*) and reed-canary grass (*Phalaris arundinacea var. arundinacea*) dominates. Vegetation along the edge of this unit includes common teasel (*Dipsacus fullonum)*, common chicory (*Cichorium intybus)*, red clover (*Trifolium pratense*), cow parsnip (*Heraleum maximum*), goldenrod, bird's-foot trefoil (*Lotus tenuis)*, serviceberry, gray dogwood, reed-canary grass, and oxeye daisy.

MAMM1-3: Reed–canary Grass Graminoid Mineral Meadow Marsh

Located directly to the east of Brooks Road and on the south-west corner of the landfill property, this marsh is dominated by reed-canary grass and very little other vegetation except for a small pocket of narrow-leaved cattail located within a ditch.

MAMM2-5: Purple Loosestrife Forb Mineral Meadow Marsh

Purple loosestrife (*Lythrum salicaria*), large-fruited bur-reed (*Sparganium eurycarpum*), buttonbush (*Cephalanthis occidentalis*), and wool grass (*Scirpus cyperinus*) create a dense understory in this community. This community provides a transition between the bur-reed mineral shallow marsh and a meadowsweet mineral deciduous thicket swamp (SWTM5-7) present in the LSA, north of the SSA.

MAMM3: Mixed Mineral Meadow Marsh

This marsh is located directly beside an agriculture field and receives surface water flow from the surrounding agricultural area due to its low elevation. Graminoid and forb species dominate, and the composition includes European reed grass (*Phragmites australis ssp. Australis)*, goldenrod, bird's-foot trefoil, common teasel, reed-canary grass, Queen Anne's lace (*Daucus carota*, and purple loosestrife. Narrow-leaved cattail, narrow-leaved meadowsweet (*Spiraea alba),* awl fruited sedge (*Carex stipata*), fowl mannagrass (*Glyceria striata),* broadleaf arrowhead (*Sagittaria latifolia*), duckweed (*Lemna minor*), and large-fruited bur-reed are also present within the understory layer.

MASO1-1: Cattail Organic Shallow Marsh

The cattail organic shallow marsh is a small community located at the base of the old rail line to the east of the landfill property. The marsh is comprised of organic soils and is dominated by narrow-leaved cattail. The other vegetation consisted of bog hemp (*Boehmeria cylindrica*), greater pond sedge (*Carex riparia*), and spotted jewelweed. This wetland is attached by a small channel which flows south to another wetland (MASO3).

MASO3: Mixed Organic Shallow Marsh

The mixed organic shallow marsh is comprised of organic soils and surface water with maximum depths over 0.5m in some areas. The vegetation community consists of phragmites (*Phragmites australis var. australis*), duckweed, water-plantain (*Alisma spp.*), and enchanter's nightshade (*Circaea canadensis ssp. canadensis*). Willow trees (*Salix spp.*) and shrubs are present throughout the wetland.

SWDM4: Mineral Deciduous Swamp

The mineral deciduous swamp is located within a forest community near agricultural fields. Aerial photographic interpretation was used to determine this habitat. Based on this interpretation, it is expected that this swamp is comprised of mineral soils and many deciduous tree species. Field investigations found red maple, trembling aspen, and balsam poplar. Gray dogwood was observed in the shrub layer, as well as sensitive fern and mosquito bulrush (*Scirpus hattorianus*). The ground layer was comprised of celery buttercup (*Ranunculus sceleratus*), red raspberry (*Rubus idaeus*), fowl mannagrass, and riverbank grape.

SWDM4-5: Poplar Mineral Deciduous Swamp

This habitat is found in multiple locations across the property, typically along the edge of the existing waste disposal facility. It is characterized as a transition between wetland and forest habitats. The majority of the canopy is located along the edge of the existing waste disposal property and is dominated by trembling aspen. Red maple, blue spruce (*Picea pungens)*, sugar maple, pin oak (*Quercus palustris*), white ash, and red oak all compose the tree canopy. Many shrub species, including red osier dogwood, hawthorn, and nannyberry (*Viburnum lentago*), are present within this unit. Spotted jewelweed, sensitive fern, narrow-leaved meadowsweet, reed-canary grass, yarrow (*Achillea millefolium*), white sweet clover (*Melilotus albus*), water-plantain, shallow sedge (*Carex lurida*), and common cinquefoil composes the dominant ground vegetation. Standing surface water and buttressed roots are present within the unit.

SWTM2-3: Gray Dogwood Mineral Deciduous Thicket Swamp

The gray dogwood mineral deciduous thicket swamp represents a mid-age transition community between the similarly characterized meadowsweet mineral deciduous thicket swamp (SWTM5-7*)* and the large mixed mineral meadow marsh (MAMM3). It is characterized by a robust sub-canopy dominated by gray dogwood. Specimens of red maple, speckled alder (*Alnus incana*), and common alder (*Alnus glutinosa*) form the canopy layer. The other species constituting the vegetation community are meadowsweet, sensitive fern, reed-canary grass, spotted jewelweed, boneset (*Eupatorium perfoliatum*), pussy willow (*Salix discolor*), and bottle brush sedge (*Carex hystericina*).

SWTM5: Mineral Deciduous Thicket Swamp

The mineral deciduous thicket swamp is present at multiple locations and is composed of primarily shrub species. Aerial photographic interpretation was used to determine this habitat in multiple areas but a field verified unit exits to the east of the landfill property. Species including gray dogwood, serviceberry, red osier dogwood, and hawthorn species are present within this unit. Ground vegetation includes narrow-leaved meadowsweet, sedge, rush, grass, and forb species. Small pockets of narrow-leaved cattail and reed-canary grass are also present.

SWTM5-1: Buttonbush Mineral Deciduous Thicket Swamp

The buttonbush mineral deciduous thicket swamp is surrounded by a large meadowsweet mineral deciduous thicket swamp (SWTM5-7). This community is comprised of thick sub-canopy of buttonbush and willow species. Bladderwort (*Utricularia vulgaris*), cypress-like sedge (*Carex pseudocyperus*), meadowsweet, swamp white oak, rye grass (*Lolium perenne*), soft-stemmed rush (*Juncus effusus*), and blue vervain (*Verbena hastata*) were also present.

SWTM5-7: Meadowsweet Mineral Deciduous Thicket Swamp

The meadowsweet mineral deciduous thicket swamp is characterized by a robust understory composed of obligate and facultative wetland species such as narrow-leaved meadowsweet, gray dogwood, and purple loosestrife. Ground cover includes moss and fowl meadow grass (*Poa palustris*). The silty clay soil lacked horizons, but mottles were observed within the top 10 centimetres (cm) of the surface.

SWTO4-2: Gray Dogwood Organic Deciduous Thicket Swamp

The gray dogwood organic deciduous thicket swamp is a mid-age community present and is typically associated with wet low-lying habitat. The swamp is characterized by organic soils, deciduous community vegetation, and is driven by a dominant shrub cover of gray dogwood with a various species including sensitive fern, lily of the valley (*Convallaria majalis*), false solomon's seal (*Maianthemum racemosum ssp. racemosum)*, and narrow-leaved meadowsweet, all of which are indicative of a wetland environment.

3.6.3.3.1.2 ELC from 2016 Survey

Characteristics of each of the identified community types previously reported in the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017) is provided below. These communities are delineated in **Figure 3.21** outside of the "Field Verified – 2022" hatching.

Upland

MEGM4: Fresh Moist Graminoid Meadow

The fresh moist graminoid meadow is mainly characterized by mineral soil and low growing grass species. Garlic mustard, cow vetch (*Vicia cracca*), goldenrod, blueberry (*Vaccinium sp*.), Bebb's sedge (*Carex bebbi*), reed-canary grass, common teasel, lesser burdock, large-fruited bur-reed, wood sorrel (*Oxalis acetosella*), and other sedge, forb, and grass species are present within this meadow. Serviceberry, hawthorn (*Crataegus spp*.), and European buckthorn present along its periphery. A very small stream also runs through this unit.

MEMM4: Fresh-Moist Mixed Meadow

The fresh-moist mixed meadow is located in an upland area surrounding a pond excavated for agricultural use. The area has disturbed soils and is primarily composed of forb and graminoid species such as reed-canary grass, common milkweed, bird's-foot trefoil, Queen Anne's lace, asters (*Aster spp*.), and common chicory. No trees or shrubs are present.

FODM9-1: Fresh- Moist Oak – Sugar Maple Deciduous Forest

This upland forest interior landscape is surrounded by slough wetlands. Sugar maple, red maple, shagbark hickory, ironwood and swamp white oak compose the canopy of this forest. The understory is composed of fern species (Polypodiidae spp.*),* trout lily, mayapple, garlic mustard, spotted jewelweed, and Canada thistle.

FOMM1-2: Fresh-Moist White Pine-Hardwood Mixed Forest

This raised elevation area compared to the surrounding supports both coniferous and deciduous tree species and associated vegetation. The mineral soil is well drained and mature white pine, sugar maple, and white ash are present within this unit. Trout lily, mayapple, garlic mustard, and Canada thistle are also present.

TAGM1: Fine Mineral Coniferous Plantation

The fine mineral coniferous plantation is a mid-age treed community that reflects the surroundings and historic land use as a tree farm. The canopy is composed exclusively of blue spruce. The dominance within the sub-canopy is roughly divided between blue spruce and gray dogwood. Additional upland species include common teasel, goldenrod species, orchard grass (*Dactylis glomerata)*, broadleaf plantain (*Plantago major)* and common cinquefoil in the understory and as ground cover.

THDM3: Dry-Fresh Deciduous Hedgerow Thicket

This area is located south of the SSA and is situated along a rail bed. It is surrounded by marsh and agricultural fields. It has a raised topography compared to the surrounding landscape and is comprised of hawthorn species, common apple (*Malus pumila*), European buckthorn, amongst others.

Wetland

MAMO1: Graminoid Organic Shallow Marsh

The graminoid organic shallow marsh comprises a small wetland area located adjacent to an agricultural field and on the edge of a forest habitat. Vegetation includes primarily emergent sedge and graminoid species with small willow shrubs located on the periphery of the wetland.

MASO1: Graminoid Organic Shallow Marsh

The graminoid organic shallow marsh is a large wetland area dominated by tall robust vegetation. Standing water was present during multiple field surveys. Species composition is dominated by reed-canary grass, broad leaved water plantain (*Alisma subcordatum*), duckweed, pondweed (*Potamogeton sp.*), Queen Anne's lace, purple loosestrife, and vetch species (*Vicia spp.*).

SWDO3: Organic Deciduous Swamp

Sloughs with deep organic soils are present in most areas of the maple organic deciduous swamp unit. The canopy layer is dominated by red maple, American beech, shagbark hickory, and sugar maple. Small sporadic open water habitats are present, and many wetland sedges, ferns, and aquatic species are present. These include sensitive fern, bracken fern, spotted jewelweed, duckweed, false solomon's seal, narrow-leaved meadowsweet, etc.

SWD: Deciduous Swamp

This swamp is a diverse community comprised of many small tree stands containing deciduous tree species including red maple, shagbark hickory, trembling aspen, ironwood, hawthorn species, and burr oak (*Quercus macrocarpa*). Shrub species include gray dogwood, red osier dogwood, and serviceberry, among others.

SWT: Thicket Swamp

This swamp is a diverse community with small tree stands. It contains small patches of deciduous trees including trembling aspen, red maple, American beech, and ironwood. Shrub species dominate the landscape and include gray dogwood, red osier dogwood, and serviceberry, among others.

SWT02: Willow Organic Deciduous Thicket Swamp

The willow organic deciduous thicket shrub wetland is a small wetland with organic soil and an open water feature surrounded by willow tree and shrub species. This wetland overflows across a farmed field into a marsh wetland during the wet season. Other vegetation includes serviceberry, gray dogwood, duckweed, and graminoid species.

OAW: Open Water

Small open water habitats are present within the LSA, located near agriculture fields. These open water habitats were historically created by farmers for irrigation of crops within the surrounding fields. These ponds are uniform in shape and have little aquatic vegetation present.

3.6.3.3.2 Flora

A total of 139 vascular plants were identified to species level during field investigations, with one identified to genus (hawthorn [*Crataegus sp.*]). Of the species identified, 87 are native, 52 are non-native. 67 of the native species for which information is available have S-Ranks[22] of 'S5', indicating they are 'secure' in the province. Virginia creeper,

[22] Provincial (or Subnational) ranks are used by the Natural Heritage Information Centre (NHIC) to set protection priorities for rare species and natural communities. These ranks are not legal designations. Provincial ranks are assigned in a manner similar to that described for global ranks, but consider only those factors within the political boundaries of Ontario.

southern water-plantain, American reed, and Black walnut have an S-Rank of 'S4?' indicating they are 'apparently secure' in the province, however some uncertainty about the assigned rank exists. 10 species possess a ranking of S4 indicating that they are uncommon but not rare, with some cause for long-term concern due to declines or other factors.

81 of the native species for which information is available have co-efficient of conservatism[23] (CC) values of 0-6, indicating they are tolerant to moderately tolerant of disturbance. Six species possess a ranking of 7-9 which indicates that they have a low tolerance for disturbance.

No SAR plants were identified during the field investigation.

A list of vascular plant species identified during field investigations is provided in Appendix C of the Natural Environment Assessment Report (see **Appendix F**).

3.6.3.4 Herpetofauna

Herpetofauna encompasses all amphibians and reptiles. Calling amphibian monitoring was conducted and is further discussed below. Reptile-specific field surveys were not conducted during field investigations. However, the Ontario Reptile and Amphibian Atlas was reviewed, and incidental species observations were recorded at each field visit.

Herptile species identified in the Ontario Reptile and Amphibian Atlas as occurring within the Study Areas include:

– American bullfrog (Lithobates catesbeianus)
– American toad (Anaxyrus americanus)
– Blanding's turtle (Emydoidea blandingii)*
– Blue-spotted salamander (Ambystoma laterale)
– Dekay's brownsnake (Storeria dekayi)
– Eastern gartersnake (Thamnophis sirtalis sirtalis)
– Eastern Milksnake (Lampropeltis triangulum)
– Eastern red-backed salamander (Plethodon cinereus)
– Eastern ribbonsnake (Thamnophis sauritus)
– Gray treefrog (Hyla versicolor)
– Green frog (Lithobates clamitans)
– Midland painted turtle (Chrysemys picta marginata)
– Northern leopard frog (Lithobates pipiens)
– Northern map turtle (Graptemys geographica)
– Northern watersnake (Nerodia sipedon sipedon)
– Red-bellied snake (Storeria occipitomaculata)
– Red-spotted newt (Notophthalmus viridescens viridescens)
– Smooth greensnake (Opheodrys vernalis)
– Snapping turtle (Chelydra serpentine)
– Spotted salamander (Ambystoma maculatum)
– Spring peeper (Pseudacris crucifer)
– Western chorus frog (Pseudacris triseriata), Carolinian population
– Wood frog (Lithobates sylvaticus)

[23] Rank of 0 to 10 based on plant's degree of fidelity to a range of synecological parameters: (0-3) Taxa found in a variety of plant communities; (4-6) Taxa typically associated with a specific plant community but tolerate moderate disturbance; (7-8) Taxa associated with a plant community in an advanced successional stage that has undergone minor disturbance; (9-10) Taxa with a high fidelity to a narrow range of synecological parameters (Oldham et al., 1995).

Note: * denotes historical record (pre-2000)

American bullfrog, eastern gartersnake, eastern milksnake, green frog, northern leopard frog, northern watersnake, eastern red-backed salamander, and red-bellied snake were observed during 2020 – 2022 field investigations. Additional calling amphibians recorded in the LSA are detailed below. Blanding's turtle, snapping turtle, and Dekay's brownsnake were observed during 2013 – 2015 LSA field surveys (GHD 2017).

3.6.3.4.1 Calling Amphibian Surveys

Six calling amphibian stations were surveyed in the North, East, and West Lands according to the Great Lakes Marsh Monitoring Protocol (BSC 2009) in spring 2022 (**Figure 23**). All stations had detections of calling amphibians. Results of the calling amphibian surveys during 2020 – 2022 can be found in Appendix D of the Natural Environment Assessment Report (see **Appendix F**).

The composition of species detected during the amphibian surveys is representative of the amphibian population in the adjacent areas, where suitable habitat exists. Surveys in the North and East Lands confirmed the presence of American bullfrog, American toad, gray treefrog, green frog, northern leopard frog, spring peeper, and western chorus frog. Surveys in the West Lands confirmed the presence of the same species, with the exception of American bullfrog. In total, eight species of calling amphibians were documented in the LSA.

Each of the species recorded during 2020 – 2022 calling amphibian surveys had been previously documented in the vicinity as part of the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017). No species listed under the provincial ESA or the federal SARA were recorded during calling amphibian surveys.

3.6.3.5 Birds

Breeding bird surveys were conducted on June 10, June 27, and July 10, 2022, in the East Lands. A total of 61 species were detected during the surveys, 44 of which displayed evidence of breeding. A list of the species detected with evidence of breeding is provided in Appendix E of the Natural Environment Assessment Report (see **Appendix F**).

The SM1 recorder was deployed in the North Lands from June 10 – July 10, 2022, at the location identified on **Figure 3.23**. For consistency, the recordings were analyzed by the avian ecologist who completed the in-field breeding bird surveys. A list of all species detected by the SM1 is provided in **Appendix E** of the Natural Environment Assessment Report (see **Appendix F**)**.** The SM1 could only document presence of singing species and cannot provide visual observation of species.

In total, 71 species of birds were observed in the LSA and SSA during 2022 breeding bird surveys by GHD ecologists. Four of these species are SAR: barn swallow, eastern wood-pewee (*Contopus virens),* Canada warbler (*Cardellina canadensis*), and wood thrush (*Hylocichla mustelina*). Least bittern (*Ixobrychus exilis)* was heard vocalising within the East Lands in 2014 (GHD 2017). This species was not detected during the 2022 surveys within the LSA or SSA. Species at risk are discussed in greater detail in **Section 3.6.3.8**.

3.6.3.6 Mammals

Mammal-specific field surveys were not conducted as part of the project, but incidental observations were recorded. During field investigations big brown bat (*Eptesicus fuscus*), eastern cottontail (*Sylvilagus floridanus*), northern raccoon (*Procyon lotor*), red fox (*Vulpes vulpes*), striped skunk (*Mephitis mephitis*), white-tailed deer (*Odocoileus virginianus*), and unidentified bats were observed.

3.6.3.7 Incidental Wildlife Observations

Wildlife observations were collected during each field visit in addition to breeding bird and amphibian surveys. A list of incidental faunal species observations can be found in **Table 3.8**.

Table 3.8 Incidental wildlife observed within the Study Areas from 2020 to 2022

Species Observed		S-Rank	Conservation Status	
Common Name	Scientific Name		SARO	SARA
Amphibians				
American bullfrog	*Lithobates catesbeianus*	S4	N/A	N/A

3.6.3.8 Species at Risk

Numerous SAR have been observed within the Study Areas or have been flagged through agency correspondence or background review as having the potential occur within the Study Areas (**Table 3.9**). Incidental observations of all species, including any SAR encountered, were collected during field investigations and were detailed previously in **Table 3.8**. SAR species-specific surveys were not completed for a number of reasons including:

– Natural areas within the SSA are very small and limited to a small section of the southern boundary of the SSA. This area provides little available habitat for any of the listed SAR based on its proximity to the Site operations, small size, and presence of a chain link fence at the SSA boundary.
– Mitigation measures currently in place to dissuade wildlife access/use of the landfill property include:
  - Chain link fence is present around the perimeter of the property which dissuades larger reptile and mammal access to the SSA
  - Silt fence along the perimeter of the property is an effective deterrent for small reptiles, mammals, and amphibian access to the SSA
  - Daily landfilling activities (e.g., noise, human presence, heavy machinery) also provide deterrents for use of the SSA by wildlife

Operational practices (i.e., daily cover) further act to deter wildlife use of the SSA.

Table 3.9 Species at Risk Summary

Species		Observed within the Local Study Area	Conservation Status	
Common Name	**Scientific Name**		**SARO**	**SARA**
Birds				
Bank swallow	*Riparia riparia*	No	Threatened	Threatened
Barn swallow	*Hirundo rustica*	Yes*	Threatened	Threatened

American chestnut	*Castanea dentata*	No	Endangered	Endangered
Black ash	*Fraxinus nigra*	Yes^	Endangered	N/A
Butternut	*Juglans cinerea*	No	Endangered	Endangered
Eastern flowering dogwood	*Cornus florida*	No	Endangered	Endangered
Notes				
* Observed within the SSA ^ Observed within the LSA during 2013 – 2015 surveys (GHD 2017) SARO: Species at Risk in Ontario (provincial) SARA: Species at Risk Act (federal)				

Background review found 29 SAR which have historically been recorded in the Study Areas. Twenty-four species with a moderate or high likelihood of occurrence within the LSA are discussed further. The complete list of SAR and their potential to occur is provided in Appendix F of the Natural Environment Assessment Report (see **Appendix F**).

3.6.3.8.1 Endangered Species

Birds

Red-headed woodpecker (*Melanerpes erythrocephalus*) is a provincially and federally designated endangered species with a moderate likelihood of occurrence within the LSA due to suitable habitat being present.

Yellow-breasted chat (*Icteria virens virens*) is a provincially and federally endangered species and has a moderate likelihood of occurrence as suitable habitat is present within the LSA.

Mammals

Little brown myotis (*Myotis lucifugus*), tri-colored bat (*Perimyotis subflavus*), and northern myotis (*Myotis septentrionalis*) are all provincially and federally endangered species with a high likelihood of occurrence within the LSA due to the presence of suitable habitat (i.e., trees for roosting). Eastern small-footed myotis (*Myotis leibii*) is provincially endangered, not listed federally, and has a moderate likelihood of occurrence within the LSA due to suitable habitat (i.e., rocky areas for roosting) potentially being present.

Vascular Plants

American chestnut (*Castanea dentata*) is listed as endangered provincially and federally. This species has a moderate likelihood of occurrence as suitable habitat is present within the LSA; however, was not detected during any of the field investigations.

Black ash (*Fraxinus nigra*) is listed as endangered provincially and not listed federally. Protection under the ESA has been suspended until January 26, 2024, under O. Reg. 23/22 in order to document a proper approach and consultation with all parties. This species was observed by GHD in 2016 in the LSA and has a moderate likelihood of occurrence as suitable habitat is present; however, was not detected during any of the field investigations within the SSA.

Butternut (*Juglans cinerea) is a provincially and federally endangered species.* Butternut has a moderate likelihood of occurrence as suitable habitat is present within the LSA; however, was not detected during any of the field investigations.

Eastern flowering dogwood (*Cornus florida) is a provincially and federally endangered species.* Eastern flowering dogwood has a moderate likelihood of occurrence as suitable habitat is present within the LSA; however, was not detected during any of the field investigations.

3.6.3.8.2 Threatened Species

Birds

Bank swallow (*Riparia riparia*) is a provincially and federally threatened species. They have a moderate likelihood of occurrence as potentially suitable habitat is present within the LSA.

Barn swallow (*Hirundo rustica*) is a provincially and federally threatened species. Barn swallows were observed throughout the Study Areas on multiple occasions and have a high likelihood of occurrence within the Study Areas due to suitable foraging habitat.

Cerulean warbler (*Setophaga cerulea)* is a provincially threatened and federally endangered species with a moderate likelihood of occurrence within the LSA due to the presence of potentially suitable habitat.

Least bittern (*Ixobrychus exilis*) is a provincially and federally threatened species with a high likelihood of occurrence within the LSA due to the presence of suitable habitat. Least bittern was observed vocalising in the East Lands during 2014 surveys (GHD 2017).

Reptiles

Blanding's turtle (*Emydoidea blandingii*) is a provincially and federally threatened species. A Blanding's turtle was observed on Brooks Road in the vicinity of the entrance of the landfill, on June 12, 2014, during wetland delineation with GRCA (GHD 2017). This species has a high likelihood of occurrence within the LSA due to suitable habitat being present.

3.6.3.8.3 Special Concern Species

These species do not receive protection under the ESA or SARA; however, populations and habitats of ESA-listed special concern species may be considered Significant Wildlife Habitat. Impacts to these species should be avoided where possible by avoiding natural habitat features beyond the SSA.

Birds

Canada warbler (*Cardellina canadensis*) is a provincially designated special concern species, and a federally designated threatened species. Canada warbler was detected in the North Lands via the SM1 and has a high likelihood of occurrence within the LSA.

Eastern wood-pewee (*Contopus virens*) is a provincially and federally designated special concern species. Eastern wood-pewee was detected on multiple occurrences during the breeding bird surveys. This species has a high likelihood of occurrence due to suitable habitat being present within the LSA.

Wood thrush (*Hylocichla mustelina*) is a provincially designated special concern species, and a federally designated threatened species. Wood thrushes were detected on during the breeding bird surveys and SM1 audio recordings. They have a high likelihood of occurrence within the LSA due to suitable habitat being present.

Insects

Monarch (*Danaus plexippus*) is listed as special concern provincially and federally and was observed within the LSA. This species is considered to have a high likelihood of occurring as their larval foodplant, common milkweed, is present within the Study Areas.

Reptiles

Eastern ribbonsnake (*Thamnophis sauritus*) are a provincially and federally designated special concern species. *They* have a high likelihood of occurrence as suitable habitat is present within the LSA.

Midland painted turtle (*Chrysemys picta marginata*) is a federally designated special concern species and is currently under consideration for provincial designation. Midland painted turtles have a high likelihood of occurrence within the LSA as suitable habitat is present.

Eastern milksnake (*Lampropeltis triangulum*) is listed as not at risk provincially but is listed as special concern federally. Eastern milksnake was observed within the SSA and have a high likelihood of occurring within the LSA due to suitable habitat being present. Wildlife exclusion fencing has since been installed to limit the presence of wildlife within the SSA and is maintained as part of mitigation measures associated with the 2019 facility expansion (Notice of Approval EA File number 03-08-02 (Approval), issued in 2019 under the *Environmental Assessment Act*).

Northern map turtle (*Graptemys geographica)* is listed as special concern provincially and federally. This species has a high likelihood of occurring within the LSA due to suitable habitat being present.

Snapping turtle (*Chelydra serpentina)* is listed as special concern provincially and federally. A snapping turtle was observed within the LSA during 2013 field investigations (GHD 2017) and has a high likelihood of occurring within the LSA due to suitable habitat being present.

3.7 Cultural Heritage Environment

Cultural Heritage resources include archeological resources, built heritage resources, and cultural heritage landscapes.

3.7.1 Study Area

The Cultural Heritage Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **SSA**: Including all lands (i.e., 14.3 ha) within the existing, approved boundaries of the Site
– **LSA**: Including all lands and waters within a 1 km radius of the SSA boundaries including agricultural, residential, and municipal properties

3.7.2 Methodology

Available secondary sources of information were collected and reviewed to determine Heritage and Culture existing conditions within the LSA. The following sources of secondary information were collected and reviewed:

– Heritage Haldimand Designated Properties Inventory

3.7.3 Existing Conditions

3.7.3.1 Archaeological Resources

The screening checklist, Criteria for Evaluating Archeological Potential, developed by the Ministry of Citizenship and Multiculturalism, was completed as part of the Environmental Screening Report (see **Appendix G1**) determining that archeological potential within the study area is low and therefore archeological assessment was not undertaken.

3.7.3.2 Built Heritage Resources and Cultural Heritage Landscapes

Following a review of the Heritage Haldimand Designated Properties Inventory[24] it was concluded that there are no heritage properties located within the LSA. The “Criteria for Evaluating Potential for Built Heritage Resources and

[24] Heritage Haldimand, 2015. Heritage Haldimand Designated Properties. Available at: http://www.haldimandcounty.on.ca/residents.aspx?id=68

Cultural Heritage Landscapes: A Checklist for the Non-Specialist" (see **Appendix G2**) was completed and identifies the Site is within the Grand River watershed, which is a designated Canadian Heritage River watershed. There are no known heritage attributes located within the LSA. The Site has been subjected to extensive and intensive disturbance and is therefore considered to not have any potential for cultural heritage resources.

3.8 Transportation Existing Conditions

3.8.1 Study Area

The Transportation Study Areas to be discussed in relation to the preparation of this ESR are as follows:

– **SSA** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– **LSA** – the area within the vicinity of the Site extending approximately 1 km in all directions from the SSA boundaries

3.8.2 Methodology

3.8.2.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Transportation Study Team to determine existing Transportation conditions within the Study Areas. The following sources of secondary information were collected and reviewed in completing the 2018 Individual Environmental Assessment:

– Haldimand County Annual Average Daily Traffic (AADT) data, 2005
– Haldimand County Annual AADT data, 2011

3.8.2.2 Process Undertaken

Information on the Transportation Existing Conditions within the Study Areas was gathered from a combination of secondary source research, field investigations and discussions with Haldimand County staff.

3.8.2.3 Field Investigations

As part of the 2018 Individual Environmental Assessment, turning movement counts were conducted at the intersection of Highway 3 and Brooks Road and at the existing Brooks Road Landfill Site driveway during the weekday a.m., mid-day and p.m. peak periods and Saturday mid-day peak periods. These counts were completed on Saturday, December 5, 2015 and on Monday, December 7, 2015.

3.8.2.4 Agency Consultation

Also, as part of the 2018 Individual Environmental Assessment, discussions with Haldimand County staff took place in December 2015 to confirm AADT data.

3.8.3 Description of Traffic Existing Conditions

3.8.3.1 Road Network

The following two major roads provide access to the existing Brooks Landfill:

Highway 3 (Talbot Road) – within the vicinity of Brooks Road, Highway 3 (Talbot Road) is a two-lane road with a posted speed limit of 80 km/hour (kph). The intersection of Highway 3 and Brooks Road is stop controlled on Brooks Road with both eastbound and westbound right turn taper on Highway 3.

Brooks Road – Brooks Road is a two-lane road that extends from Highway 3(Talbot Road) in the south and terminates at Indiana Road to the north. The speed limit on this road is 50 kph. Brooks Road is paved from Highway 3 to just north of the Brooks landfill driveway access where it changes to a gravel road for the remaining length to Indiana Road.

3.8.3.2 Traffic Data

Historical AADT data was obtained from Haldimand County. The 2005 AADT on Brooks Road approximately 500 m north of Highway 3 was 144 two-way trips. In 2011 the AADT was slightly lower at 114 two-way trips. Discussions with staff confirmed that the split is approximately 50/50 between north and south volumes.

Turning movement counts were also conducted on Saturday, December 5, 2015 and on Monday, December 7, 2015 at both the intersection of Highway 3 and Brooks Road and at the existing Brooks Road Landfill Site driveway during the weekday a.m., mid-day and p.m. peak periods and Saturday mid-day peak periods. Detailed turning movement data sheets are found in Appendix A for the Transportation Assessment Report (see **Appendix H**).

3.8.3.3 2022 Base Traffic Conditions

To establish the base 2022 traffic conditions and capture any expected background growth in traffic volumes at the study area intersections, a conservative compound annual growth rate of 2.0% was adopted and utilized to forecast grow the 2015 turning movement counts to 2022. The base 2022 traffic volumes also includes the estimated 16 Site trucks per day as a result of the proposed vertical expansion approved in 2018. To provide a conservative and worst-case scenario analysis, all 16 of the daily truck trips associated with the vertical expansion were applied to each peak hour (i.e., all 16 will enter/exit the Site within each of the peak hours which results in a large over estimation of the daily traffic volumes to the Site).

The resulting 2022 weekday a.m., mid-day and p.m. peak hour as well as the Saturday peak hour volumes are summarized in **Figure 3.25**.

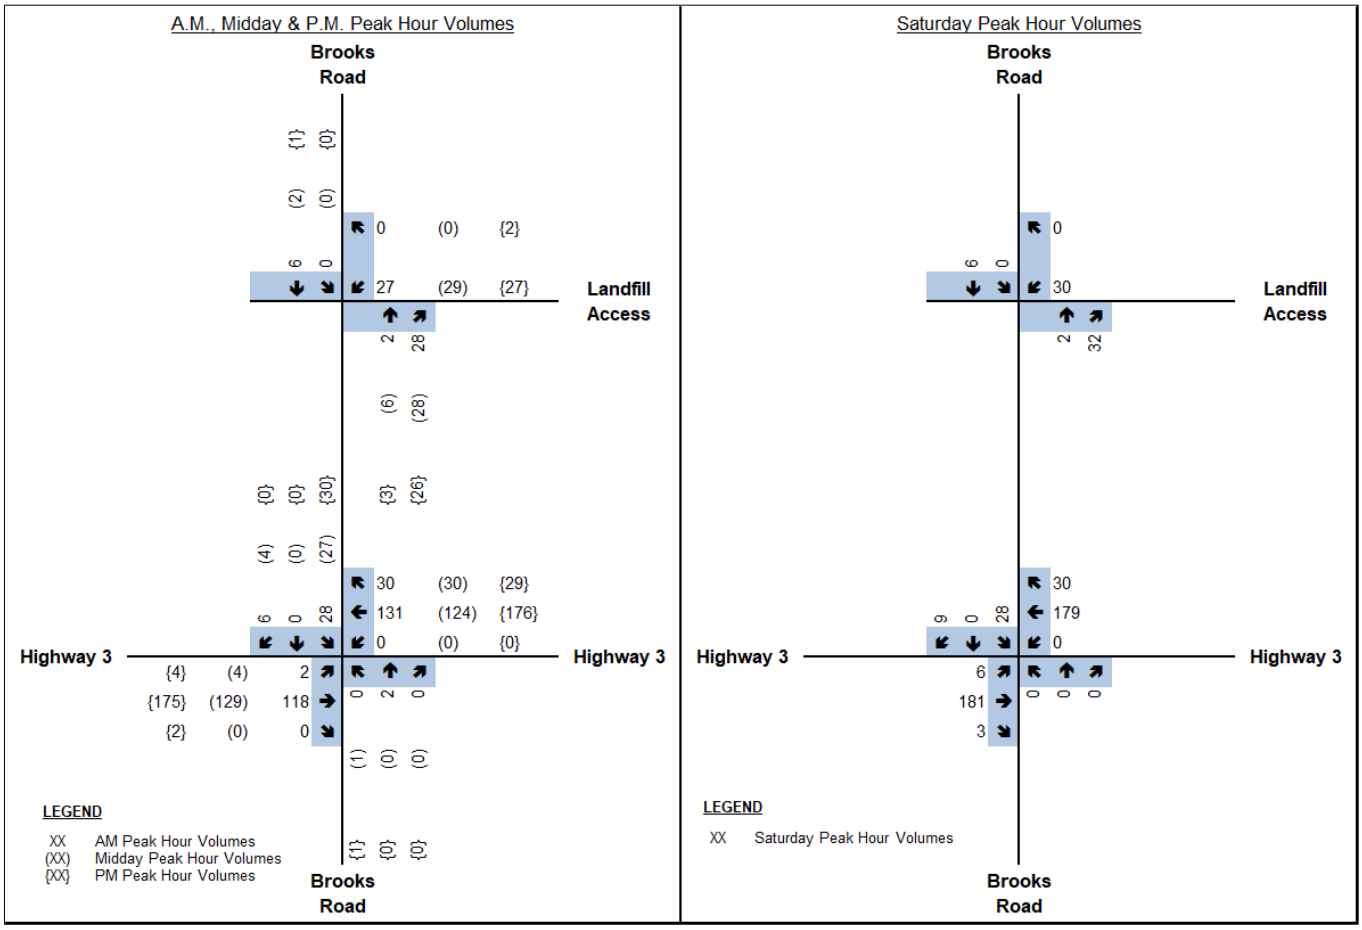

Figure 3.25 2022 Existing Peak Hour Volumes

Traffic on Brooks Road is predominately truck traffic specific to the landfill operation, traffic on Highway 3 is a mix of both commuter and truck traffic.

3.8.3.4 Landfill Operations

The Brooks Road Landfill Site is currently open and accepting waste during the week and on Saturdays. The Site currently handles 1,000 tonnes of material per day based on the following five different truck configurations:

– Walking floor – can handle 25 to 40 metric tonnes per load
– Roll-off – can handle 0.5 to 10 metric tonnes per load
– Front End – can handle 3 to 12 metric tonnes per load

– Tri-axle – can handle 14 to 22 metric tonnes per load
– Dump trailer – can handle 34 to 42 metric tonnes per load

The current maximum daily truck traffic at the landfill assuming delivery of 1,000 tonnes of material per day is 16 to 24 walking floor trucks, 2 to 4 front end trucks and 2 to 6 roll-offs for a total of 34 inbound and 34 outbound trucks plus another one or two trips for staff over the period of a day. This number can increase slightly if there are certain soil jobs on the Site as the walking floor trucks are replaced with Dump trailers and Tri-axle trucks.

The turning movement counts conducted at the Site driveway on Saturday December 5, 2015 and Monday December 7, 2015, show the following total volume of trucks entering and exiting the landfill during the peak hours:

– Weekday am peak hour – 12 inbound and 11 outbound
– Weekday mid-day peak hour – 12 inbound and 13 outbound
– Weekday pm peak hour – 10 inbound and 13 outbound
– Saturday mid-day peak hour – 16 inbound and 14 outbound

The traffic volumes confirm that the peak operating times for the landfill occur during both the weekday and Saturday mid-day peak hours when the maximum volumes of inbound and outbound traffic were observed.

Coincidentally, a review of the 2015 traffic counts confirms that the volume of inbound and outbound traffic from the landfill during the two survey dates was considerably higher than the typically expected volumes provided by the operator assuming delivery of 1,000 tonnes of material per day. It was confirmed that during the two survey dates, there was a transfer of clean clay to another property that resulted in approximately 75 additional loads throughout both days.

As a result, the analysis of the existing 2022 conditions not only includes the approved vertical expansion but also includes additional traffic that is not typical for existing operations and results in slightly reduced capacity at both the Site driveway on Brooks Road and at the intersection of Brooks Road and Highway 3.

3.8.3.5 Capacity Analysis

As a measure of the existing capacity on the adjacent road network surrounding the Brooks Landfill, both the Site access on Brooks Road and the stop-controlled intersection of Brooks Road and Highway 3 were analyzed using the projected 2022 turning movement volumes for the weekday am, mid-day, pm and Saturday peak hours (see **Table 3.10**). A summary of the capacity analysis using Synchro version 10 is summarized in the following table with detailed reports provided in Appendix A of the Transportation Assessment Report (**Appendix H**).

Table 3.10 Existing Capacity Analysis

Intersection	Movement v/c ratio (LOS) delay			
	A.M. Peak	Mid-Day Peak	P.M. Peak	Sat Peak
Brooks Road and Landfill access	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec
Brooks Road and Highway 3	EBTLR = 0 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS B 11 Sec SBTLR = 0.05 LOS B 10 Sec	EBTLR = 0 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS B 11 Sec SBTLR = 0.05 LOS B 11 Sec	EBTLR = 0 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS B 12 Sec SBTLR = 0.06 LOS B 12 Sec	EBTLR = 0.01 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS A 0 Sec SBTLR = 0.07 LOS B 12 Sec

The turning movements at both study intersections currently operate with levels of service 'B' or better during the weekday am, mid-day, pm and Saturday mid-day peak hours.

The analysis of existing conditions confirms no current capacity constraints at either study intersection despite the higher than normal traffic volumes captured during the survey of existing traffic volumes as a result of the movement of clean clay off-Site.

3.8.3.6 Safety Analysis

Collision Analysis

A review of available data shows that there is no indication that either Highway 3 in the vicinity of Brooks Road, or Brooks Road north to the Site has experienced significantly higher collision frequency than the historical average accident rate along Highway 3 in Haldimand County.

Sight Line Analysis

The Site entrance in its current location satisfies the sight distance requirements for trucks approaching and departing from the Site. Brooks Road is fairly straight with little deviation in the horizontal or vertical alignment. Existing sight distances are in excess of 350 metres both to the north and south of the driveway access which exceeds the required sight distance based on TACC standard of 85 m for stopping sight distance which for a posted speed limit of 50 kph (60 kph design speed).

4. Potential Environmental Effects, Mitigation Measures, and Net Environmental Effects

This section documents the potential effects on the environment, mitigation measures and net environmental effects for each technical disciplines resulting from the proposed landfill expansion. In addition, any future monitoring requirements to be implemented for each discipline are also described.

4.1 Methodology

A project description, based on the Design and Operation Report, was prepared so that potential environmental effects and mitigation measures could be identified. The Site Layout Plan is provided in **Figure 1.2** and the following is a general summary of the proposed undertaking.

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final Site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This will be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch will be required to accommodate the proposed changes to the final Site contours. The former railway property will continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in **Table 4.1**.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted north by 30 m. East and west ditches will extend north to maintain full perimeter ditch.
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Surface Water

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2.0** of this report.

The assessment of effects was achieved by conducting a hydrologic modelling of predicted effects of the landfill on surface water based on the proposed expansion scenario. The existing computer model PCSWMM 2012 Version 5.0.022 was updated to complete a hydrologic analysis to estimate changes in peak flows and runoff volumes from the Site under various storm event conditions for the proposed vertical expansion. Distinct design storm hyetographs were created in PCSWMM, based on the Environment Canada's Rainfall Intensity Duration Frequency

(IDF) Values for the Hamilton Airport. The 2, 5, 10, 25, 50, and 100-year 24- hour, SCS Type 2 distribution, storm events were considered in the hydrologic modelling to provide a design basis for on Site SWM features (quantity control).

The stormwater management system for the Site was designed to provide water quality and water quantity control of surface water runoff. Water quality treatment is provided through extended detention of the 4-hour duration 25 mm storm event. The SWM pond is designed to provide water quantity control for all storm events up to the 100-year storm, via attenuation of peak flows to below the Pre-Development Condition. Estimated runoff from the Regional Storm (Hurricane Hazel) has been assessed to demonstrate an ability to safely convey flow to downstream receivers.

At minimum, internal drainage ditches were sized to accommodate the peak flow generated from the 3-hour duration 25-year storm, as required by the MECP Guidelines.

The effects of the proposed landfill expansion on surface water is forecasted to be minimal based on the minor changes in contributing drainage areas in SSA.

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) for those Surface Water criteria which might be affected by the project as identified in **Section 2.0**. The effects assessment describes how existing environmental conditions in the Study Area(s) will change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2.0**, a “Yes” was applied to the following Surface Water criteria:

Might the Project:

– *Cause negative effects on surface water quality, quantities, or flow?*
– *Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?*

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.2.1 Surface Water Potential Effects

The proposed landfill expansion will result in changes to the existing landfill footprint, , final contours, and on-Site operations especially towards the northern side of the Site. These changes may cause negative effects on the following with respect to surface water:

– Surface water quality: minor erosion/soil loss due to slope transition from the proposed milder slope to the existing approved steep landfill slopes. Based on the Universal Soil Loss Equation (USLE), an increased slope will lead to increased soil loss due to erosion. The increase in soil loss will be minor as slope is only one of numerous factors that affect soil loss. The erosion will show up in stormwater runoff as slightly increased concentrations of Total Suspended Solids (TSS) and TSS related pollutants (e.g., metals entrained in the soil).
– Surface water quantity: similar runoff peak flows and volumes to existing landfill are expected. Based on hydrologic modelling completed in the SWM Plan report, there is no significant increase in runoff peak flow rates or volumes for the existing landfill slopes compared to the approved final closure conditions. Although the modelling was performed on the design for the existing condition, it is expected that the results for the proposed expansion will be similar.

The revised drainage areas are presented on **Figure 4.1** and a summary of the subcatchment parameters for contributing drainage areas to the SWM pond is presented in **Table 4.2** below:

Table 4.2 Proposed Subcatchment Parameters for Contributing Drainage Areas to SWM Pond

Catchment ID	Area (ha)	Slope (%)	Imperviousness Area (%)	Imperviousness Area (ha)	SCS Curve Number
201	3.06	25	5	0.15	73
202	1.48	25	7	0.10	74
203	1.23	25	5	0.06	72
204	3.05	25	8	0.24	73
206	0.14	2	5	0.01	72
207	0.38	2	95	0.36	98
208	0.26	2	95	0.25	98
209	0.21	2	5	0.01	72
210	0.43	10	100	0.43	98

4.2.2 Surface Water Mitigation Measures

Mitigation measures such as SWM controls are provided within the Site to convey surface runoff and provide sufficient water quality storage prior to discharge off-Site. These control measures will help to attenuate peak discharge for water quantity and meet the water quality requirement in accordance with the MECP Planning and Design Manual 2003 (SWMP Manual). Also, best management practices such as good vegetative coverage will be established on the final cover of the landfill to reduce erosion and maintain existing hydrologic conditions.

The existing stormwater controls within SSA include drainage ditches and the SWM pond which are summarized in subsequent sections.

4.2.2.1 Drainage Ditch

The existing drainage ditches on Site have a maximum depth of 1 m with side slopes of 4H:1V on landfill side and 3H:1V on the perimeter access roadside of the ditches. Surface runoff is conveyed from the final cover and access road to the SWM pond. The ditches were designed with sufficient capacity to convey flow in excess of that generated by the 100-year or Regional storm.

4.2.2.2 SWM Pond

The existing SWM pond has a maximum permanent pool depth of 0.6 m, 4H:1V side slopes, and a berm in the midsection of the pond that will create an extended flow path, which will allow for additional settling of suspended solids. Surface water runoff volumes up to the 5-year storm event will be discharged via the riser pipe outlet. The outlet structure provides 24 hours of extended detention for the 25 millimetre (mm) storm event runoff volume.

In the case of water quality concern (i.e., spill) within the Site, the riser pipe outlet is equipped with a sluice gate which can be closed to contain the impacted water and temporarily prevent discharge from the pond up to a 5-year storm event. The waters will be tested and disposed in accordance with the applicable guidelines and via appropriate means and methods.

The SWM pond with a permanent pool volume of 1,266 m^3 and a total live storage volume in excess of 5,502 m^3 has sufficient capacity to detain the runoff from all storm events up to and including the Regional storm event.

4.2.3 Surface Water Net Environmental Effects

This section documents the net effects assessment for the Brooks Road Landfill Site Expansion Screening from a Surface Water Resources perspective. The net effect analysis is based on the following assumptions:

- The final cover will be vegetated and no pollutants of any kind (i.e., pesticides, herbicides, fertilizers) will be applied to the final cover once it has been fully vegetated.
- Only areas on the final cover and access roads to the north are changing, no other area of the landfill will change slopes or have its drainage significantly re-configured in any way.
- No surface water will ever come in contact with waste. Any surface water that infiltrates through the final cover will be captured by the leachate collection system and treated.
- There will be no leachate seeps or exchange of surface water and leachate.

The proposed expansion of the landfill will increase the imperviousness percent of the contributing drainage areas to the SWM pond by less than 2 percent, and expanded areas will maintain equal precent impervious area as the existing condition with a good vegetative coverage. The design capacity and storage volume for the existing drainage ditches and SWM pond respectively, exceeds the MECP requirements for Enhanced level protection. Therefore, the SWM pond as designed will mitigate all water quality and quantity effects leading to minimal impact to surface water on Site.

Hydrologic modelling results including comparison tables and output files for the existing approved and vertical expansion proposed condition are provided in the Surface Water Assessment Report (see **Appendix A**).

4.2.4 Surface Water Monitoring Requirements

As specified in the Landfill and Industrial Sewage ECAs, the monitoring requirements for the Site includes the following:

– Quarterly grab samples from the monitoring locations,
– Laboratory analysis of grab samples, and
– Annual monitoring reports.

4.3 Geology & Hydrogeology

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that are based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2.0** of this report.

The assessment of effects was carried out by modelling the predicted effects of the landfill on the hydrogeologic regime under the scenario of the proposed expansion. The modelling took into consideration the existing conditions at the Site, the known hydrogeologic characteristics, as documented extensively in previous reports (including the most recent annual monitoring reports), and the proposed modifications to the Site design. Modelling was undertaken to estimate the quantitative and qualitative effects on the local hydrogeologic regime resulting from the lateral expansion of the waste footprint and landfilling of additional waste. The modelling takes into consideration the proposed design, including final cover, the liner system and the leachate collection system. The modelling considered scenarios that included worst-case mass loading to the underlying hydrogeologic regime (i.e., used maximum measured concentrations in leachate between 2017-2021 and considers the period when landfilling is near final capacity and maximum leachate generation volumes were reached).

Modelling included two scenarios. The first scenario involved 6 m of leachate mounding over the composite liner for 50 years, followed by complete failure of the HDPE liner. In this scenario, the leachate collection system and the HDPE liner were modelled with a service life of 50 years in order to maintain consistency with the previously modelled failure scenario. Following the 50 year service period, the HDPE liner was removed from the liner system and the leachate head was maintained at 6 m above the base of the collection system. The second scenario modelled the effect of 6 m of head on the liner system with the HDPE liner entirely absent for the duration of the model.

Appendix A of the Geology & Hydrogeology Assessment Report includes a report entitled Hydrogeologic Assessment – Landfill Expansion, Brooks Road Landfill (GHD, 2022) (Hydrogeologic Assessment Report). This report provides a full description of the hydrogeologic assessment of the proposed landfill expansion design, including descriptions of the methodology, existing conditions and predicted results of the expansion modelling. The results of the modelling demonstrate that the Site design features are sufficiently protective of the local hydrogeologic regime. The results of modelling indicate that concentrations of contaminants of concern entering the basal till aquifer will be reduced by an average factor of 4 prior to off-Site migration.

Groundwater quality is forecasted to be acceptable at the downgradient boundary with respect to the Ontario Drinking Water Standards (ODWS) and Site-specific Reasonable Use Concept (RUC) criteria.

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) for those geology and hydrogeology criteria which might be affected by the project as identified in **Section 2.0**. The effects assessment describes how existing environmental conditions in the Study Areas will change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2.0**, a “Yes” was applied to the following geology and hydrogeology criteria:

Might the Project:

– *Cause negative effects on groundwater quality, quantity, or movement?*

– *Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?*

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.3.1 Geology & Hydrogeology Potential Effects

The potential effects on the geology and hydrogeology environment are related primarily to the release of waste-related contaminants into the subsurface hydrogeologic regime. This release will occur as a result of leachate generated within the waste mound exiting the landfilled waste mass through the bottom or sides of the landfill and migrating into the shallow water table aquifer or the basal till/bedrock aquifer. Leachate-related impacts could travel downward from within the waste mass until reaching the basal till/bedrock aquifer. Once entering this aquifer, the impacts will travel laterally as advective flow in the direction of the natural horizontal hydraulic gradient (to the south).

4.3.2 Geology & Hydrogeology Mitigation Measures

The mitigation measures implemented into the design to reduce or eliminate the potential effects on the geology and hydrogeology environment include:

1. The final cover
2. The leachate collection system
3. The liner system

In addition to these engineered controls, the Site is also situated within a fine-grained (clay-rich) stratigraphic sequence with significant vertical thickness. This natural feature provides additional protection of the underlying aquifer as well as some beneficial attenuation capacity.

Section 6 of the Hydrogeologic Assessment Report provides a fulsome description of the modelling inputs, which includes the relevant design elements of engineered controls and the natural geologic setting. These elements in combination represent the measures which mitigate the potential effects of the proposed landfill expansion.

4.3.3 Geology & Hydrogeology Net Effects

The net effects of the proposed landfill expansion on geology and hydrogeology are those anticipated remaining effects after mitigation measures are applied. Accordingly, the results of the predictive modelling undertaken to estimate the magnitude of groundwater alteration resulting from the Project represent the net effects.

Section 6.5.3 of the Hydrogeologic Assessment Report describes the results of the predictive modelling. The primary receptor of concern with respect to the net effects is groundwater quality within the basal till/bedrock aquifer at the downgradient Site boundary. As described in Section 6.5.3 of the Hydrogeologic Assessment Report, water quality at the downgradient Site boundary within the basal till/bedrock aquifer is predicted to meet ODWS and Site-specific RUC criteria even at peak concentrations under the scenario of leachate collection system failure. On the basis of this predictive modelling, the proposed expansion is expected to result in only negligible or insignificant alterations to the geology and hydrogeology environment.

4.3.4 Geology & Hydrogeology Monitoring Requirements

A comprehensive leachate and groundwater monitoring program (water levels and quality) is proposed. This proposed program includes a trigger level and contingency implementation plan in order to supplement the routine program and

ensure appropriate responses are implemented in the event that water quality results indicate that an undesirable effect on groundwater quality is imminent.

The proposed routine monitoring program and trigger level and contingency implementation plan are outlined in detail in Section 7 of the Hydrogeologic Assessment Report.

4.4 Land Use & Socio-Economic

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2.0** of this report.

The land use and socio-economic existing conditions characterized for each criterion identified in the Screening Criteria Checklist were assessed taking into consideration the project description and Site Plan in order to identify potential effects that may result from the proposed undertaking. Following the determination of potential effects, measures required to mitigate any potential effects were developed and the resulting net effects (with the application of mitigation measures) were determined.

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) for those Land Use criteria which might be affected by the project as identified in **Section 2.0**. The effects assessment describes how existing environmental conditions in the Study Area(s) will change as a result of the construction and operation of the proposed undertaking.

As described in Section 2.0, a “Yes” was applied to the following Land Use & Socio-Economic Criteria:

Might the Project:

– *Use hazard lands or unstable lands subject to erosion?*
– *Result in aesthetics impacts (e.g., visual and litter impacts)?*
– *Cause negative effects related to traffic?*
– *Be located within 8 km of an aerodrome/airport reference point?*

4.4.1 Land Use & Socio-Economic Potential Effects

The proposed undertaking is compatible with planning and by-law documents for the area and will continue to be consistent with the Provincial Policy Statement. Operation of the landfill will not affect land uses within 500 m as all operations will take place within the Site boundaries. BMPs will be implemented by BRE to manage nuisance related effects during construction and operation.

The proposed expansion mayrequire the use of hazard lands or lands subject to erosion such as GRCA-regulated lands. On-site operations may cause potential negative effects on the geology and hydrogeology as well as on the natural habitat and wildlife in this area.

As identified in the Screening Criteria Checklist and Section 3.3.3.5 above, portions of the SSA, Site Vicinity Study Area, and LSA are GRCA regulated areas and zoned as Wetland. The proposed expansion will require GRCA permit to expand within the regulated lands.

As identified in Section 2, there are no potential effects anticipated to neighborhood or community character as the Site of the proposed expansion is located within an area currently zoned as Disposal Industrial. No negative effects on local businesses, institutions, or public facilities are anticipated. There will be no negative impacts on recreation, cottaging, and tourism as there are no recreational lands designated in the SSA and LSA. There will be no increase in the demand for community services and/or infrastructure as a result of the proposed expansion and no change in the economic base of the surrounding community, local employment, or labour supply.

The proposed undertaking is a horizontal and vertical expansion of the existing landfill and will cause an increase in the landfill height and may cause negative visual and aesthetic impact in absence of mitigation measures. However, this will not exceed currently approved peak contours and can be mitigated.

The results of the Transportation Assessment Report (see **Appendix H**) conducted as part of this Environmental Screening Process concluded that the truck traffic associated with the proposed capacity expansion will not contribute any additional traffic within the study area due to maintaining the maximum approved fill rates. With no additional traffic being generated by the Site, minimal impact is expected to traffic safety, and traffic operations. No potential road improvements are required or recommended.

Three local airfields, Cayuga (Bruce Field) Airport, Cayuga East Airport, and Grand River Executive (York) Airport, are located within 8 km of the Site. However, the proposed expansion will not cause negative impacts to the airports and will not interfere with the flight paths as no tall structures, such as stacks, exist or are proposed at the Site.

4.4.2 Land Use & Socio-Economic Mitigation Measures

Potential negative effects on the natural environment and wildlife will be mitigated through BMPs such as the final cover system, leachate collection system, and liner system. In addition to these engineered controls, the Site is also situated within a fine grained (clay rich) stratigraphic sequence with significant vertical thickness. This natural feature provides additional protection of the underlying aquifer as well as some beneficial attenuation capacity. A silt fence is also installed in areas of possible sediment migration.

Detailed mitigation measures are outlined in the Natural Environment Assessment Report (see Appendix B) and Geology and Hydrogeology Assessment Report (see Appendix B)..

With no additional truck traffic generated by the proposed capacity expansion, no mitigation measures are recommended in order to avoid or minimize impacts on transportation.

There is a wire fence around the perimeter of the site. The western part of the existing Site located on Books Road has a visual berm which includes a chain link fence with visual screen as mitigation to visual impact, providing a visual barrier to passersby. The visual screen will be augmented in response to the increased landfill height as a visual and aesthetic mitigation measure.

4.4.3 Land Use & Socio-Economic Net Environmental Effects

Potential negative environmental effects during construction related to dust, odour, noise, and traffic will be mitigated through the use of best management practices.

The results of the Land Use and Socio-Economic Assessment indicate that there will be a change to the current visual scenario as a result of the proposed expansion. However, this can be mitigated by increasing the height of the existing visual screen, vegetating the screening berm and/or introducing additional plantings on the Site. This would minimize views of the Site from surrounding areas.

4.5 Air Quality

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) for those Air Quality criteria which might be affected by the project as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Areas will change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2**, a “Yes” was applied to the following geology and hydrogeology criteria:

Might the Project:

- *Cause negative effects on air quality due to emissions (for parameters such as temperature, thermal treatment exhaust flue gas volume, nitrogen dioxide, sulphur dioxide, residual oxygen, opacity, hydrogen chloride, suspended particulates, or other contaminants)?*
- *Cause negative effects from the emission of greenhouse gases (e.g., carbon dioxide, carbon monoxide, methane)?*
- *Cause negative effects from the emission of dust or odour?*

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.5.1 Air Quality Potential Effects

4.5.1.1 Potential Odour Effects

Ontario does not have an odour standard. However, a value of one odour unit (OU) is sometimes used by the MECP as a limit for odour impacts at sensitive receptors such as residences. Based on the existing conditions odour studies, it has been shown that the frequency of exceedances of the odour levels at the nearest sensitive receptors will not exceed than 0.5% for any modelled year.

As discussed previously, the estimated landfill gas production for the Site is extremely small and is not expected to result in any off-Site odour impacts.

Additionally, GHD conducted numerous odour analyses in 2014, 2016, 2017, 2019 and 2022, and concluded that there were high on-Site odour levels near the leachate tank and the working face in the earlier studies but were lower in the 2019 studies after the installation of the leachate treatment system. Odours at the concentration currently observed at the Site typically do not result in complaints at off-Site sensitive receptor locations. This has been investigated through numerous odour monitoring programs that did not identify any on-Site odours being observed at off-Site locations.

Lastly, the Site currently implements several operational measures in order to reduce and/or mitigate odour impacts from the Site and will continue to implement these operational measures. These include:

- Continuing with the daily odour monitoring program carried out by the Site Operator.
- If odours are evident on the property boundary, increase the amount of daily cover applied on the waste.
- Minimize the active working face. Apply interim cover at a minimum thickness of 300 mm on areas of the landfill where landfilling has ceased for 6 months or more.
- Continue with the use of odour control granules for odour mitigation. Assess areas of placement and their effect on odour mitigation.

4.5.1.2 Potential Air Quality Effects

The air contaminant of concern for this Site is particulate matter. Other air contaminants are expected to be insignificant. As previously discussed, potential tailpipe and brake and tire wear emissions from vehicles operating at the landfill are insignificant. Also, the estimated landfill gas production of only 297 m^3/hour (175 cubic feet per minute) confirms that any potential off-Site impacts of compounds in the gas, such as methane, will be insignificant.

Particulate is primarily produced by vehicle traffic on the landfill roads. The particulate matter that is of concern is based on the re-suspension of particulate matter from traffic on the roads. The tailpipe and brake and tire wear has been determined to be insignificant sources of particulate matter. The Ontario ambient air quality criterion for TSP is

120 µg/m^3 on a 24-hour basis. There are other particulate provincial and federal criteria for PM_{10} and $PM_{2.5}$. These particulate emissions will also occur from vehicle traffic on the landfill roads.

It is GHD's experience that if one can show compliance with the TSP standard, a site with road traffic being the major source, then the PM_{10} and $PM_{2.5}$ concentrations will also be below criteria.

However, for completeness, GHD has modeled the TSP, PM_{10} and $PM_{2.5}$ emissions in the assessment of the alternatives.

The TSP, PM_{10} and $PM_{2.5}$ emissions from the on-Site roads were estimated based on truck traffic and emissions factors from the United States Environmental Protection Agency (USEPA).

Particulate off-Site concentrations were estimated using the AERMOD air dispersion model which is an approved dispersion model under O. Reg. 419/05. The AERMOD model incorporates five years of meteorological data to determine the worst-case air concentration. Therefore, the modeling results can be considered to be conservative.

The on-Site haul roads were previously modelled for 50 trucks per day. This is the same amount of daily trucks proposed in this amendment. The Site has paved the on-Site roadway from the Site entrance to the landfill as was identified in the previous study.

TSP, PM_{10} and $PM_{2.5}$ from the Site were previously evaluated at the property boundary and all residential dwellings. The predicted worst case particulate impact at the property boundary is as follows:

– TSP – 50 trucks per day – 122.4 µg/m^3
– PM10 – 50 trucks per day – 64.18 µg/m^3
– PM2.5 – 50 trucks per day – 8.8 µg/m^3

The predicted maximum worst case particulate impact at the sensitive receptors is as follows:

– TSP – 50 trucks per day – 5.78 µg/m^3
– PM10 – 50 trucks per day – 4.56 µg/m^3
– PM2.5 – 50 trucks per day – 0.61 µg/m^3

MECP AAQC for TSP is 120 µg/m^3, 50 µg/m^3 for PM_{10}, and 27 µg/m^3 for $PM_{2.5}$. The modelled concentration at the sensitive receptors are well below the MECP AAQC for all particulate matter fractions. The modelled concentration at the property boundary is right at the AAQC for TSP and PM10 and the concentration of PM2.5 remains well below the MECP AAQC. There have been no changes to the modelled impacts from the previous application.

4.5.1.3 Climate Change Assessment

The existing landfill operations had an estimated greenhouse gas (GHG) emissions of approximately 15,000 tonnes of CO2equivalents (CO2e) in 2023. With the current landfill approval, the GHG emissions are estimated to reach about 20,000 tonnes CO2e. With the proposed Stage 9 expansion, the GHG emissions are projected to be approximately 22,600 tonnes CO2e. This amounts to an increase in GHG emissions of about 2,600 tonnes CO2e relative to the current landfill's estimated maximum GHG emissions.

Ontario's 2021 GHG emissions were reported to be 150.6 million tonnes CO2e and Ontario's goal is to reach 144 million tonnes CO2e by 2030. The projected increase in CO2e emissions as a result of the Brook Road Landfill expansion (2,600 tonnes) is only 0.002% of Ontario's 2030 GHG emissions target. Therefore, the Brooks Road Landfill GHG emissions can be considered insignificant relative to Ontario's total GHG emissions.

4.5.2 Air Quality Mitigation Measures

The Site has completed numerous mitigation measures since the previous application such as the introduction of SOPs for odour and dust and operation of a leachate treatment system. The Air Quality and Odour were assessed for the proposed conditions in the previous assessment and the identified mitigation measures were implemented. The Site is committed to continuing the mitigation measures.

Construction operations during the expansion may impact TSP emissions from the site. A dust management plan will be developed during the construction period to mitigate these emissions.

4.5.3 Air Quality Net Effects

No change to the net effects from the existing landfill operation are anticipated as a result of the proposed capacity change, based on the continued implementation of the mitigation measures.

4.5.4 Air Quality Monitoring Requirement

There are no additional monitoring requirements at this time.

4.6 Noise

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

Steady State Sound Level Impact Assessment

The worst-case assessment of steady-state noise sources at the selected points-of-reception was based on measured sound pressure levels. CADNA A version 2023 was used to model the potential impacts of the significant noise sources. CADNA A calculates sound level emissions based on the ISO 9613-2 standard “Noises – Attenuation of Sound during Propagation Outdoors”.

The worst-case cumulative Facility-wide attenuated sound levels estimated at the receptor(s) included attenuation affects due to geometric divergence, atmospheric attenuation, barriers/berms, ground absorption and directivity, as applicable for all significant noise sources. Off-Site buildings were input as intervening structures.

Future Landfill Operation Sound Levels

In order to consider future compliance of noise levels from the Site, an evaluation was carried out on the on the predicted sound levels that will be associated with the proposed capacity increase. The criteria for landfilling-related sound levels are established in the MECP guidelines for Site[25], and are as follows:

– 55 dBA for daytime operations (7 am to 7 pm)
– 45 dBA for nighttime operations (7 pm to 7 am)

The assessment considered the potential changes in existing truck traffic routes on-Site and on the haul route to support the proposed capacity increase.

These noise sources are input into an industry standard Noise model that includes all significant on-Site structures (buildings, equipment, storage tanks and silos). CADNA A version 2023 is based on the ISO 9613-2 standard “Noises – Attenuation of Sound During Propagation Outdoors – Part 2: General Method of Calculation.” The CADNA A model is the industry standard for environmental noise modeling in Ontario.

The worst-case cumulative Site-wide sound levels estimated at the receptor(s) included attenuation effects due to geometric divergence, atmospheric attenuation, barriers/berms, ground absorption and directivity, as applicable significant noise sources at off-Site buildings were input into the model as intervening structures.

In order to predict the future worst-case noise impacts from the Project activities, representative octave band noise data was used, measured from construction/processing equipment similar to what is noted to be required for the Project. This data was obtained from the United Kingdom’s Department of Environment Food and Rural Affairs

[25] MECP’s NPC-300 “Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning,” October 2013.

(DEFRA) Update of Noise Database for Prediction of Noise on Construction and Open Sites, 2005 and 2006 (common source used globally). The United States Department of Transportation, Federal Highway Administration (FHWA) document FHWA Roadway Construction Noise Model User's Guide, 2006 was used as a supplemental document to obtain sound level data for equipment not listed by DEFRA.

Final (near closure) landfill topography was selected to evaluate the worst-case noise impact exposure for off-Site residences based on the final vertical expansion. The final landfill topography elevates the source height and documents the worst-case position of the noise sources relative to the off-Site receivers based on line-of-sight. Representative noise specifications were used for all mobile equipment such as trucks and bulldozers and applied to the on-Site travel routes based on the cell development design concept.

Landfill activities and supporting equipment are compared directly against a daytime one-hour Leq sound level limit of 55 dBA for landfill operations for all PORs.

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those Noise criteria which might be affected by the project as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Area(s) will change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2**, a "Yes" was applied to the following Noise criteria:

Might the Project:

– *Cause negative effects from the emission of noise?*

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.6.1 Noise Potential Effects

The proposed capacity increase will result in noise emissions associated with truck movements to/from the Site and on-Site landfill equipment requirements. Fourteen off-Site residential dwellings will be potentially impacted from the existing Landfill activities. The predicted noise impact range is 42 to 53 dBA (rounded). POR5 is the most impacted at 53 dBA. All residential dwellings are below the 55 dBA noise limit.

From a potential noise impact exposure perspective, the future conditions for additional capacity are near identical and the only difference is the potential for truck traffic on the haul route up to 16 trucks per hour during daytime operations only and the elevated height of the tracked vehicles at the worst-case elevation when approaching cell closure.

Noise contours for the proposed Future Conditions are presented on **Figure 4.2**.

4.6.2 Noise Mitigation Measures

Based on the description of the proposed capacity increase provided in **Section 1** and the characterization of Noise Existing Conditions within the Study Areas described in **Section 3**, there are no mitigation measures recommended to be incorporated into the future conditions designs in order to avoid or minimize impacts from Noise. Mitigation measures are not required because the predicted off-Site noise impact meets the applicable 55 dBA regulatory noise limit.

As all residential dwellings are below the 55 dBA noise limit, no specific mitigation measures are required. The implementation of BMPs, as recommended in the Vertical Capacity Expansion EA such as barriers and/or berms at Landfill perimeter and administrative controls that limit on-Site landfilling activities will serve to minimize noise impacts from the Site.

The Site also has a Noise BMP Plan (BMPP) that Facility staff adhere to which was developed in January 2021. The BMPP details the following recommended activities to minimize noise emissions on Site:

4.6.2.1 Equipment Inspection and Maintenance Procedures

As a minimum, the following activities or events shall be inspected and recorded in the inspection logs:

- Monthly inspection of haul routes and roadways will be carried out and maintenance will be performed within 1 month or as soon as conditions will allow
- Unpaved roads and regularly travelled portions of the Site will be re-graded as required
- All on-Site BRE and contractor heavy mobile equipment is to be inspected before first use and annually afterwards to comply with NPC-115 equipment guidelines
- All heavy mobile equipment shall be kept in good working order and fitted with working mufflers if required. Effective Noise control depends on machinery being in good condition and fitted with working mufflers

4.6.2.2 Best Practices and Control Measures for Landfilling Activities

Landfill operators, machine operators and contractors are recommended to review and follow the practices and controls as outlined below:

- All heavy mobile equipment activities will be limited to daytime hours (07:00 to 19:00 hours).
- All heavy mobile equipment shall be kept in good working order as deterioration may increase equipment sound levels.
- Vehicle movements are recommended to stay within movements areas and reduce the use of back-up alarms, where practical. This should coincide with safety considerations.
- If alternate hauling route is proposed by BRE, a qualified individual should be consulted and approve the change.
- Administrative controls are required to eliminate uncontrolled tailgate banging and the use of experienced equipment operators.
- Where equipment back-up alarms will be used near areas that are potentially environmentally sensitive, alternative alarms should be used to reduce sound levels and annoyance. Ambient adjustable, strobe light or broadband alarms are options to consider.
- Landfilling activities should be limited to daytime hours (07:00 to 19:00 hours).

It is noted that due to improvements in operations and change in waste acceptance type has limited the Landfill's issues with pests over the last two years and have never used a audible pest control system. Should pest control devices or similar activities be utilized in the future these systems will be assessed for noise to ensure no negative off-Site noise impacts prior to operation.

4.6.2.3 Recordkeeping

Records shall be kept of when and how Noise control measures are implemented and when complaints, if any, are received. Example of a complaint form is provided in Appendix D. The form will be updated every 5 years or upon employee turnover. As a minimum, the following activities will take place if a complaint is received:

- Complaints or concerns expressed directly to contractors or Site personnel should be communicated immediately to the Site Manager so the formal complaint process can be initiated and followed up
- The complaint form will provide the description of the complaint, environmental conditions, operations at time of incident, and description of all responses and follow up actions
- Reporting will be conducted with the intent to manage any potential Noise issues through operational changes to construction and landfilling
- If the complaint is valid or persistent (i.e., not an upset condition), investigation through sound level measurements will be conducted and reported
- On an annual basis, the complaint records will be reviewed and any unfavourable trends will be examined further to identify corrective actions and included in the annual report

4.6.3 Noise Net Environmental Effects

Similar to the Vertical Capacity Expansion EA and Fill Rate Amendment Screening, the 14 residences that were anticipated to experience a change in the predicted off-Site noise impact due to the previously approved landfill expansion, may continue to hear landfill activities; however, even with the increased capacity, no change from the noise analysis completed as part of the Vertical Capacity Expansion EA and Fill Rate Amendment will occur. With existing mitigation measures and best practices, all residential dwellings are below the 55 dBA noise limit.

4.6.4 Noise Monitoring Requirements

No monitoring requirements are needed for on-going noise compliance.

4.7 Natural Environment

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

The assessment of the proposed capacity expansion was conducted in two steps:

- **Step 1: Confirm Screening Criteria and Indicators/Measures**
  Prior to undertaking the net effects assessment, the Natural Environment screening criteria, indicators, and measures were reviewed and confirmed for application to the proposed capacity expansion
- **Step 2: Undertake the Net Effects Analysis**
  With the screening criteria, indicators, and measures confirmed through the preceding step, a net effects analysis of the proposed capacity expansion was carried out consisting of the following activities:
  - Identify potential effects (based on measures) on the Natural Environment
  - Develop and apply avoidance/mitigation/compensation/enhancement measures
  - Determine net effects on the Natural Environment

General Assumptions

The following evaluation was carried out under the assumption that the 2023 Design and Operations Report (GHD 2023) for the Brooks Road Landfill Site depicts the most up-to-date conceptual design for the proposed capacity

expansion. Should the conceptual design change, the need for mitigation and the potential for net effects will need to be reassessed.

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those Natural Environment criteria which might be affected by the project as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Areas will change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2** (**Table 2.1**), a "Yes" was applied to the following Natural Environment criteria:

Might the Project:

– *Cause negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat?*

– *Cause negative effects on designated wetlands?*

– *Cause negative effects on wildlife habitat, populations, corridors, or movement?*

With respect to the above criteria, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.7.1 Natural Environment Potential Effects

4.7.1.1 Cause Negative Effects on Rare (Vulnerable), Threatened or Endangered Species of Flora or Fauna or their Habitat

There are several rare (vulnerable), threatened or endangered species of flora and fauna or their habitat within the LSA and/or SSA. The proposed capacity expansion could have a negative effect on these species and/or habitats, potentially causing the species to become extirpated (i.e., locally extinct).

4.7.1.2 Cause Negative Effects on Designated Wetlands

The proposed capacity expansion will result in changes to the existing landfill footprint,, final contours, and on-Site operations and may cause negative effects on designated wetlands. PSWs are present on all sides of the Site and are also located within the southeastern boundary of the SSA. The proposed capacity expansion could cause negative effects to the PSWs through changes in water quality, impacts to wetland habitat, and impacts to flora and fauna species.

4.7.1.3 Cause Negative Effects on Wildlife Habitat, Populations, Corridors, or Movement

The proposed capacity expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause negative effects on wildlife habitats, populations, corridors, or movements. The MNDMNRF's Natural Heritage Information Centre (NHIC) mapping delineates Wildlife Activity Area (WAA; white-tailed deer wintering area) throughout most of the SSA and LSA. The proposed capacity expansion will not reduce the available WAA.

4.7.2 Natural Environment Mitigation Measures

There are a number of existing mitigation measures in place to dissuade wildlife access to the existing landfill Site and to prevent human/wildlife conflicts. Chain link fence is present around the perimeter of the property, which dissuades larger reptile and mammal access to the Site. Based on the proximity to the PSW, a wildlife exclusion fence was installed in December 2021 within the chainlink fence as an effective deterrent for small reptile, amphibian, and mammal access to the Site. Also, in December 2021, a new silt fence was installed along the northern perimeter of the

property and at several locations around the Site where run-off potential is high. There are also very limited natural areas on the landfill Site itself and daily landfilling activities (e.g., noise, human presence, heavy machinery) also provide deterrents for wildlife use of the Site. Other operational practices (i.e., daily cover) further act to deter wildlife use of the Site.

General BMPs for continued operation of the landfill should include:

– Notify Site operators and delivery contractors of the presence of reptiles and amphibians in the surrounding areas. This includes visual identification tools for SAR common to the area.
– Any wildlife incidentally encountered during Site operation activities will not be knowingly harmed and will be allowed to move away from the area on its own if at all possible.
– In the event that an animal encountered during Site operation activities does not move from the area, or is injured, the Site Supervisor will be notified.
– In the event that the animal is a known or suspected SAR, the Site Supervisor will contact MNDMNRF SAR biologists for advice.
– Wildlife exclusion fence and erosion and sediment controls shall be maintained until all disturbed areas of the Site, including the pond and swales, have fully stabilized and vegetated areas have achieved 70 percent of the native background density of growth. The condition of all swales, culverts, vegetation, infiltration basin outlet, and outflow channels leading to the Brooks Road drainage ditch and off Site will be noted at regular intervals.

4.7.3 Natural Environment Net Effects

The proposed capacity expansion will migrate the northern landfill perimeter north by approximately 30 m. This land is already within the Site boundary and within the chainlink, wildlife exclusion, and silt fences; as such, net effects are anticipated to be negligible. **Table 4.3** details the potential effects, mitigation measures, and net effects on the Natural Environment.

Table 4.3 Natural Environment Potential Effects, Mitigation Measures, and Net Effects

Screening Criteria	Indicators	Potential Effects	Mitigation Measures	Net Effects
Negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat	Predicted impact on flora and fauna including rare (vulnerable), threatened, or endangered species	Potential to cause species to become extirpated (i.e., locally extinct)	Chainlink and wildlife exclusion fence to prevent fauna entering Site No clearing to be conducted outside of the Site boundary	No net effects to flora and fauna within the Site and Local Study Areas
	Predicted impact on flora and fauna habitat	Clearing and grubbing may cause destruction to flora and fauna habitat	No clearing or grubbing to be conducted outside of the Site boundary	No net effects to flora and fauna habitat within the Site and Local Study Areas
Negative effects on designated wetlands	Predicted changes in water quality	Water quality could deteriorate with the migration of sediment from the landfill into the wetland	Silt fence is installed in areas of possible sediment migration	No net effects to water quality in designated wetlands within the Site and Local Study Areas
	Predicted impact on wetland habitat	Wetland habitat could deteriorate with the migration of sediment from the landfill into the wetland	Silt fence is installed in areas of possible sediment migration	No net effects to wetland habitat in designated wetlands within the Site and Local Study Areas
	Predicted impact on flora and fauna	Migration of sediment from the landfill into the wetland may have	Silt fence is installed in areas of possible sediment migration	No net effects to flora and fauna in designated wetlands

Screening Criteria	Indicators	Potential Effects	Mitigation Measures	Net Effects
		a negative impact on flora and fauna		within the Site and Local Study Areas
Negative effects on wildlife habitat, populations, corridors, or movement	Predicted impact on wildlife habitat	WAA (white-tailed deer wintering area) is present throughout most of the SSA and LSA and the increased footprint may reduce the available WAA	Existing chainlink and wildlife exclusion fence prevent fauna entering Site. The proposed expansion is confined to the fenced Site	No net effects on wildlife habitat within the Site and Local Study Areas
	Predicted impact on wildlife populations	The proposed capacity increase may lead to reduced or increased wildlife populations	The proposed expansion is confined to the existing Site boundary	No net effects on wildlife populations within the Site and Local Study Areas
	Predicted impact on habitat linkages within the Local Study Area	The proposed capacity increase may impact habitat linkages in the Local Study Area	The proposed expansion is confined to the existing Site boundary	No net effects on habitat linkages within the Site and Local Study Areas

4.7.4 Natural Environment Monitoring Requirements

To ensure that the mitigation measures identified are implemented as envisioned, a strategy and schedule was developed for monitoring environmental effects. With these mitigation measures and monitoring requirements in mind, commitments have also been proposed for ensuring that they are carried out as part of the construction, operation, and maintenance of the proposed undertaking.

Calling Amphibian Monitoring

Calling amphibians are recommended to be monitored annually to confirm there is no migration of sediment from the proposed capacity expansion (i.e., from grading throughout the SSA, final cover construction) is not causing negative impacts to the wildlife inhabiting the surrounding wetlands. Monitoring should focus on Locations 1 through 4, as the potential impacts to the natural environment at Locations 5 and 6 are considered to be negligible given their distance from the SSA. These annual monitoring events should be conducted during Year 1, Year 2, and every three years following for a minimum of four monitoring events, commencing in the first year of construction. When conducted in accordance with the Marsh Monitoring Protocol (BSC 2009).

Surface Water Quality Monitoring

The Site currently implements a surface water monitoring program based on the requirement of ECA No. A110302. The surface water monitoring program includes water quality monitoring and surface water flow measurements. This program consists of a network of nine monitoring stations (one on-Site and eight off-Site) indicated in **Figure 3.22** and is conducted to confirm run-off is not causing negative impacts to the wetland. Water quality monitoring and surface water flow measurements at all of the surface water stations take place on a quarterly basis (generally March, May, August, December) with an attempt to correlate the surface water monitoring with rainfall events. Continuation of this program provides a reasonable monitoring effort for potential effects monitoring. Further information on surface water quality monitoring is available in the *Design and Operations Report* (GHD 2022).

Fencing Inspections

The following measures will be conducted to mitigate potential effects associated with the perimeter wildlife exclusion/silt fence and confirm that it is effective:

– Routine inspections of the integrity of the perimeter wildlife exclusion/silt fence. Inspections are to be conducted quarterly with copies of the inspection reports maintained on-Site for two years

- Incidental observations of wildlife exclusion/silt fence or perimeter chainlink fence disrepair and/or evidence of wildlife attempting to enter the SSA should be reported immediately to the Site Supervisor or Site Manager and addressed in a timely fashion
- Any fencing disrepair is to be addressed by BRE in a timely fashion

4.8 Traffic

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2.0** of this report.

Based on the description of the proposed capacity increase provided in **Section 2.0** and the characterization of Transportation Existing Conditions within the Study Area described in **Section 3.0**, the following section provides the Transportation Future Conditions within the Study Areas and any recommended mitigation measures for the 2026 horizon year when the Site is anticipated to reach capacity. The future conditions traffic analysis utilizes the existing 2022 conditions as a baseline and incorporates additional corridor growth to the traffic volumes.

As previously presented in **Table 3.9**, the maximum daily truck traffic before and after the proposed capacity expansion does not change and remains at 25 to 50 trucks per day. As a result, the turning volumes entering and exiting the Site access are not expected to change from exiting conditions.

Horizon Year

The proposed capacity expansion for the existing Site is expected to extend the life of the landfill by approximately two years from 2024 to 2026. Therefore, a future horizon year of 2026 has been assumed representing the worst-case scenario which includes the anticipated corridor growth expected until the Site reaches capacity. Haldimand County's Traffic Impact Study Guidelines for developments generating less than 500 peak hour vehicle trips requires future conditions traffic analysis be conducted for both the opening year and 5 years after opening. However, post 2026, the Site will generate no traffic onto the surrounding road network and therefore, analysis of future conditions was limited to the 2026 horizon year.

Background Volume Growth Rate

In order to capture any expected background growth in traffic volumes at the study area intersections, a conservative compound annual growth rate of 2.0 percent has been adopted and will be utilized to forecast for the 2026 traffic volumes.

Future Traffic Volumes

The Forecasted 2026 turning movement counts were projected at both the intersection of Highway 3 and Brooks Road and at the existing Brooks Road Landfill Site driveway during the weekday a.m., mid-day and p.m. peak periods and Saturday mid-day peak periods. This includes the existing truck traffic corresponding to approximately 1,000 tonnes per day. As previously noted, to provide a conservative and worst-case scenario analysis, the daily truck trips associated with the Site were applied to each peak hour (i.e., the total amount of daily truck trips will enter/exit the Site within each of the peak hours). The resulting weekday a.m., mid-day and p.m. peak hour as well as the Saturday peak hour volumes are summarized in **Figure 4.3**. No additional Site trips were accounted for in the 2026 horizon year as the maximum daily number of trucks generated by the Site remains at 25 to 50 trucks after the proposed capacity expansion.

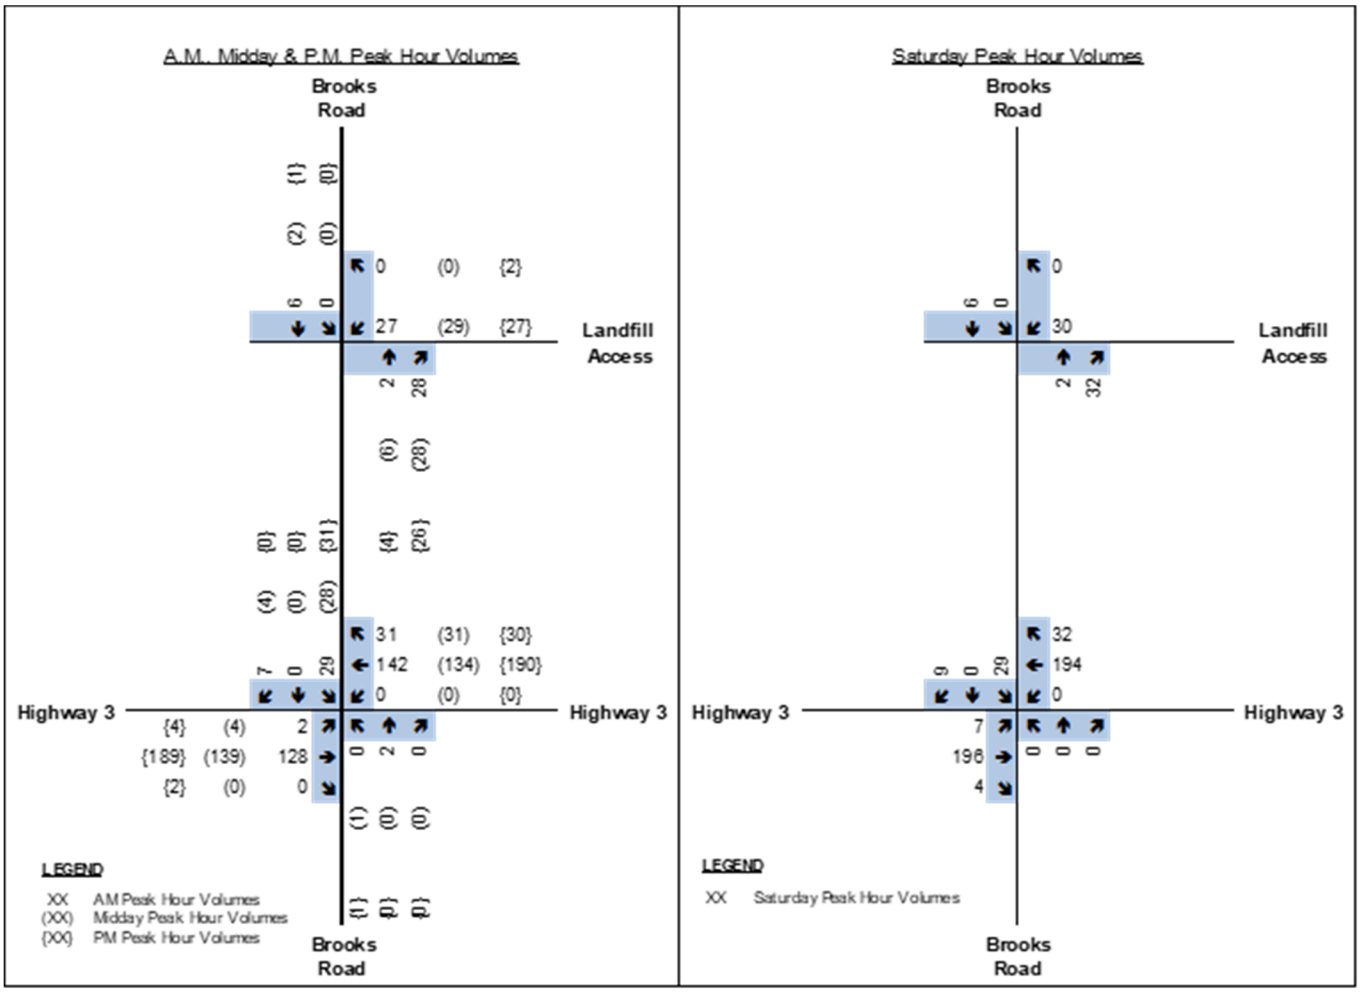

Figure 4.3 2026 Future Total Peak Hour Volumes

Capacity Analysis

As a measure of the capacity on the adjacent road network surrounding the Brooks Road Landfill at peak operations (i.e., 1,000 tonnes of material per day translating to 25 to 50 daily trucks), both the Site access on Brooks Road and the stop-controlled intersection of Brooks Road and Highway 3 were analyzed using the projected 2026 peak turning movement volumes for the weekday a.m., mid-day, p.m. and Saturday peak hours. A summary of the capacity analysis using Synchro version 10 is summarized in the **Table 4.4** with detailed reports provided in Appendix A of the Traffic Assessment Report (**Appendix H**).

Table 4.4 Future Conditions Capacity Analysis at Peak Operations

Intersection	Movement v/c ratio (LOS) delay			
	A.M. Peak	Mid-Day Peak	P.M. Peak	Sat Peak
Brooks Road & Brooks Road Landfill Site access	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0 SEC	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0 SEC	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0 SEC
Brooks Road & Highway 3	EBTLR = 0 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS B 11 SEC SBTLR = 0.06 LOS B 11 SEC	EBTLR = 0 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS B 11 SEC SBTLR = 0.05 LOS B 11 SEC	EBTLR = 0 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS B 12 SEC SBTLR = 0.06 LOS B 12 SEC	EBTLR = 0.01 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS A 0 SEC SBTLR = 0.08 LOS B 12 SEC

Both intersections overall are expected to operate with minimal delay and substantial excess capacity under future 2026 conditions. Individual movements at both study intersections are expected to operate with levels of service 'B' or better representing minimal delay, and volume-to-capacity (v/c) ratios not exceeding 0.08 representing substantial excess capacity, during the weekday a.m., mid-day, p.m. and Saturday mid-day peak hours.

The analysis of future 2026 conditions under peak operations confirms no vehicle delay issues or capacity constraints at either study intersection resulting from the proposed capacity expansion.

Safety Analysis

Collision Analysis

Existing conditions collision analysis determined no indication that either Highway 3 in the vicinity of Brooks Road or Brooks Road north to the Site has experienced significantly higher collision frequency than the historical average accident rate along Highway 3 in Haldimand County. Since no additional Site traffic is generated by the proposed capacity expansion, safety conditions remain unchanged.

Sight Line Analysis

Existing conditions sight line analysis determined the Site entrance in its current location satisfies the sight distance requirements for trucks approaching and departing from the Site.

As described in **Section 2.0**, a "Yes" was applied to the following Transportation criteria:

Might the Project:

– Cause negative effects related to traffic?

With respect to the above criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed.

4.8.1 Traffic Potential Effects

Based on the Future Conditions traffic analysis undertaken in this section, it is expected that the proposed capacity expansion will have a negligible transportation effect at the study area intersections and surrounding road network. Truck traffic associated with the proposed capacity expansion will not contribute any additional truck traffic within the study area, therefore it is not expected to adversely affect residents, businesses, institutions and movement of farm vehicles in the local study area.

4.8.2 Traffic Mitigation Measures

With no additional truck traffic generated by the proposed capacity expansion, no mitigation measures are recommended in order to avoid or minimize impacts on Transportation.

4.8.3 Traffic Net Environmental Effects

As no mitigation measures beyond those incorporated into the design are recommended, the net impacts of the capacity expansion from a transportation perspective are expected to be negligible as represented in the Future Transportation Conditions analysis undertaken in this section.

4.9 Cultural Heritage

Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48(1) of the Ontario Heritage Act. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out an archaeological assessment, in compliance with Section 48(1) of the Ontario Heritage Act.

The Funeral, Burial and Cremation Services Act, 2002, S.O. 2002, c.33 requires that any person discovering human remains must cease all activities immediately and notify the police or coroner. If the coroner does not suspect foul play in the disposition of the remains, in accordance with Ontario Regulation 30/11 the coroner shall notify the Registrar, Ontario Ministry of Public and Business Service Delivery, which administers provisions of that Act related to burial sites. In situations where human remains are associated with archaeological resources, the Ministry of Citizenship and Multiculturalism should also be notified (at archaeology@ontario.ca) to ensure that the archaeological site is not subject to unlicensed alterations which would be a contravention of the Ontario Heritage Act.

4.10 Other

The proposed landfill expansion will not change the types of wastes the facility is permitted to receive and will not result in the creation of non-hazardous waste materials requiring disposal (the landfill currently receives non-hazardous wastes as permitted by the existing Environmental Compliance Approval).

The proposed expansion will not cause any other negative environmental effects not covered by the criteria outlined in this presentation.

4.11 Summary of Net Environmental Effects

Table 4.5 provides a summary of the anticipated net environmental effects associated with the proposed facility.

Table 4.5 Net Effects Summary Table

Environmental Component	Summary of Predicted Net Environmental Effects
Surface Water	– Continuous operation of the stormwater management pond to remove the excess TSS and ensuring good vegetative coverage in the expanded areas to reduce erosion will result in no net effects on surface water quality on-site or off-site. – Slight change in drainage areas. The proposed expansion of the landfill will increase the imperviousness percent of the contributing drainage areas to the SWM pond by less than 2 percent. However, the SWM pond capacity is sufficient to accommodate this change. – No off-site effects to surface water quantity with continued operation of the stormwater management pond to attenuate peak flows to protect downstream receivers from potential changes in water quantity.

Environmental Component	Summary of Predicted Net Environmental Effects
Geology & Hydrogeology	– The Site is characterized by two relevant groundwater units (a water table unit and a confined basal till overburden/shallow bedrock aquifer) which are separated by a thick layer of stratified silty clay, silty clay till and varved clays which form an aquitard of very low hydraulic conductivity. – The proposed landfill design includes a base constructed of a single composite liner design consisting of a 1.5 mm thick high density polyethylene (HDPE) liner overlying a 750 mm thick engineered clayey liner. – Leachate produced within the landfill will be collected in a leachate collection system installed above the HDPE liner and will be removed from the landfill mound on a continuous basis and treated on Site prior to discharge. – Based on the existing leachate and groundwater quality at the Site and the high level of protection provided by the engineered composite liner and the natural silty clay aquitard, as well as the continuation of a robust monitoring and trigger level program, no net effects to the groundwater quality are anticipated from the proposed expansion.
Land Use & Socio-Economic	– The Site is located in an area zoned as Disposal Industrial. Potential negative effects during construction related to dust, odour, noise, and traffic will be mitigated through the use of BMPs. – There are no net negative environmental effects anticipated with respect to Land Use for the operation from the proposed expansion. – There are no net negative environmental effects anticipated with respect to traffic. – By implementing the height increase of the existing fence on the west side of the Site will mitigate any visual and aesthetic impacts. – No net negative effects are anticipated with respect to Land Use and Socio-Economic environment from the proposed expansion
Air Quality	– The assessment shows that the concentrations of TSP, PM10 and PM2.5 were all well below the AAQC at the sensitive receptors and will continue to be so with the proposed amendment. The cumulative effect for PM2.5 was below the PM2.5 AAQC at the sensitive receptors as well. – The Site has implemented the control measures such as the introduction of SOPs for odour and dust and the operation of a leachate treatment system and will continue with these controls to minimize the Air Quality and Odour impacts from the Site operations. – No change to the net effects from the existing landfill operation are anticipated as a result of the proposed capacity change, based on the continued implementation of the mitigation measures

Environmental Component	Summary of Predicted Net Environmental Effects
Noise	– The BRE Facility is located in a mixed acoustical Class 2 and Class 3 area based on the MECP NPC 300 guideline and depending on the proximity of the off-Site residential dwellings to Highway 3. – Nine residential dwellings located along Highway 3 are considered to be Class 2 receivers and the five residential dwellings situated away from the corridor are considered to be Class 3 receivers. N-1 is the applicable regulatory Guideline for compliance assessment purposes for the Facility and the proposed capacity increase requires that the BRE Facility achieve a noise limit of 55 dBA at all off-Site residential dwellings of concern. The Landfill is limited to daytime only operations from 7 a.m. to 7 p.m. The Existing Conditions at the BRE Facility are below the 55 dBA noise limit. – The capacity increase considers one future conditions evaluation which will remain well below the Guideline N-1 noise limit of 55 dBA at all existing sensitive points of reception. –
Natural Environment	– The proposed capacity expansion will migrate the northern landfill perimeter north by approximately 30 m. This land is already within the Site boundary and within the chainlink, wildlife exclusion, and silt fences; as such, net effects are anticipated to be negligible.
Traffic	– The analysis of future conditions undertaken for the 2026 horizon year when the Site is anticipated to reach maximum capacity, indicates the site will continue to be acceptable from a traffic operations and safety perspective. – Under peak operations no vehicle delay issues or capacity constraints at either study intersection are expected. – Concerning safety, it is expected that since no additional site traffic is generated by the proposed capacity expansion, existing safety conditions will not deteriorate, and Site traffic will continue to be safely accommodated by the existing site entrance; therefore, there are no net negative effects.
Cultural Heritage	– The screening checklist, Criteria for Evaluating Archaeological Potential, developed by the Ministry of Citizenship and Multiculturalism, was completed as part of the Environmental Screening Report (see **Appendix G1**) determining that archaeological potential within the study area is low and therefore archaeological assessment was not undertaken. – The screening checklist, Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes, developed by the Ministry of Citizenship and Multiculturalism, was completed as part of the Environmental Screening Report (see **Appendix G2**) determining that the study area has low potential for built heritage resources and cultural heritage landscapes. Therefore, no technical cultural heritage studies have been undertaken.

5. Consultation and Engagement

BRE strived to openly communicate the facts of the Project to various stakeholder groups who might be affected by the Project. The stakeholder groups who have been consulted include Government Agencies, Indigenous Communities, and the public (**Table 5.1**).

The consultation activities described in the following sections, and the consultation documentation provided in **Appendix K** were developed in accordance with the consultation expectations set out in the *Ontario Environmental Assessment Act*, MECP's Code of Practice for Preparing and Reviewing Environmental Assessments in Ontario[26], and in MECP's Guide to Environmental Assessment Requirements for Waste Management Projects[27].

5.1 Consultation Activities

BRE has consulted with various stakeholder groups in a number of ways, ranging from verbal communication, email correspondence and the delivery of presentations, to the organization of consultation events. The major consultation milestones held and organised by BRE include:

– Circulation and Publication of the Notice of Commencement and Notice of Public Open House – weeks of June 13 and 20, 2022
– Public Open House #1 – June 29, 2022
– Public Open House #2 – October 24, 2023

5.1.1 Notice of Commencement and Public Open House # 1

As noted above, BRE commenced the Environmental Screening process with the publication of a Notice of Commencement and Notice of Public Open House in the Sachem/Glanbrook Gazette and Haldimand Press, the local newspaper in the vicinity of the proposed Site, during the weeks of June 13 and 20, 2022. The Notice of Commencement was also distributed via letter and/or email to members of the Government Review Team, Indigenous Communities, and to 1,674 addresses within N0A postal code, covering the town of Cayuga, via unaddressed Canada Post mail-drop during week of June 20, 2022. The Notice was also posted on the BRE Project website (www.brenvironmental.com) in the “About Brooks Road” and the “2022 Environmental Screening” section. A copy of the Notice of Commencement and Public Open House is provided in **Appendix I**.

5.1.2 Public Open House #1

Public Open House # 1 was held on June 29, 2022 at the Cayuga Kinsmen Community Centre, 15 Thorburn Street South, Cayuga from 5 p.m. to 7 p.m. Notification of this first public Open House was included in the Notice of Commencement, published in the Sachem/Glanbrook Gazette and Haldimand Press during the weeks of June 13 and 20, 2022 and sent via letter and/or email to the contacts on the preliminary Project Contact List, inviting interested stakeholders and members of the community to attend the event. As noted above, a copy of the Notice of Commencement and Public Open House is provided in **Appendix I**. The first Public Open House included an overview of the Environmental Screening Process, including the Screening Criteria Checklist, and preliminary information about the proposed expansion. The objective was to offer opportunity to discuss and solicit feedback and comments on the proposed undertaking. A total of 14 individuals attended Public Open House #1. Attendees included local residents and landowners; members of the Public Liaison Committee for the existing landfill; and a member of the media. Comments and questions (both verbal and written) were welcomed and are summarized in the Public Open House #1 Summary Report along with copies of the display boards and reference material (see **Appendix I**).

In general, the comments ranged from against the proposal to supportive. A majority of comments received during the Open House related to the operations of the existing landfill. Landowners within the immediate vicinity of the Site asked questions regarding the possible height of the expansion, visual impact, odour, noise, wetland protection, potential for impacts to surface and groundwater, traffic, Site life, and post-closure use. Overall, there was good dialogue between the staff and the attendees.

5.1.3 Public Open House #2

Public Open House #2 was held on October 24, 2023 at the Cayuga Kinsmen Community Centre, 15 Thorburn Street South, Cayuga from 6 p.m. to 8 p.m. Notification of the second Public Open House was published in the Sachem online and Haldimand Press newspaper during the weeks of October 12 and 19, 2023 and sent via letter and/or email to the Government Agencies, Indigenous Communities, Project Contact List and to 2,019 addresses within N0A postal code, covering the town of Cayuga, via unaddressed Canada Post mail-drop during week of October 19, inviting interested stakeholders and members of the community to attend the event. Copies of notification for the second Public Open House is provided in **Appendix I**. The second Public Open House included an overview of the Environmental Screening Process, detailed project description, results of various environmental studies conducted

including potential effects, mitigations measures and overall net effects from the proposed expansion along with any monitoring requirements as well as project schedule. The key information presented at the second Open House was the change in planned capacity increase from previously proposed 100,000 cubic metres to 219,400 cubic meters as a result of the change in O. Reg 101/07. The objective was to offer opportunity to discuss and solicit feedback and comments on the proposed undertaking. A total of 13 individuals attended the Public Open House #2. Attendees included local residents and landowners; members of the Public Liaison Committee for the existing landfill; a municipal staff, and a member of the media. Comments and questions (both verbal and written) were welcomed and are summarized in the Public Open House #2 Summary Report along with copies of the display boards and reference material (see **Appendix I**).

Similar to Open House #1, the comments ranged from against the proposal to supportive. A majority of comments received during the Open House related to the Regulation change allowing BRE to seek an increase in the total capacity requested (change from the 1st Open House) as well concerns around the overall timing of the landfill operations and ultimate closure. Residents asked questions regarding the increased height of the expansion from a visual perspective, concerns around landfill liner design, odour, wetland protection, and eventual post-closure use. Overall, there was good dialogue between the staff and the attendees.

5.2 Stakeholder Tracking Database

A stakeholder tracking database was created for the BRE Landfill Expansion Project and includes a list of names and contact information for all stakeholders, serving as a starting point for all project-related communication (see **Appendix I**).

5.3 Indigenous Community Consultation

From the outset of the Screening Process, BRE established and maintained regular contact and communication with Indigenous Communities in the region of the proposed undertaking. A total of four Indigenous communities were contacted including:

– Six Nations of the Grand River First Nation
– Mississaugas of the New Credit First Nation
– Métis Nation of Ontario (Head Office, Niagara Region Métis Council, and Hamilton-Wentworth Métis Council)
– Haudenosaunee Confederacy Chiefs Council

As required at the start of the Screening Process, a copy of the Notice along with the Screening Checklist was provided to each of the Indigenous groups listed above. All four Indigenous Communities were also invited to attend Public Open House #1 and #2 and offers were also extended to organise separate meetings specifically designed to engage each community in meaningful discussions concerning the project. Follow-up phone calls were made in June 2022 to each community to confirm whether they had received the Notice of Commencement and Open House 1 and if they had any questions. A virtual meeting with the Mississaugas of the Credit First Nation was held on July 19, 2022.

A member of the Six Nations of the Grand River First Nation reached out to have a meeting with the project team in response to the Notice of Open House #2. An in-person meeting was held on January 12, 2024, to discuss the project and outcomes with the project team and members of the Six Nations.

None of the consulted Indigenous communities provided comments during Online Open House #2.

Copies of all correspondence with Indigenous communities are included in **Appendix I**.

5.4 Review of the Draft Environmental Screening Report

A Draft ESR was issued to the government agencies from January 8 to February 5, 2024 and to the indigenous communities, public, and interested stakeholders from January 16 to February 13, 2024 with an opportunity to review

and provide comments. According to the Guide, this step is highly encouraged to address any fundamental concerns or to avoid disagreement being raised at a late stage in the process and any technical issues can be suitable resolved prior to the preparation of a final ESR and issuance of a Notice of Completion.

The comments on the Draft ESR along with the responses are summarized and included in **Appendix I**.

5.5 Notice of Completion

As part of the process of making the ESR available for review, BRE issued a formal Notice of Completion to review agencies, Indigenous Communities, and the public beginning on April 3, 2024. A copy of the Notice is included in Appendix J. Specifically, this involved the following activities:

– Publication in the Haldimand Press and Sachem online within the Hamilton Spectator.
– Letter and/or email to members of the Government Review Team, Indigenous Communities, PLC members, and interested members of the public.
– Canada Post mail blast to postal code N0A, within a 5 km radius of Brooks Road Landfill.

The Environmental Screening Process requires proponents to post the ESR for a minimum 60-calendar day review period. The Brooks Road Landfill vertical and horizontal ESR was available for review from April 3, 2024, to June 2, 2024, whereby any interested person can inspect the Environmental Screening Report and provide comments. The comments, including any issues or concerns, should be sent first to GHD, on behalf of the BRE, for potential resolution.

5.6 Summary of the Comments Received & Responses Provided

Over the course of the Screening Process, numerous comments have been directed to BRE and the Project Team. **Table 5.2** summarizes the questions and concerns raised at meetings and obtained via regular mail, email, fax, telephone from members of the public, agencies, PLC and Indigenous Communities

Table 5.2 Summary of Comments Received and Responses Provided

Topic	Agency/ organisation/ community	Comment	Response
Agencies			
Consultation	GRCA	I've recently been assigned Haldimand County coverage for the GRCA. Please include me on the circulation list for this project going forward.	Thank you for your response. We will add you to the contact list. Should we continue to include planning@grandriver.ca in addition to yourself?

Topic	Agency/ organisation/ community	Comment	Response
Consultation	GRCA	no need to include the general GRCA planning email. Also, wondering if any of the public engagement materials from the open house will be posted on Brooks Road's document library either before or after the session. Not sure if I'll be able to make the session, and they'd also be helpful for circulating our Natural Heritage staff. Let me know if you can.	Yes, we will be posting all of the Public Open House display boards to the document library on the website following the event next week. We will also hold a Government Review Team meeting during the Environmental Screening Process to present and discuss the project and provide an opportunity for agencies to ask questions.
Consultation	OPP	My name is Rod LeClair and I'm with the OPP Provincial Liaison Team. Our role is to maintain open lines of communication with groups who may be affected by major events such as protests or demonstrations. I'm not sure if you're familiar with our team or not. We are aware of the Brooks Road Landfill Capacity Expansion project in Cayuga that is currently at the environmental screening process stage. I have been checking your website for information. We would like to attend any meetings in the future about this project if you would be so kind to add me to your distribution list.	Thank you for your message. You have been added to the project contact list, as requested. We will keep you informed of upcoming project events as well as project notices.
Consultation	MECP	Please find attached MECP's Letter of Acknowledgement and attachments in response to the Notice of Commencement for Brook Road Landfill Capacity Expansion Environmental Screening.	Comment recorded in the communication log.
Consultation/ Land Use	NPCA	NPCA staff provide the following preliminary screening comments regarding the Brooks Road Landfill Expansion Environmental Assessment (with accompanying map): – The subject property is located outside NPCA's watershed jurisdictional area; however, a portion of the northern property line borders our jurisdiction.	Comment recorded in the communication log.

Topic	Agency/ organisation/ community	Comment	Response
		– The subject property is adjacent on all sides (including the area within NPCA's jurisdiction) to Provincially Significant Wetlands, specifically the North Cayuga Swamp Wetland Complex. – Given the above, the proposed landfill expansion will not require a permit from NPCA, however we will review and comment on the proposal to ensure the proposed works do not negatively impact the PSW within our jurisdictional area. Please continue to circulate updates and materials regarding this project to NPCA (directly to me is fine).	
Indigenous Communities			
Consultation/Open House 2	Six Nations	Phone Call – In response to the email notification of Open House #2, requested a separate in-person/online meeting to discuss the project	Email sent by GHD proposing multiple meeting times. Followed up on the meeting time to schedule the meeting. Currently waiting for a response.
Public			
Consultation		Two ongoing concerns: Stink, and noise from tracked vehicles.	Comment recorded in the communication log.
Consultation		**Comments Questions Suggestions** <u>Vegetated screening berm (with fence)</u> – Increase fence height as required for increased height of land fill. – Start planting trees on berm for wind screening and visual appeal. <u>Buffer area</u> – Start planting permanent vegetation and trees if not already in progress. <u>Proposed expansion and temporary fill storage</u> – The area along the north boundary and maybe other areas not visible from the road.	Comment recorded in the communication log.

Topic	Agency/ organisation/ community	Comment	Response
		– Plant cover crop, vegetation – better than weeds – May be an opportunity for farmers. – Achieves dust, erosion and runoff control. – Plant permanent vegetation and trees as slopes are completed. <u>Dust control</u> – Due to increased height of fill, use portable windscreens on hilltops as capacity. – expansion progresses. – Reference Stelco Nanticoke coal fields. <u>Stormwater management pond</u> – Plant native species typical of marsh – Improve filtering and subsequent runoff water quality. <u>Odour and gaseous emissions</u> – Found answers to most of my concerns in the FAQ section: – Are smelly additions perfumed or are they treated? – Treat with “odour control product”, hydrogen peroxide or some other oxidizer other than – bleach? – Aerate or vacuum the build-up with underlayed temporary piping as it progresses? – Has a ground gas collection and treatment system been installed? – If not will it be installed as filling progresses? <u>Future use</u> – toboggan hill!	

Topic	Agency/ organisation/ community	Comment	Response
Consultation		Keep your garbage in Metro Toronto. Pollute there instead of finding out of city locations to destroy with your arrogance. Your last expansion was suppose to be the last!!	Comment recorded in the communication log.

6. Overall Advantages and Disadvantages of the Project

In accordance with the *EA Act* and the Guide, the advantages and disadvantages to the environment of the proposed undertaking are required under O. Reg. 101/07. Advantages are positive net environmental effects, and disadvantages are negative net environmental effects. The advantages and disadvantages are based on the net effects described in **Section 4** and the problem/opportunity and purpose of the undertaking described in **Section 1.4**. The purpose of this exercise is to provide an overall conclusion as to whether the net negative environmental effects of the Project are acceptable, based on a balanced assessment against the positive benefits, the screening criteria, and the results and conclusions of the screening process.

In general, the advantage of the Project is that it will provide BRE with an opportunity to respond to the growing demands from existing customers (waste generators) who need a safe and reliable waste management facility for their residual material for approximately two additional years. This includes the ability to accommodate BRE's customers facing seasonal volume increases at certain times of the year (i.e., increased construction generated wastes). The assessment completed demonstrate that there are no net negative environmental effects to increasing the total waste disposal capacity by 219,400 m³. Based on the net effects evaluation and the advantages outlined above, the advantages of this Project outweigh any potential disadvantages as there are no new net negative effects on the environment.

7. Next Steps

Publishing of the Notice of Completion marks the beginning of the 60-calendar-day review period, during which time agencies, Indigenous communities, the public, and other interested parties can review the Environmental Screening Report and provide comments.

If there are outstanding concerns that the Project may adversely impact constitutionally protected Aboriginal and treaty rights, which cannot be resolved in discussion with BRE, then a person or party may request that the Minister make an order for the Project to comply with Section 16 of the *Environmental Assessment Act*. This is referred to as a Section 16 Order, which addresses Individual Environmental Assessments.

If no Section 16 Order requests are received within the 60-day review period, or if a Section 16 Order request is resolved or withdrawn, a Statement of Completion form (per Schedule II of the Guide to Environmental Assessment Requirements for Waste Management Project) will be submitted to the MECP. Upon acknowledgment of the Statement of Completion by the MECP, an application to amend ECA No. A110302 will be prepared and submitted to the MECP by BRE.

8. Summary and Conclusion

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, initiated an Environmental Screening process in accordance with the Waste Management Projects Regulation (O. Reg. 101/07) of the Ontario *Environmental Assessment Act* (EA Act) in order to amend the existing Environmental Compliance Approval (ECA) for the landfill. The landfill is currently approved to receive up to 1,000 tonnes per day and 250,000 tones per year of post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste and has a total approved capacity of 1,045,065 cubic metres (m^3) (including waste and daily/final cover).

Brooks Road Environmental is seeking to expand the total waste disposal capacity by approximately 219,400 cubic metres and consequently to amend the approved ECA to change the approved maximum volumetric capacity for the site including waste and daily cover from 1,045,065 cubic metres to approximately 1,264,465 cubic metres, to change the approved footprint fill area from 6 ha to approximately 7.15 ha and, to change the approved maximum elevation of the fill zone, including final cover from 221.50 metres above mean sea level (mAMSL) to 225.66 mAMSL. There is no change to the currently approved fill rate and accepted waste types.

A change in the above-mentioned components requires a modification to Conditions 3(6), 3(8), and 3(8a) of the approved ECA, which specifies the maximum volumentric capacity of the site, approved footprint fill area, and maximum elevation of the fill zone respectively. This ECA amendment is subject to the Environmental Screening Process in accordance with section 13 of the Waste Management Projects Regulation, (O. Reg. 101/07) of the *EA Act*. This change to the landfill will allow brooks Road Environmental to continue serving its existing customer base and to respond to the economic opportunity of providing waste management services to address the continued and growing demand from local and regional customers that require a facility that is permitted to manage the residual materials they generate. It will provide BRE with increased flexibility in terms of how best to serve its existing waste clients while remaining competitive within the marketplace.

Through the Environmental Screening Process, the potential for the Project to result in adverse environmental effects was assessed. From the results of various environmental studies conducted to assess the Project's potential environmental effects, it was concluded that minor environmental impacts are expected. However, through the application of mitigation measures, the Project is not anticipated to result in any new net effects on the environment. As a result, the advantages of the project outweigh the disadvantages.

Appendices

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown on Figure 1.1.

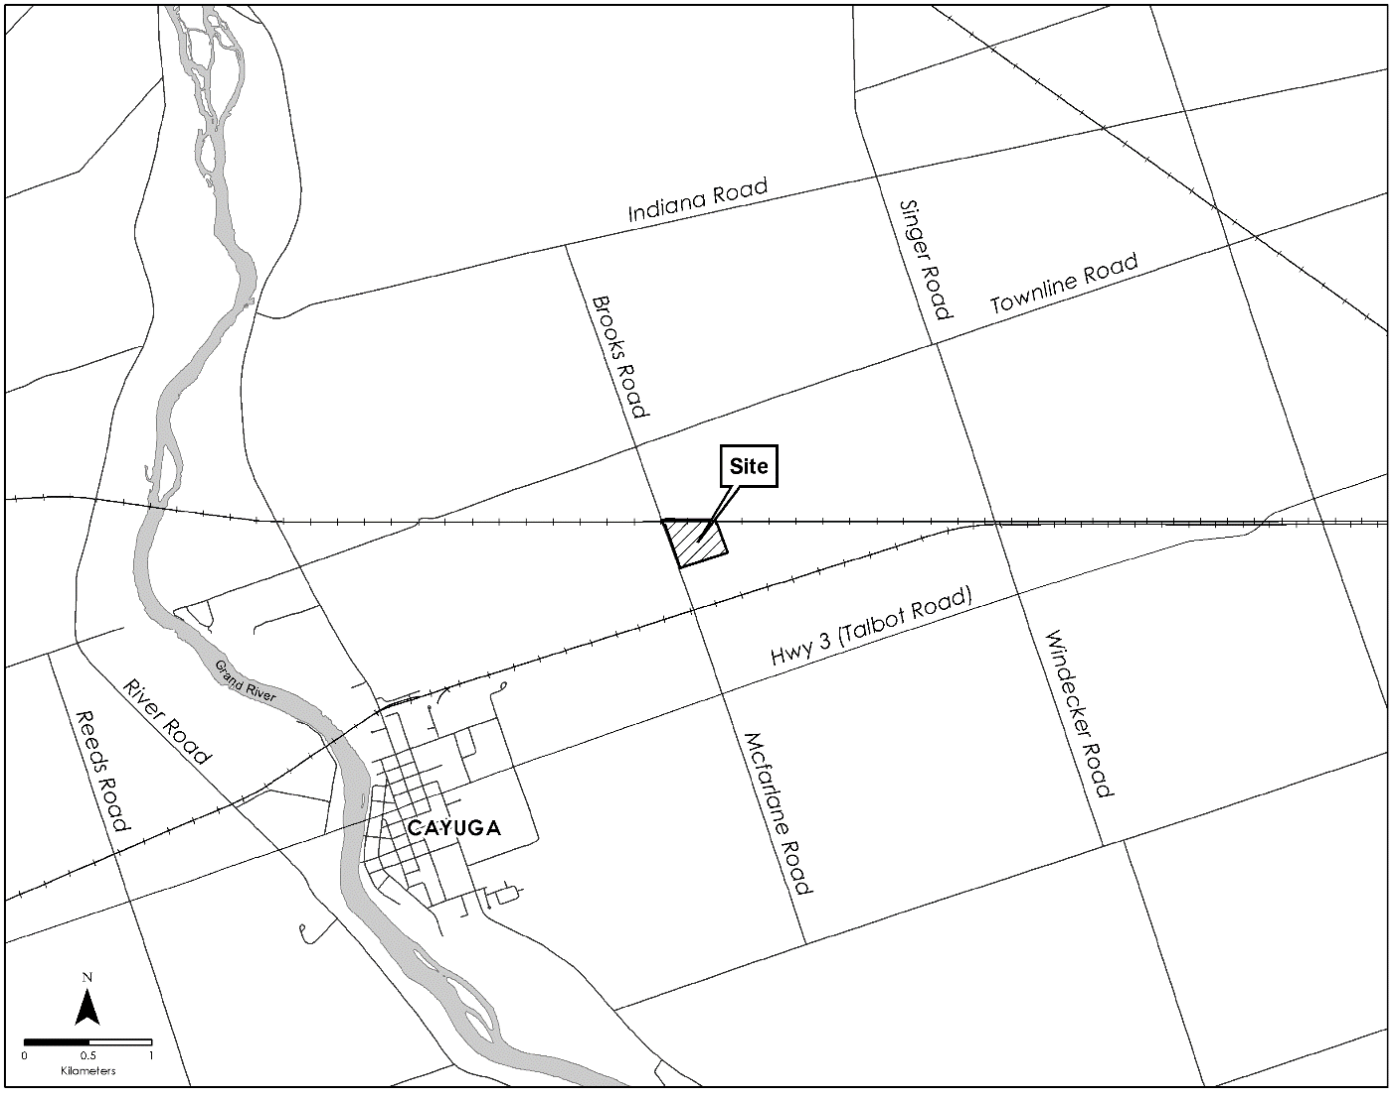

Figure 1.1 Location of the proposed undertaking

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (Landfill ECA), has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA) and industrial sewage works ECA No. 1122-BKUPSM (Industrial Sewage ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the Site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the MECP on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customer for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by approximately 219,400 m^3, adding capacity equal to approximately two additional years. This expansion would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown on Figure 1.2.

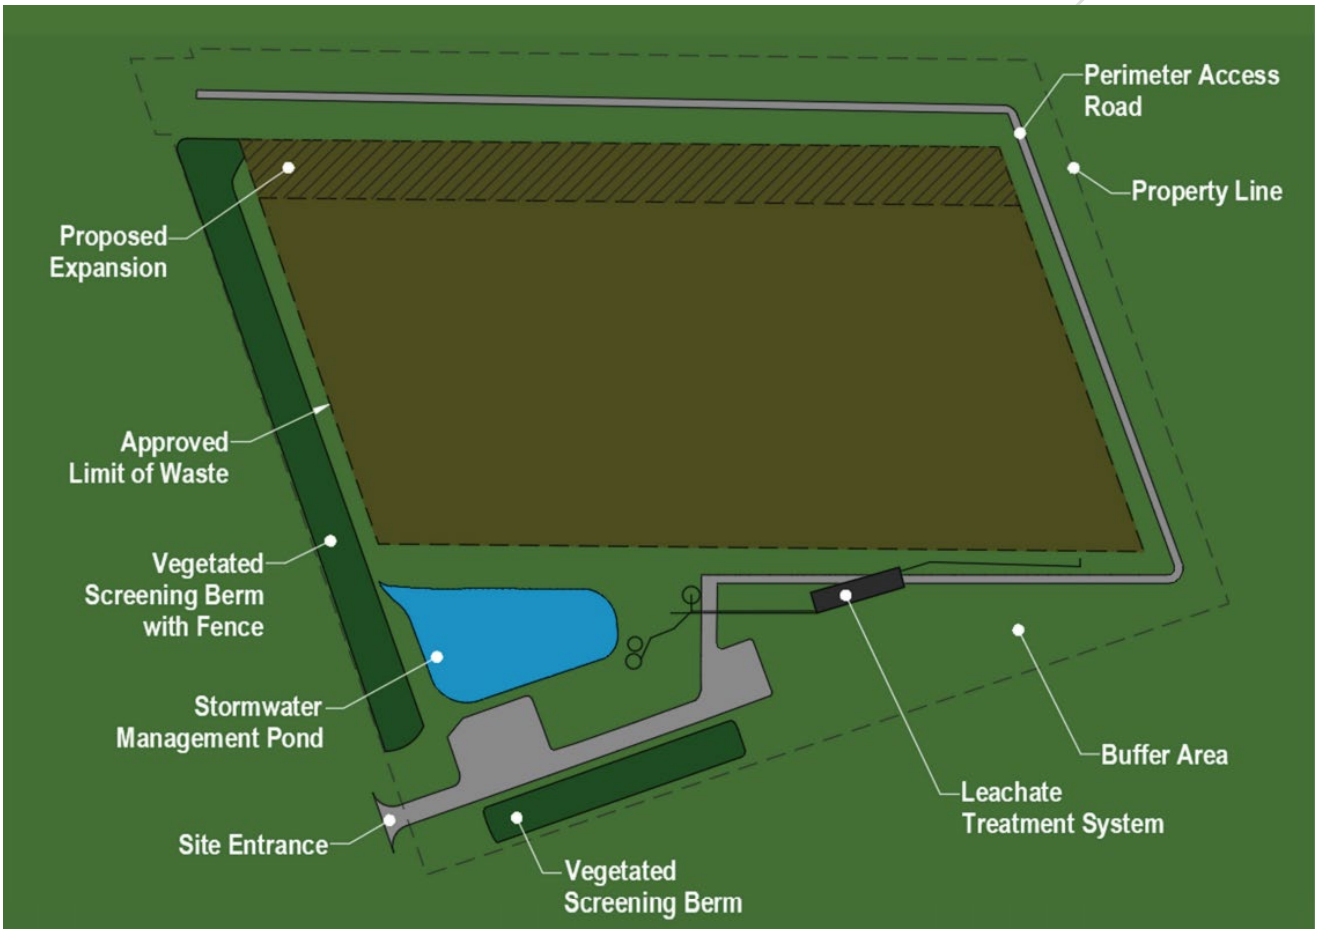

Figure 1.2 Proposed capacity expansion concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by approximately 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:

1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302. The ECA is provided in Error! Reference source not found..

GHD has prepared a Surface Water Assessment on behalf of BRE for the proposed undertaking. This report documents the following as it relates to the surface water environment:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project).
– Potential effects on the environment, mitigation measures, and net effects.
– Future monitoring requirements to be implemented.

The Study Areas reviewed for the Surface Water Assessment were as follows (see **Figure 1.3**):

– **Site Study Area (SSA)** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended.
– **Local Study Area (LSA)** – includes the lands and waters within the vicinity of the Site extending approximately 1 kilometre (km) from the SSA boundaries including agricultural, residential, and municipal properties.

2. Screening criteria checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act.*

As noted in the Guide:

"*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required. Where a "yes' has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion*."

Each criterion is based on a question which is prefaced with the phrase, "*Might the Project*…" Table 2.1 was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Surface Water Assessment. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in Section 4 of this report.

Table 2.1 Screening criteria checklist – surface water

	Criterion	Yes	No	Additional information
	Might the project…			
1. Surface and groundwater				
1.1	Cause negative effects on surface water quality, quantities, or flow?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause potential negative effects on surface water quality, quantities, or flows.
1.3	Cause significant sedimentation or soil erosion or shoreline or riverbank erosion on or off site?		X	The proposed landfill expansion will result in changes to the existing landfill footprint, final contours, and on-Site operations and may cause some sedimentation on- or off-Site; however, it is not anticipated to be significant.
1.4	Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment.

3. Existing conditions

The following subsections describe the existing conditions that are found within the SSA and LSA of the proposed project.

3.1 Methodology

3.1.1 Available secondary source information collection and review

Available secondary sources of information were collected and reviewed by the Surface Water Study Team to determine existing surface water conditions within the Study Areas. The following sources of secondary information were collected and reviewed:

– Ministry of the Environment, Conservation, and Parks (MECP) Stormwater Management Planning and Design Manual (MECP, March 2003)
– Stormwater Management (SWM) Plan (Conestoga-Rovers & Associates (CRA), September 2013)
– Surface Water (SW) Resources Assessment Report for the Brooks Road Landfill Site, Vertical Capacity Expansion Environmental Assessment (GHD, July 2016)
– Design and Operation (D & O) Report Landfill Expansion Report 81 Revision 1 (GHD, June 2021)
– 2021 Operations and Monitoring (O & M) Report, Brooks Road Landfill Site (GHD, March 2022)

3.1.2 Process Undertaken

The process undertaken for the Surface Water Assessment on the Site includes the following:

– Background Review
– Existing Site Conditions Review
– Field Investigation Review (based on the current surface water monitoring program)
– Proposed Expansion Assessment
– Potential effects, mitigation measures and net effect analysis

3.2 Description of existing conditions

The On-Site drainage patterns are similar to those described in the SWM Plan (2013) and SW Resources Assessment Report (2016). The Site stormwater management practices currently operate under Amended ECA Nos. 1122- BKUPSM, issued in February 2020. The Site drainage network is being configured to the Post Closure Condition, illustrated on Figure 5 of the 2013 SWM Plan. The SWM Plan and SW Resources Assessment are provided in **Appendix B** and **Appendix C**, respectively.

The LSA includes slough forest, woodlot, agricultural, residential, and municipal properties. The SSA topography is very flat with a slight 0.003 metre/metre (m/m) horizontal gradient to the south. The topography across the LSA from north to south ranges from approximately 202 metre above mean seal level (m AMSL) to approximately 196 m AMSL.

The existing SWM drainage characteristics within the Site as described in the SWM Plan and D&O report includes the following:

– Site stormwater runoff is discharged from two outfalls. Runoff from the undeveloped area of land located at the south-east corner of the Site (catchment 100) discharges through Outfall 1. The remainder of the Site discharges through Outfall 2. The existing flow schematic is presented on Figure 2.

– The majority of the Site areas discharge to the existing SWM pond through perimeter ditches including landfill cap areas (Catchments 201-204), areas between the landfill perimeter access road and the visual screening berms to the north and west (Catchments 205-206), segregated recyclable material storage areas, Site trailers, scales (Catchments 207-208) and areas that encompass the pond (Catchments 209-210).
– The rest of the Site areas which are largely undeveloped areas (Catchments 301-303) discharge towards Outfall 2.

A summary of the existing subcatchment parameters for contributing drainage areas to the SWM pond is presented in Table 3.1.

Table 3.1 Existing subcatchment parameters for contributing drainage areas to SWM pond

Catchment ID	Area (ha)	Slope (%)	Imperviousness Area (%)	Imperviousness Area (ha)	SCS Curve Number
201	2.62	25	5	0.13	73
202	0.85	25	7	0.06	73
203	0.88	25	5	0.04	72
204	2.64	25	8	0.21	73
205	1.85	50	0	0.00	74
206	0.13	2	5	0.01	72
207	0.38	2	95	0.36	98
208	0.26	2	95	0.25	98
209	0.27	2	5	0.01	72
210	0.43	10	100	0.43	98
Total	10.31				

Notes:
– Source: Stormwater Management Plan 2013 (Table 3)

The existing stormwater controls on Site include drainage ditches and the SWM pond which are summarized in subsequent sections.

Although the Site is on the boundary of two watersheds and the conditions are primarily ephemeral, the surface water drainage pattern meanders through road-side ditches, farmland, and Norton's Creek to the Grand River, located approximately 7 km from the Site.

3.2.1 Monitoring program

As specified in the Landfill ECA, a surface water monitoring program was developed to assess the surface water quality within the Site and downstream of the Site to ensure compliance with the ECA requirements, Water Management Policies, Guidelines, Provincial Water Quality Objectives (PWQO), published by the MECP in July 1994, and reprinted February 1999. The current surface water monitoring program includes monitoring of surface water quality and quantity, through water sampling and flow rate measurements, respectively.

The surface water monitoring network is currently comprised of nine monitoring locations which includes the following:

– Three off-site background locations: SW1, SW8, and SW9. All three have been established to document the background water quality in the local ditches and ponds. SW9 is located immediately north of the Site, north of OW3A/B-13 monitoring well
– Two On-Site surface water monitoring locations: include one pond (SW5) located in the southern portion of the Site and one On-Site surface water ditch (SW2) located at the discharge from the surface water management system (SWMS)

– Four off-Site surface water monitoring locations: include two ponds (SW6 and SW7) located to the south of the Site; one drainage ditch located immediately downstream of the Site discharge point (SW3), and one drainage ditch (SW4) situated approximately 1 km south and downstream of the Site along Highway No. 3

The surface water monitoring locations are presented on **Figure 3**.

Water quality monitoring and surface water flow measurements at all surface water stations is scheduled to take place on a quarterly basis in March, May, August, and November. An attempt is made to correlate the surface water monitoring with rainfall events. As such, the John C. Munro Hamilton International Airport in Mount Hope, ON Hamilton Airport), located approximately 24 km to the north, is often used to schedule surface water monitoring events.

The comprehensive list of specific surface water parameters analyzed during the monitoring program includes:

– General parameters: Alkalinity, conductivity, chloride, ammonia, nitrate, nitrite, TKN, total phosphorus, TDS, pH, TSS, sulphate, BOD5, COD, phenol, pH
– Metals: arsenic, barium, boron, cadmium, chromium, iron, lead, mercury, copper, zinc
– Organics: ethylbenzene, benzo(a)pyrene, naphthalene
– Field parameters: conductivity, pH, temperature, and dissolved oxygen

The parameter list for the current monitoring period (2021) is provided in Table 5.7 of the 2021 O&M report. The results of surface water monitoring are discussed in Section 5.

4. Potential effects, mitigation measures & net effects

A Project Description, which includes proposed engineering design figures, was prepared so that potential environmental effects and mitigation measures could be identified. The following subsections provide a general summary of the proposed undertaking.

4.1 Description of project components and activities

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in Table 4.1.

Table 4.1 Summary of proposed Brooks Road Landfill capacity expansion design vs existing landfill

Design component	Existing landfill	Proposed capacity expansion
Volume (m^3)	1,045,065	1,264,465
Footprint area (ha)	6.07	7.15
Peak elevation (mAMSL) (top of final cover)	221.50	225.66
Peak elevation – top of waste (mAMSL)	220.75	224.91
Crest of slope elevation (mAMSL)	221.0	225.30
Slopes (top/sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing SWM Plan.
Stormwater drainage ditch		Stormwater drainage ditch shifted by 30 m. East and west ditches will extend to maintain full perimeter ditch.
Perimeter roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum daily truck traffic	25 to 50	25 to 50
Post-closure leachate generation rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Methodology and investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

The assessment of effects was achieved by conducting a hydrologic modelling of predicted effects of the landfill on surface water based on the proposed expansion scenario. The existing computer model PCSWMM 2012 Version 5.0.022 was updated to complete a hydrologic analysis to estimate changes in peak flows and runoff volumes from the Site under various storm event conditions for the proposed vertical expansion. Distinct design storm hyetographs were created in PCSWMM, based on the Environment Canada's Rainfall Intensity Duration Frequency (IDF) Values for the Hamilton Airport. The 2, 5, 10, 25, 50, and 100-year 24- hour, SCS Type 2 distribution, storm events were considered in the hydrologic modelling to provide a design basis for on Site SWM features (quantity control).

The stormwater management system for the Site was designed to provide water quality and water quantity control of surface water runoff. Water quality treatment is provided through extended detention of the 4-hour duration 25 mm storm event. The SWM pond is designed to provide water quantity control for all storm events up to the 100-year storm, via attenuation of peak flows to below the Pre-Development Condition. Estimated runoff from the Regional Storm (Hurricane Hazel) has been assessed to demonstrate an ability to safely convey flow to downstream receivers.

At a minimum, internal drainage ditches were sized to accommodate the peak flow generated from the 3-hour duration 25-year storm, as required by the MECP Guidelines.

The effects of the proposed landfill expansion on surface water is forecasted to be minimal based on the minor changes in contributing drainage areas in SSA.

4.3 Surface water net effects

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those Surface Water criteria which might be affected by the project as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Area(s) would change as a result of the construction and operation of the proposed undertaking.

As described in Section 2, a "Yes" was applied to the following Surface Water criteria:

Table 4.2 Screening criteria checklist – surface water

	Criterion	Yes	No	Additional information
	Might the project…			
1.1	Cause negative effects on surface water quality, quantities, or flow?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause potential negative effects on surface water quality, quantities, or flows.
1.3	Cause significant sedimentation or soil erosion or shoreline or riverbank erosion on or off site?		X	The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause sedimentation on or off site.
1.4	Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment.

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.3.1 Potential effects on surface water

The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and On-Site operations especially towards the northern side of the Site. These changes may cause negative effects on the following with respect to surface water:

– Surface water quality: minor erosion/soil loss may occur due to steeper slopes for the proposed vertical landfill expansion. Based on the Universal Soil Loss Equation (USLE), an increased slope would lead to increased soil loss due to erosion. The increase in soil loss would be minor as slope is only one of numerous factors that affect

soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of Total Suspended Solids (TSS) and TSS related pollutants (e.g., metals entrained in the soil).

– Surface water quantity: slight increase in runoff peak flows and volumes compared to existing conditions are expected. Based on the updated hydrologic modelling completed, there is no significant increase in runoff peak flow rates or volumes for the proposed landfill expansion compared to the approved existing conditions.

The revised drainage areas are presented on Figure 4 and a summary of the subcatchment parameters for contributing drainage areas to the SWM pond is presented in Table 4.3.

Table 4.3 Proposed subcatchment parameters for contributing drainage areas to SWM pond

Catchment ID	Area (ha)	Slope (%)	Imperviousness Area (%)	Imperviousness Area (ha)	SCS Curve Number
201	3.06	25	5	0.15	73
202	1.48	25	7	0.10	74
203	1.23	25	5	0.06	72
204	3.05	25	8	0.24	73
206	0.14	2	5	0.01	72
207	0.38	2	95	0.36	98
208	0.26	2	95	0.25	98
209	0.21	2	5	0.01	72
210	0.43	10	100	0.43	98
Total	10.24				

4.3.2 Mitigation measures

Mitigation measures such as SWM controls are provided within the Site to convey surface runoff and provide sufficient water quality storage prior to discharge off-site. These control measures will help to attenuate peak discharge for water quantity and meet the water quality requirement in accordance with the MECP Planning and Design Manual 2003 (SWMP Manual). Also, best management practices such as implementing a robust construction period sediment and erosion control program and good vegetative coverage will be established on the final cover of the landfill to reduce erosion and maintain existing hydrologic conditions.

The existing stormwater controls in SSA include drainage ditches and the SWM pond which are summarized in subsequent sections.

4.3.2.1 Drainage ditch

The existing drainage ditches on Site have a maximum depth of 1 m with side slopes of 4H:1V on landfill side and 3H:1V on the perimeter access roadside of the ditches. Surface runoff is conveyed from landfill cap and access road to the SWM pond. The ditches were designed with sufficient capacity to convey flow in excess of that generated by the 100-year or Regional storm.

4.3.2.2 SWM pond

The existing SWM pond has a maximum permanent pool depth of 0.6 m, 4H:1V side slopes, and a berm in the midsection of the pond that will create an extended flow path, which will allow for additional settling of suspended solids. Surface water runoff volumes up to the 5-year storm event will be discharged via the riser pipe outlet. The outlet structure provides 24 hours of extended detention for the 25 mm storm event runoff volume.

In the case of water quality concern (i.e., spill) within the Site, the riser pipe outlet is equipped with a sluice gate which can be closed to contain the impacted water and temporarily prevent discharge from the pond up to a 5-year storm event. The waters will be tested and disposed in accordance with the applicable guidelines and via appropriate means and methods.

The SWM pond with a permanent pool volume of 1,266 m^3 and a total live storage volume in excess of 5,502 m^3 has sufficient capacity to detain the runoff from all storm events up to and including the Regional storm event.

4.3.3 Net effects

This section documents the net effects assessment for the Brooks Road Landfill Site Expansion EA from a Surface Water Resources perspective. The net effect analysis is based on the following assumptions:

– A construction period erosion and sediment control program will be established and maintained through the construction period to minimize sediment migration.
– The landfill cap will be vegetated and no pollutants of any kind (i.e., pesticides, herbicides, fertilizers) will be applied to the cap once it has been fully vegetated.
– Only areas on the landfill cap and access roads to the north are changing, no other area of the landfill will change slopes or have its drainage significantly re-configured in any way.
– No surface water will ever come in contact with waste. Any surface water that infiltrates through the cap will be captured by the leachate collection system and treated.
– There will be no leachate seeps or exchange of surface water and leachate.

The proposed expansion of the landfill will increase the imperviousness percent of the contributing drainage areas to the SWM pond by less than 2 percent. The design capacity and storage volume for the existing drainage ditches and SWM pond respectively, exceeds the MECP requirements for Enhanced level protection. Therefore, the SWM pond as designed will mitigate the water quality and quantity effects leading to minimal impact to surface water on Site.

Hydrologic modelling results including comparison tables and output files for the existing approved and vertical expansion proposed condition are provided in Appendix D.

A summary of the surface water potential effects, mitigation measures and net effects are provided in Table 4.4.

Table 4.4 Summary of surface water potential effects, mitigation measures and net effects

Environmental component	Evaluation criteria	Indicator	Potential effects	Mitigation measures	Net effects
Surface water resources	Surface water quality	Predicted effects on surface water quality on-site and off-site	Based on the USLE, an increased slope would lead to increased soil loss due to erosion. The increase in soil loss would be minor as slope is only one of numerous factors that affect soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of TSS and TSS related pollutants.	Implement a construction period erosion and sediment control program. Continuous operation of the stormwater management pond to remove the excess TSS. Ensure good vegetative coverage on the expanded areas to reduce erosion	No effects on surface water quality on-site or off-site.
	Surface water quantity	Change in drainage areas	Hydrologic modelling update shows no significant increase in runoff peak flow rates or volumes for the proposed landfill conditions compared to the approved existing conditions.	No specific mitigation measures required beyond the continued operation of the stormwater management pond to attenuate peak flows.	Slight change in drainage areas. The proposed expansion of the landfill will increase the imperviousness percent of the contributing drainage areas to the SWM pond by less than 2 percent. However, the SWM pond capacity is sufficient to accommodate this change.
		Predicted occurrence and degree of off-site effects	Hydrologic modelling update shows that the stormwater management pond will attenuate runoff peak flow rates for all storm events modelled.	No specific mitigation measures required beyond the continued operation of the stormwater management pond to attenuate peak flows to protect downstream receivers from potential changes in water quantity.	No off-site effects to surface water quantity.

5. Monitoring requirements and additional approvals

To ensure that the mitigation measures identified in Section 4 are implemented as envisioned, the existing surface water monitoring strategy and schedule as described in Section 3.2.1 for monitoring environmental effects will continue to be implemented On-Site for the proposed landfill expansion. With these mitigation measures and monitoring requirements in mind, commitments have also been proposed for ensuring that they are carried out as part of the construction, operation, and maintenance of the proposed undertaking.

5.1 Monitoring requirements

As specified in the Landfill and Industrial Sewage ECAs, the monitoring requirements for the Site includes the following:

– Quarterly grab samples from the monitoring locations
– Laboratory analysis of grab samples
– Annual monitoring reports
– Routine construction period erosion and sediment control inspections

5.2 Previous monitoring results

The background monitoring locations are typically characterized by concentrations of phosphorus, aluminum, and iron that have consistently been reported above the PWQO. Other parameters that have been occasionally detected at concentrations elevated above their respective PWQOs include: phenolics, chromium, cobalt, copper, vanadium, zinc, toluene, and some Polycyclic Aromatic Hydrocarbons (PAH) parameters.

The water quality results for the 2021 monitoring program indicate the following:

– Background surface water monitoring locations (SW1, SW8 and SW9) during 2021 were generally consistent with historical results
– Historic evidence of PAH, metals, and hardness at monitoring locations SW3 and SW6
– There is no direct evidence that landfilling-related activities are impacting water quality at the downstream surface water monitoring locations (SW4, SW5, SW6, SW7)

The 2021 O&M report is provided in Appendix E.

5.3 Additional approvals

No additional approvals are required for surface water conditions.

6. Conclusion

As indicated in the 2013 SWM Plan, the stormwater management system for the Site was designed to provide water quality and water quantity control of surface water runoff prior to off-site discharge. The SWM pond has sufficient capacity for the proposed expansion of the landfill.

GHD anticipates minimal impact to surface water On-Site based on the updated results from the hydrologic analysis. Therefore, no modification to the SWM pond and ditch capacity is recommended for the proposed landfill expansion.

Based on the ECA requirements, it is recommended that the current surface water monitoring program will continue to be implemented at the same locations with corresponding parameters for the proposed landfill expansion.

Environmental Compliance Approval

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 1122-BKUPSM
Issue Date: February 3, 2020

2270386 Ontario Limited
162 Cumberland St
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd, Lot 24, Concession 1 North of Talbot Road
County of Haldimand

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

A stormwater management facility and a leachate collection, treatment, and disposal system to service the Brooks Road Landfill Site (formerly Edwards Landfill Site), located in Part of Lot 24, Concession 1, North of Talbot Road, Haldimand County, discharging to a roadside ditch along the east side of Brooks Road, consisting of the following:

Leachate Treatment System

A leachate treatment system designed and installed for a Rated Capacity of 200 m³/day to service the Brooks Landfill Site, located at the south-central side of the landfill site, with an effluent discharge system to discharge effluent to a roadside ditch along Brooks Road with a Rated Capacity of 45 m^3 /day, with a Peak Daily Flow of 60 m^3/day and such other removal of effluent from the Landfill Site in compliance with law, including Ontario Regulation 347, and consisting of the following:

- One (1) leachate collection sump located in the south-east corner of Stage One part of the landfill, equipped with one (1) 6.3 L/sec at 14 m TDH pump discharging through one (1) approximately 35 m long 76.2 mm diameter forcemain into the primary settling tank described below.

- One (1) 28 m³ **Primary Settling Tank** receiving leachate from the existing leachate collection sump, equipped with baffle walls and one (1) 7 L/sec at 9.0 m TDH PST pump, three (3) level floats, and pH monitor, discharging through one (1) 500 micron opening strainer installed on the

feed line to an aeration system described below.

- One (1) **Aeration System** comprising of two (2) 114 m³ capacity concrete tanks in series each aeration tank equipped with 1" lateral air diffusers, two (2) air blowers each with 910 m³/hr (530 cfm) capacity at 13 psi head loss, and the second aeration tank fitted with three (3) level floats, discharging via one (1) 66 m³/hr capacity at 106 m TDH feed pump to the Membrane Biofiltration Reactor (MBR) treatment system described below.

- One (1) 200 m³/day Rated Capacity **Membrane Biofiltration Reactor (MBR) Treatment System** consisting 8 mm diameter membranes housed in four (4) 200 mm diameter tubular modules installed in series and providing a filtration surface area of 36.7 m² per module, designed to operate at maximum pressure of 8 Bar (116 psi) at 40º C with a circulation velocity of 3 m/sec, providing a total filtration area of 146.8 m², equipped with one (1) 200 m³/hr capacity MBR recirculation pump to be used to recirculate activated sludge across the membranes, discharging to a UV disinfection system described below.

- Two (2) **UV Disinfection Units** operating in parallel, each unit capable of providing minimum UV dosage of 40 mJ/cm² at a flow of 114 L/min, discharging by gravity to an effluent transfer tank described below.

- Effluent discharge system consisting of:
  - One (1) 12.5 m³ capacity **Effluent Transfer Tank** equipped with one (1) 7 L/sec at 11 m TDH capacity effluent pump and three (3) level floats, to be used as temporary storage tank to transfer effluent to the existing effluent discharge holding tanks described below.
  - Three (3) 150 m³ capacity **Effluent Discharge Holding Tanks.**
  - Discharge piping from the **Effluent Discharge Holding Tanks** and flow measuring device for a Rated Capacity of 45 m^3/day with a Peak Daily Flow of 60 m^3/day, discharging to the roadside ditch.
  - Discharge piping from the **Effluent Discharge Holding Tanks** and control valve for loading of haulage units for lawful removal of effluent from the Site

- One (1) 12.5 m³ capacity **Sludge Storage Tank**, providing approximately eight (8) days sludge storage capacity, equipped with one (1) 7 L/sec at 7 m TDH capacity sludge pump transferring sludge to the landfill for disposal.

- A chemical feed system consisting of:

  Nitrification
  - one (1) 9 L/hr at 44 psi capacity chemical metering pump dosing **magnesium hydroxide** from a dual wall storage tank to the aeration tank described above for alkalinity control.

  Phosphorus Removal
  - one (1) 9 L/hr at 44 psi capacity chemical metering pump dosing **alum** into the feed line of the aeration tank described above for phosphorus removal.

  Acid Cleaning

- one (1) 24 L/hr at 145 psi capacity chemical metering pump dosing **citric acid** into the MBR feed piping during an acid cleaning of the membranes to remove calcified minerals.

Oxidation Cleaning
- one (1) 78 L/hr at 145 psi capacity chemical metering pump dosing **sodium hypochlorite** into the MBR feed piping during a chlorine cleaning of the membranes to remove accumulated sludge.

Alkaline Cleaning
- one (1) 24 L/hr at 145 psi capacity chemical metering pump dosing **magnesium hydroxide** into the MBR feed piping during an alkaline cleaning of the membranes to remove accumulated fats, oil, and grease.

Leachate Collection System

- a leachate collection, transmission, and storage, designed to handle a maximum of 60 m³/day of leachate generated from the site, consisting of two (2) 75.7 L/min capacity leachate pumps and one (1) 50 mm diameter HDPE forcemain.

Stormwater Management System

A stormwater management facility to service the Brooks Road Landfill Site with a total drainage area of 14.91 ha and an approved landfill footprint of 6.07 ha, designed to provide quantity and quality control of stormwater runoff from storm events with up to 1:100 year return frequency, consisting of the following:

Stormwater Management System (SWMS)

A stormwater management system to provide quality and quantity control of stormwater runoff from the site during the active operation and post closure of the landfill site, consisting of the following:

- one (1) perimeter ditch running from the north-east corner of the landfill site along the east side and south side of the landfill foot print, having a 0.3 m bottom width, a minimum of 1.0 m depth, and 3H:1V side slopes on the road side, conveying collected stormwater runoff to a stormwater management pond described below.

- one (1) perimeter ditch running from the north-east corner of the landfill site along the north side and west side of the landfill foot print, having a 0.3 m bottom width, a minimum of 1.0 m depth, and 3H:1V side slopes on the road side, conveying collected stormwater runoff to a stormwater management pond described below.

- one (1) inlet structure including two (2) 600 mm diameter concrete culverts and an open swale covered with turf reinforcement mat discharging into a forebay described below.

- one (1) forebay with approximate length of 29 m, upstream width of 4 m and downstream width of 15 m, a permanent pool depth of 0.60 m, and side slopes of 4H:1V, equipped with a berm with top

elevation 197.85 m AMSL, discharging to a stormwater management pond described below.

- one (1) wet detention stormwater management pond **(SWMS Pond)** to be located on south west corner of the site providing a total storage capacity of 6,768 m³ consisting of a permanent pool storage volume of 1,266 m³ (at elevation 197.85 m AMSL) with a maximum depth of 0.60 m and an extended storage volume of 5,502 m³ with an extended storage depth of 0.34 m (at elevation of 198.19 m AMSL).

- one (1) outlet structure consisting of one (1) 150 mm diameter perforated PVC pipe with an invert elevation of 197.85 m AMSL, equipped with 75 mm orifice plate, an outlet control valve, and one (1) 600 mm x 1200 mm concrete catch basin, discharging to a roadside ditch along the east side of Brooks Road.

- one (1) emergency by-pass structure consisting of a 2.0 meter wide rip-rap spillway at invert elevation of 199.10 m AMSL discharging to a roadside ditch along Brooks Road,

Including all controls and associated appurtenances,

all in accordance with the submitted supporting documents listed in Schedule A.

For the purpose of this environmental compliance approval, the following definitions apply:

"Approval" means this entire document and any schedules attached to it, and the application;

"BOD5" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"CBOD5" means 5 day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in unfiltered sample;

"Daily Concentration" means the concentration of a contaminant in the effluent discharged over any single day, as measured by a composite or grab sample, whichever is required;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for purposes of Part II.1, EPA;

"District Manager" means the District Manager of the Hamilton District Office;

"EPA" means the Environmental Protection Act, R.S.O. 1990, c.E.19, as amended;

"Equivalent Equipment" means a substituted equipment or like-for-like equipment that meets the required quality and performance standards of a named equipment;

"Limited Operational Flexibility" (LOF) means any modifications that the Owner is permitted to make to the Works under this Approval;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Monthly Average Concentration" means the arithmetic mean of all Daily Concentrations of a contaminant in the effluent sampled or measured, or both, during a calendar month;

"Monthly Average Daily Flow" means the cumulative total sewage flow to the sewage works during a calendar month divided by the number of days during which sewage was flowing to the sewage works that month;

"Notice of Modifications" means the form entitled "Notice of Modifications to Sewage Works";

"Owner" means 2270386 Ontario Limited and its successors and assignees;

"OWRA" means the Ontario Water Resources Act, R.S.O. 1990, c. O.40, as amended;

"Previous Works" means those portions of the sewage works previously constructed and approved under an Approval;

"Proposed Works" means the sewage works described in the Owner's application, this Approval, to the extent approved by this Approval;

"Rated Capacity" means the Monthly Average Daily Flow for which the Works are approved to handle;

"Works" means the sewage works described in the Owner's application, and this Approval, and includes Proposed Works, Previous Works, and modifications made under Limited Operational Flexibility.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

I. GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with the description given in this Approval, and the application for approval of the Works.

(3) Where there is a conflict between a provision of any document in the schedule referred to in this Approval and the conditions of this Approval, the Conditions in this Approval shall take precedence, and where there is a conflict between the documents in the schedule, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the documents listed in the Schedule submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The Conditions of this Approval are severable. If any Condition of this Approval, or the application of any requirement of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within thirty (30) days of the change occurring:

(a) change of Owner or operating authority, or both.

(b) change of address of Owner or operating authority or address of new owner or operating authority.

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Partnerships Registration Act.

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the most current "Initial Notice or Notice of Change" (Form 1, 2 or 3 of O. Reg. 189, R.R.O. 1980, as amended from time to time), filed under the Corporations Information Act shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this Condition will refer to this Approval's number.

II. LEACHATE COLLECTION AND TREATMENT FACILITY

3. LEACHATE MANAGEMENT

(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site leachate treatment system

(a) Notwithstanding Condition 3(1), leachate generated at the landfill Site that is not treated using the on-site leachate treatment system shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.

(b) In the event there is effluent from leachate that has been treated in the on-site leachate treatment system that cannot be disposed of to the roadside ditch, such effluent may be disposed of to an off-site facility provided such disposal is completed lawfully, including pursuant to Ontario Regulation 347.

(2) Leachate generated at the Landfill Site that is not treated using the on-site leachate treatment system shall not be discharged to the natural environment at any time.

4. OPERATIONS AND MAINTENANCE

(1) Within six (6) months of the issuance date of this Approval, the Owner shall prepare and submit for approval to the Director and a copy to the District Manager a "Contingency and Remedial Action Plan for the Works (**On-site leachate treatment system**)" which shall provide detailed action plans that will be implemented during any event when the effluent limits set under Condition 6(1) are not met;

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the works.

(b) inspection programs, including frequency of inspection, for the works and the methods or tests employed to detect when maintenance is necessary.

(c) repair and maintenance programs, including the frequency of repair and maintenance for the works.

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager, and

(e) complaint procedures for receiving and responding to public complaints.

(3) The Owner shall maintain the operations manual up to date through revisions undertaken from time to time and retain a copy at the location of the sewage works. Upon request, the Owner shall make the manual available for inspection and copying by Ministry personnel.

5. EFFLUENT OBJECTIVES

(1) The Owner shall use best efforts to design, construct and operate the works with the objective that the concentrations of the materials named below as effluent parameters are not exceeded in the effluent from the Works.

Table 1 - Effluent Objectives	
Effluent Parameter	**Concentration Objective** (milligrams per litre unless otherwise indicated)
CBOD5	5.0
Total Suspended Solids (TSS)	5.0
Total Ammonia Nitrogen (TAN)	1.0
Total Phosphorus (TP)	0.2
Zinc	0.03
Phenols	0.005
Ethylbenzene	0.008

(2) As a further effluent objective, the Owner shall use best efforts to maintain the pH of the effluent from the works within the range of 6.5 to 8.5, inclusive, at all times.

(3) The Owner shall include in all reports submitted in accordance with Condition 12 a summary of the efforts made and results achieved under this Condition.

6. EFFLUENT LIMITS

(1) The Owner shall design, construct and operate the works such that the concentrations of the materials named below as effluent parameters are not exceeded in the effluent from the works.

Table 2 - Effluent Limits	
Effluent Parameter	**Concentration Limit** (milligrams per litre unless otherwise indicated)
Column 1	Column 2
CBOD5	10.0
Total Suspended Solids (TSS)	10.0
Total Ammonia as Nitrogen (TAN)	3.0
Total Phosphorus (TP)	0.29
Toxicity (Daphnia magna)	Non-acutely lethal
Toxicity (Rainbow Trout)	Non-acutely lethal
pH of the effluent maintained between 6.0 to 9.5, inclusive, at all times	

(2) The Owner shall ensure that monitoring results for effluent discharge parameters outlined in Condition 9(3) meet the concentration limits set out in Column 2 of subsection (1).

(3) For the purposes of determining compliance with and enforcing subsection (1):

(a) The Concentration of a parameter named in Column 1 of subsection (1), sampled in accordance with Condition 9(3) shall not exceed the corresponding maximum concentration set out in Column 2 of subsection (1).

(b) The pH of the effluent shall be maintained within the limits outlined in subsection (1), at all times.

(4) In the event of any instance of non-compliance with the effluent limits stipulated under Condition 6(1), the Owner shall implement the "Contingency and Remedial Action Plan for the Works (**On-site leachate treatment system**)" prepared under Condition 3(1), and shall determine appropriate control measures to achieve effluent limits and the time lines for the implementation of identified control measures. The Owner shall submit the proposed control measures and implementation time lines for approval to the Director and a copy to the District Manager.

(5) If compliance with effluent limits are not met within the time lines approved under Condition 6(4), the Owner shall discontinue effluent discharge from the Works and implement off-site disposal of leachate for proper treatment.

(6) In the event that any of the control measures proposed under Condition 6(4) require the installation or an upgrade of the Works, the Owner shall submit an application to the Director for an amendment of this Approval.

7. EFFLUENT - VISUAL OBSERVATIONS

(1) Notwithstanding any other condition in this Approval, the Owner shall ensure that the effluent from the works is essentially free of floating and settleable solids and does not contain oil or any other substance in amounts sufficient to create a visible film, sheen or foam on the receiving waters.

8. SPECIAL CONDITION

(1) The Owner shall operate the roadside ditch discharge system for the On-Site Leachate Treatment System at the approved Rated Capacity of 45 m^3/day and Peak Daily Flow of 60 m^3/day until an approval is issued by the Director to operate the roadside ditch discharge system at a higher rated capacity. To obtain approval for using the roadside ditch discharge system at a higher rated capacity, the Owner shall complete a detailed receiving surface water assimilative capacity study and submit the study report along with a proposal for effluent limits to the Ministry's Regional Technical Support Section for review and recommendation. Upon receiving review comments and recommendation of the effluent limits from the Technical Support Section, the Owner shall submit to the Director an application for amendment of this Approval and a detailed design brief for approval of the higher rated capacity for the roadside ditch discharge system.

9. EFFLUENT MONITORING AND RECORDING

The Owner shall, upon commencement of operation of the sewage works, carry out the following monitoring program:

(1) All samples and measurements taken for the purposes of this Approval are to be taken at a time and in a location characteristic of the quality and quantity of the effluent stream over the time period being monitored.

(2) Leachate grab samples shall be collected and analyzed at the following sampling point and at the sampling frequencies specified for each parameter listed:

Table 3 - Influent Leachate Monitoring
Sampling Point: Leachate Storage Tank

Parameters	Frequency	Parameter	Frequency
CBOD5	Monthly	Chlorides	Quarterly
Total Suspended Solids (TSS)	Monthly	Nitrate as Nitrogen	Quarterly
Total Ammonia as Nitrogen (TAN)	Monthly	Arsenic	Quarterly
Total Phosphorus (TP)	Monthly	Barium	Quarterly
pH	Monthly	Boron	Quarterly
Zinc	Monthly	Chromium	Quarterly
Phenols	Monthly	Copper	Quarterly
Ethylbenzene	Monthly	Iron	Quarterly
		Lead	Quarterly
		Benzo(a)pyrene	Quarterly
		Naphtalene	Quarterly
		Benzene	Quarterly
		Toluene	Quarterly

(3) Effluent samples shall be collected and analyzed at the following sampling point, at the sampling frequencies and using the sample type specified for each parameter listed:

Table 4 - Effluent Monitoring
Sampling Point: Effluent Discharge Pipe
Discharge to Brooks Road Ditch

Parameters	Sample Type	Frequency
CBOD5	Grab	Monthly
Total Suspended Solids (TSS)	Grab	Monthly
Total Ammonia as Nitrogen (TAN)	Grab	Monthly
Total Phosphorus (TP)	Grab	Monthly
pH	Grab	Monthly
Zinc	Grab	Monthly
Phenols	Grab	Monthly
Ethylbenzene	Grab	Monthly
Chlorides	Grab	Quarterly
Nitrate as Nitrogen	Grab	Quarterly
Arsenic	Grab	Quarterly
Barium	Grab	Quarterly
Boron	Grab	Quarterly
Chromium	Grab	Quarterly
Copper	Grab	Quarterly
Iron	Grab	Quarterly
Lead	Grab	Quarterly
Benzo(a)pyrene	Grab	Quarterly
Naphtalene	Grab	Quarterly
Benzene	Grab	Quarterly
Toluene	Grab	Quarterly
Acute Lethality Test (Rainbow Trout and Daphnia magna)	Grab	Quarterly

(4) The methods and protocols for sampling, analysis, toxicity testing, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater Version 2.0" (January 2016), PIBS 2724e02, as amended from time to time by more recently published editions.
(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions, and
(c) the Environment Canada publications "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Rainbow Trout" (EPS 1/RM/13 Second Edition - December 2000)

and "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Daphnia magna" (EPS 1/RM/14 Second Edition - December 2000), as amended from time to time by more recently published editions.

(5) The measurement frequencies specified in subsections (2) and (3) in respect of any parameter are minimum requirements which may, after one (1) year of monitoring in accordance with this Condition, be modified by the District Manager in writing from time to time.

(6) The owner shall install and maintain (a) continuous flow measuring device(s) to measure the flow rate of the effluent discharged from the sewage works, with an accuracy to within plus or minus fifteen (15) per cent of the actual flow rate for the entire design range of the flow measuring device and record the flow rate at a daily frequency..

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

III - STORMWATER MANAGEMENT FACILITY

10. MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following stormwater monitoring program. Stormwater grab samples shall be collected from the Stormwater Management System **(SWMS) Pond** at a **quarterly frequency** (Spring, Summer, Fall, and Winter) and analysed for the following parameters:

Table 5 - Stormwater Monitoring
Sampling Point: **SWMS Pond**

General Parameters	Metals	Field Parameters
Alkalinity	Arsenic	Conductivity
Conductivity	Barium	Dissolved Oxygen
Hardness	Boron	pH
pH	Cadmium	Temperature
Chloride	Chromium	
Sulphate	Copper	
Nitrate as Nitrogen	Iron	
Nitrite as Nitrogen	Lead	
Total Ammonia as Nitrogen (TAN)	Mercury	
Total Suspended Solids	Zinc	
Total Dissolved Solids		
Chemical Oxygen Demand	**Organics**	
Total Phosphorus	Benzo(a)pyrene	
Total Kjeldahl Nitrogen	Ethylbenzene	
Biological Oxygen Demand (BOD5)	Naphthalene	
Phenols		

(2) The methods and protocols for sampling, analysis, toxicity testing, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater Version 2.0" (January 2016), PIBS 2724e02, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions.

11. OPERATION AND MAINTENANCE

(1) The stormwater run-off generated from the active waste fill area shall be considered contaminated and treated as leachate. The Owner shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system.

(2) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(3) The Owner shall prepare an operations manual within six (6) months of Substantial Completion of the Works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works.

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary for operational efficiency and environmental protection of the receiving body.

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works.

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager, and

(e) complaint procedures for receiving and responding to public complaints.

(4) The Owner shall maintain the operations manual current and retain a copy at the location of the Works or operational office of the Owner for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(5) The Owner shall undertake an inspection of the condition of the stormwater management ponds and ditches, at least once a year, and undertake any necessary cleaning and maintenance to prevent the

excessive build-up of sediment and/or decaying vegetation.

(6) The Owner shall undertake an inspection and necessary maintenance of the SWMS pond and associated erosion controls including temporary berms, silt fences, rocks and straw bale check dams at least once a year to ensure that the Works are effectively protecting the environment.

(7) The Owner shall maintain a logbook to record the results of the stormwater management pond inspections and any cleaning and maintenance operations undertaken and shall keep the logbook at the site or operational office of the Owner for inspection by the Ministry.

Stormwater Management System (SWMS)

(8) Before the commencement of operation of the Works, the Owner shall prepare a "Stormwater Contingency and Remedial Action Plan" for the Works and provide a copy to the District Manager.

(9) The Owner shall operate the Works in a **normally open position**. The Owner shall compare monitoring results obtained from the Works under Condition 10(1) with the trigger levels of the selected trigger parameters listed in Table 7 to identify any potential leachate impact to stormwater discharged from the ponds.

Table 7 - Trigger Parameters

Parameter	Trigger Level (mg/L)
Un-ionized Ammonia	0.02
Arsenic	0.005
Boron	1.5
pH (unitless)	6.5 to 8.5

(10) In the event that a monitoring result for any of the parameters listed in Table 7 exceeds its corresponding trigger level concentration, the Owner shall re-sample within two weeks period to confirm the trigger level concentration exceedance for that parameter.

(11) In the event that the trigger level concentration exceedance of any parameter of concern is not confirmed after the second round of sampling conducted under Condition 11(10), then, normal stormwater monitoring shall be resumed.

(12) In the event that the trigger level concentration exceedance of any parameter of concern is confirmed after the second round of sampling conducted under Condition 11(10), the Owner shall operate the Works in a **normally closed position** and notify the District Manager forthwith.

(13) While operating the Works in a **normally closed position**, the Owner shall implement the "Stormwater Contingency and Remedial Action Plan" prepared under Condition 11(8) and collect a grab sample and analyze for the trigger parameters listed under Condition 11(9) at a **weekly frequency** preferably after a rainfall event.

(14) The Owner shall resume operating the Works in a **normally open position** if monitoring results for all

trigger parameters from three (3) consecutive sampling events conducted under Condition 11(13) are less than their respective trigger level concentrations.

(15) Discharge of contaminated stormwater from the Works to storm sewer/surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

IV - GENERAL

12. REPORTING

(1) One week prior to the start up of the operation of the works, the Owner shall notify the District Manager (in writing) of the pending start up date.

(2) The Owner shall report to the District Manager or designate, any exceedance of any parameter specified in Condition 6 orally, as soon as reasonably possible, and in writing within seven (7) days of the exceedance.

(3) In addition to the obligations under Part X of the Environmental Protection Act, the Owner shall, within ten (10) working days of the occurrence of any reportable spill as defined on Ontario Regulation 675/98, bypass or loss of any product, by-product, intermediate product, oil, solvent, waste material or any other polluting substance into the environment, submit a full written report of the occurrence to the District Manager describing the cause and discovery of the spill or loss, clean-up and recovery measures taken, preventative measures to be taken and schedule of implementation.

(4) The Owner shall prepare and submit a performance report to the District Manager on an annual basis by April 30th. The first such report shall cover the first annual period following the commencement of operation of the works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a summary and interpretation of all monitoring data and a comparison to the effluent limits outlined in Condition 6, including an overview of the success and adequacy of the sewage works.

(b) a description of any operating problems encountered and corrective actions taken.

(c) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the sewage works.

(d) a summary of any effluent quality assurance or control measures undertaken in the reporting period.

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment, and

(f) a description of efforts made and results achieved in meeting the effluent objectives outlined in Condition 5.

13. LIMITED OPERATIONAL FLEXIBILITY

(1) The Owner may make modifications to the Works in accordance with the Terms and Conditions of this Approval and subject to the Ministry's "Limited Operational Flexibility Criteria for Modifications to Sewage Works", included under Schedule B of this Approval, as amended.

(2) Sewage works under Limited Operational Flexibility shall adhere to the design guidelines contained within the Ministry's publication "Design Guidelines for Sewage Works 2008", as amended.

(3) The Owner shall ensure at all times, that the Works, related equipment and appurtenances which are installed or used to achieve compliance are operated in accordance with all Terms and Conditions of this Approval.

(4) For greater certainty, the following are not permitted as part of Limited Operational Flexibility:

(a) Modifications to the Works that result in an increase of the approved Rated Capacity of the Works.

(b) Modifications to the Works that may adversely affect the approved effluent quality criteria or the location of the discharge/outfall.

(c) Modifications to the treatment process technology of the Works, or modifications that involve construction of new reactors (tanks) or alter the treatment train process design.

(d) Modifications to the Works approved under s.9 of the EPA, and

(e) Modifications to the Works pursuant to an order issued by the Ministry.

(5) Implementation of Limited Operational Flexibility is not intended to be used for piecemeal measures that result in major alterations or expansions.

(6) If the implementation of Limited Operational Flexibility requires changes to be made to the Emergency Response, Spill Reporting and Contingency Plan, the Owner shall, provide a revised copy of this plan for approval to the local fire services authority prior to implementing Limited Operational Flexibility.

(7) For greater certainty, any modification made under the Limited Operational Flexibility may only be carried out after other legal obligations have been complied with, including those arising from the *Environmental Protection Act, Niagara Escarpment Planning and Development Act, Oak Ridges Moraine Conservation Act, Lake Simcoe Protection Act* and *Greenbelt Act.*

(8) At least thirty (30) days prior to implementing Limited Operational Flexibility, the Owner shall complete a Notice of Modifications describing any proposed modifications to the Works and submit it to the District Manager.

(9) The Owner shall not proceed with implementation of Limited Operational Flexibility until the District Manager has provided written acceptance of the Notice of Modifications or a minimum of thirty (30) days have passed since the day the District Manager acknowledged the receipt of the Notice of Modifications.

Schedule A

1. Application for Approval of Industrial Sewage Works submitted by Mr. Richard Weldon, Managing Partner, 2270386 Ontario Inc., dated September 9, 2019 and supporting information prepared by GHD Consulting Engineers.

2. Letter from GHD to Mr. Paul Widmeyer, Ministry of Environment, Conservation and Parks, Re: Permanent Stormwater Management System ECA No. 4142-ASEKJ2 dated September 17, 2019.

3. Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated September 11, 2013 and design specifications and drawings Prepared by Conestoga-Rovers & Associates Ltd., Waterloo, Ontario.

4. Letter from Peter Kemp, B. Eng., Conestoga-Rovers & Associates Ltd., to Stefanos Habtom, P. Eng., dated May 31, 2014 in response to an additional information request dated April 10, 2014.
5. Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated May 15, 2015 and design specifications and drawings for the leachate treatment system prepared by KOESTER CANADA, Brantford, Ontario.

6. Revised Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated December 15, 2017 but received on January 8, 2018 and revised design specifications and drawings for the leachate treatment system prepared by KOESTER CANADA, Brantford, Ontario.

Schedule B

Limited Operational Flexibility Criteria for Modifications to Industrial Sewage Works

1. The modifications to sewage works approved under an Environmental Compliance Approval (Approval) that are permitted under the Limited Operational Flexibility (LOF), are outlined below and are subject to the LOF conditions in the Approval, and require the submission of the Notice of Modifications. If there is a conflict between the sewage works listed below and the Terms and Conditions in the Approval, the Terms and Conditions in the Approval shall take precedence.

1.1 Sewage Pumping Stations

a. Alter pumping capacity by adding or replacing equipment where new equipment is located within an existing sewage treatment plant site or an existing sewage pumping station site, provided that the modifications do not result in an increase of the sewage treatment plant Rated Capacity and the existing flow process and/or treatment train are maintained, as applicable.

1.2 Sewage Treatment Process

a. Installing additional chemical dosage equipment including replacing with alternative chemicals for pH adjustment or coagulants (non-toxic polymers) provided that there are no modifications of treatment processes or other modifications that may alter the intent of operations and may have negative impacts on the effluent quantity and quality.

b. Expanding the buffer zone between a sanitary sewage lagoon facility or land treatment area and adjacent uses provided that the buffer zone is entirely on the proponent's land.

c. Optimizing existing sanitary sewage lagoons with the purpose to increase efficiency of treatment operations provided that existing sewage treatment plant rated capacity is not exceeded and where no land acquisition is required.

d. Optimizing existing sewage treatment plant equipment with the purpose to increase the efficiency of the existing treatment operations, provided that there are no modifications to the works that result in an increase of the Rated Capacity, and may have adverse effects to the effluent quality or location of the discharge.

e. Replacement, refurbishment of previously approved equipment in whole or in part with Equivalent Equipment, like-for-like of different make and model, provided that the firm capacity, reliability, performance standard, level of quality and redundancy of the group of equipment is kept the same. For clarity purposes, the following equipment can be considered under this provision: screens, grit separators, blowers, aeration equipment, sludge thickeners, dewatering equipment, UV systems, chlorine contact equipment, bio-disks, and sludge digester systems.

1.3 Sewage Treatment Plant Outfall

a. Replacement of discharge pipe with similar pipe size provided that the outfall location is not changed.

1.4 Sanitary Sewers

a. Pipe relining and replacement with similar pipe size within the Sewage Treatment Plant site, where the nominal diameter is not greater than 1,200 mm.

1.5 Pilot Systems

a. Installation of pilot systems for new or existing technologies provided that:

i. any effluent from the pilot system is discharged to the inlet of the sewage treatment plant or hauled off-site for proper disposal,
ii. any effluent from the pilot system discharged to the inlet of the sewage treatment plant or sewage conveyance system does not significantly alter the composition/concentration of the influent sewage to be treated in the downstream process; and that it does not add any inhibiting substances to the downstream process, and
iii. the pilot system's duration does not exceed a maximum of two years; and a report with results is submitted to the Director and District Manager three months after completion of the pilot project.

2. Sewage works that are exempt from section 53 of the OWRA by O. Reg. 525/98 continue to be exempt and are not required to follow the notification process under this Limited Operational Flexibility.

3. Normal or emergency operational modifications, such as repairs, reconstructions, or other improvements that are part of maintenance activities, including cleaning, renovations to existing approved sewage works equipment, provided that the modification is made with Equivalent Equipment, are considered pre-approved.

4. The modifications noted in section (3) above are <u>not</u> required to follow the notification protocols under Limited Operational Flexibility, provided that the number of pieces and description of the equipment as described in the Approval does not change.

Ontario
Ministry of
the Environment

Notice of Modification to Sewage Works

RETAIN COPY OF COMPLETED FORM AS PART OF THE ECA AND SEND A COPY TO THE WATER SUPERVISOR (FOR MUNICIPAL) OR DISTRICT MANAGER (FOR NON-MUNICIPAL SYSTEMS)

Part 1 – Environmental Compliance Approval (ECA) with Limited Operational Flexibility

(Insert the ECA's owner, number, issuance date and notice number, which should start with "01" and consecutive numbers thereafter)

ECA Number	Issuance Date (mm/dd/yy)	Notice number (if applicable)

ECA Owner	Municipality

Part 2: Description of the modifications as part of the Limited Operational Flexibility

(Attach a detailed description of the sewage works)

Description shall include:
1. A detail description of the modifications and/or operations to the sewage works (e.g. sewage work component, location, size, equipment type/model, material, process name, etc.)
2. Confirmation that the anticipated environmental effects are negligible.
3. List of updated versions of, or amendments to, all relevant technical documents that are affected by the modifications as applicable, i.e. submission of documentation is not required, but the listing of updated documents is (design brief, drawings, emergency plan, etc.)

Part 3 – Declaration by Professional Engineer

I hereby declare that I have verified the scope and technical aspects of this modification and confirm that the design:
1. Has been prepared or reviewed by a Professional Engineer who is licensed to practice in the Province of Ontario;
2. Conforms with the Limited Operational Flexibility as per the ECA;
3. Has been designed consistent with Ministry's Design Guidelines, adhering to engineering standards, industry's best management practices, and demonstrating ongoing compliance with s.53 of the Ontario Water Resources Act; and other appropriate regulations.

I hereby declare that to the best of my knowledge, information and belief the information contained in this form is complete and accurate.

Name (Print)	PEO License Number

Signature	Date (mm/dd/yy)

Name of Employer

Part 4 – Declaration by Owner

I hereby declare that:
1. I am authorized by the Owner to complete this Declaration;
2. The Owner consents to the modification; and
3. These modifications to the sewage works are proposed in accordance with the Limited Operational Flexibility as described in the ECA.
4. The Owner has fulfilled all applicable requirements of the *Environmental Assessment Act*.

I hereby declare that to the best of my knowledge, information and belief the information contained in this form is complete and accurate.

Name of Owner Representative (Print)	Owner representative's title (Print)

Owner Representative's Signature	Date (mm/dd/yy)

Notice of Modifications Dec-2013.pdf

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved works and to ensure that subsequent Owners of the works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is imposed to ensure consistency between approvals granted by the Ministry.

4. Conditions 4 and 11 are included to ensure that a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the Owner and made available to the Ministry. Such a manual is an integral part of the operation of the works. Its compilation and use should assist the owner in staff training, in proper plant operation and in identifying and planning for contingencies during possible abnormal conditions. The manual will also act as a benchmark for Ministry staff when reviewing the owner's operation of the works.

5. Condition 5 is imposed to establish non-enforceable effluent quality objectives which the Owner is obligated to use best efforts to strive towards on an ongoing basis. These objectives are to be used as a mechanism to trigger corrective action proactively and voluntarily before environmental impairment occurs and before the compliance limits of Condition 5 are exceeded.

6. Conditions 6 and 7 are imposed to ensure that the effluent discharged from the Works to the Brooks Road side ditch meets the Ministry's effluent quality requirements thus minimizing environmental impact on the receiver.

7. Condition 8 is included to ensure that treatment capacity for the leachate treatment system is established based on proper receiving surface water assimilative capacity assessment and effluent limits requirements.

8. Conditions 9 and 10 are included to require the Owner to demonstrate on a continual basis that the quality and quantity of the effluent from the approved Works is consistent with the (design objectives and) effluent limits specified in the Approval and that the approved works does not cause any impairment to the receiving watercourse.

9. Condition 12 is included to provide a performance record for future references and to ensure that the Ministry is made aware of problems as they arise, so that the Ministry can work with the Owner in resolving the problems in a timely manner.

10. Condition 13 is included to ensure that the Works are operated in accordance with the application and supporting documentation submitted by the Owner, and not in a manner which the Director has not been asked to consider. These Conditions are also included to ensure that a Professional Engineer has reviewed the proposed modifications and attests that the modifications are in line with that of Limited Operational Flexibility, and provide assurance that the proposed modifications comply with the Ministry's requirements stipulated in the Terms and Conditions of this Approval, Ministry policies, guidelines, and industry engineering standards and best management practices.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 4142-ASEKJ2 issued on January 29, 2018.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario

Notice of Modifications Dec-2013.pdf

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL
NUMBER A110302
Issue Date: October 1, 2021

2270386 Ontario Limited
162 Cumberland St
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd North Cayuga
Haldimand County,
N0A 1E0

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act , R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

a waste disposal site (landfill) with a total site area of 14.3 hectares of which 6 hectares is approved for landfilling.

For the purpose of this environmental compliance approval, the following definitions apply:

"Approval" or "ECA" means this Environmental Compliance Approval and any Schedules to it, including the application and supporting documentation listed in Schedule "A";
"Contaminating Life Span" means contaminating life span as defined in Ontario Regulation 232/98;
"Design and Operations Report" means the Design and Operations Report Vertical Expansion – Rev. 1, Brooks Road Landfill Site, Prepared by GHD, June 14, 2021 that was submitted in support of the Approval
"Director" means any Ministry employee appointed in writing by the Minister pursuant to section 5 of the EPA as a Director for the purposes of Part II.1 of the EPA;
"District Manager" means the District Manager of the local district office of the Ministry in which the Site is geographically located;
"EPA" means Environmental Protection Act, R.S.O. 1990, c. E. 19, as amended;
"Improvement Area" means the area of Brooks Road, between Highway #3 (also known as Talbot Road) and Townline Road;
"Ministry" means the Ontario Ministry of the Environment, Conservation and Parks;
"NMA" means Nutrient Management Act, 2002, S.O. 2002, c. 4, as amended;
"Odour Management Plan" means a document which describes the measures to minimize odour emissions from the Site;
"Operator" means any person, other than the Owner's employees, authorized by the

Owner as having the charge, management or control of any aspect of the Site and includes its successors or assigns;
"Owner" means any person that is responsible for the establishment or operation of the Site being approved by this Approval, and includes 2270386 Ontario Limited and its successors and assigns;
“OWRA” means the Ontario Water Resources Act, R.S.O. 1990, c. O.40, as amended;
“PA” means the Pesticides Act, R.S.O. 1990, c. P-11, as amended;
"Provincial Officer" means any person designated in writing by the Minister as a provincial officer pursuant to Section 5 of the OWRA, Section 5 of the EPA, Section 17 of the PA, Section 4 of the NMA, or Section 8 of the SDWA;
"Refrigerant Appliances" means household appliances which use, or may use refrigerants, and which include, but is not restricted to, refrigerators, freezers and air-conditioning systems;
"Regional Director" means the Regional Director of the local Regional Office of the Ministry in which the Site is located;
"Regulation 232" means Ontario Regulation 232/98 - Landfilling Sites made under the EPA, as amended;
"Regulation 347" or "Reg. 347" means means Regulation 347, R.R.O. 1990, General - Waste Management, made under the EPA, as amended;
"Regulation 406" means means Regulation 406/19, R.S.O. 1990, On-site and Excess Soil Management, made under the EPA, as amended;
"Regulation 558" means Ontario Regulation 558/00 - General Waste Management, made under the EPA, as amended;
"Regulation 903" means Regulation 903 - Wells, R.R.O. 1990, made under the OWRA, as amended;
"SDWA" means Safe Drinking Water Act, 2002, S.O. 2002, c. 32, as amended;
“Site" means the entire waste disposal site, including the buffer lands, at the Brooks Road Landfill Site, Lot 24, Concession 1 North, Haldimand County; and
“Trained Personnel” means personnel knowledgeable in the following through instruction and/or practice:
a. relevant waste management legislation, regulations and guidelines;
b. major environmental concerns pertaining to the waste to be handled;
c. occupational health and safety concerns pertaining to the processes and wastes to be handled;
d. management procedures including the use and operation of equipment for the processes and wastes to be handled;
e. emergency response procedures;
f. specific written procedures for the control of nuisance conditions;
g. specific written procedures for refusal of unacceptable waste loads; and
h. the requirements of this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. GENERAL

Compliance

(1) This Approval revokes all previous Approvals and Notices of Amendment issued under Part V of the Environmental Protection Act for this Site. The approval given herein, including the terms and conditions set out, replaces all previously issued Approvals and related terms and conditions under Part V of the Act for this Site.
(2) The Owner and Operator shall ensure compliance with all the conditions of this Approval and shall ensure that any person authorized to carry out work on or operate any aspect of the Site is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.
(3) Any person authorized to carry out work on or operate any aspect of the Site shall comply with the conditions of this Approval.

In Accordance

(4) Except as otherwise provided by this Approval, the Site shall be designed, developed, built, operated and maintained in accordance with the documentation listed in the attached Schedule “A”.
(5) 1. Construction and installation of aspects described in Schedule "A" must be completed within 5 years of the later of:
(a) the date this Approval is issued; or
(b) if there is a hearing or other litigation in respect of the issuance of this Approval, the date that this hearing or litigation is disposed of, including all appeals.
2. This Approval ceases to apply in respect of the aspects of the Site noted above that have not been constructed or installed before the later of the dates identified in Condition 1(5)1.

Interpretation

(6) Where there is a conflict between a provision of any document listed in Schedule "A" in this Approval, and the conditions of this Approval, the conditions in this Approval shall take precedence.
(7) Where there is a conflict between the application and a provision in any document listed in Schedule "A", the application shall take precedence, unless it is clear that the purpose of the document was to amend the application and the Ministry approved the amendment.
(8) Where there is a conflict between any two documents listed in Schedule "A", the document bearing the most recent date shall take precedence.
(9) The conditions of this Approval are severable. If any condition of this Approval, or the application of any condition of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

Other Legal Obligations

(10) The issuance of, and compliance with, this Approval does not:
(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement; and

(b) limit in any way the authority of the Ministry to require certain steps be taken or to require the Owner and Operator to furnish any further information related to compliance with this Approval.

Adverse Effect

(11) The Owner and Operator shall take steps to minimize and ameliorate any adverse effect on the natural environment or impairment of water quality resulting from the present, past and historical operations at the Site. Such steps may include accelerated or additional monitoring as may be necessary to determine the nature and extent of the effect or impairment.

(12) Despite an Owner, Operator, or any other person fulfilling any obligations imposed by this Approval, the person remains responsible for any contravention of any other condition of this Approval or any applicable statute, regulation, or other legal requirement resulting from any act or omission that caused the adverse effect to the natural environment or impairment of water quality.

(13) At no time shall the Owner or Operator allow the discharge of a contaminant that causes or is likely to cause an adverse effect.

Change of Ownership

(14) The Owner shall notify the Director, in writing, and forward a copy of the notification to the District Manager, within 30 days of the occurrence of any changes in the following information:

(a) the ownership of the Site;

(b) the Operator of the Site;

(c) the address of the Owner or Operator; and

(d) the partners, where the Owner or Operator is or at any time becomes a partnership and a copy of the most recent declaration filed under the Business Names Act, R. S. O. 1990, c. B.17, shall be included in the notification.

(15) No portion of this Site shall be transferred or encumbered prior to or after closing of the Site unless the Director is notified in advance and sufficient financial assurance is deposited with the Ministry to ensure that these conditions will be carried out.

(16) In the event of any change in ownership of the Site, other than change to a successor municipality, the Owner shall notify the successor of and provide the successor with a copy of this Approval, and the Owner shall provide a copy of the notification to the District Manager and the Director.

Registration on Title Requirement

(17) Prior to dealing with the property in any way, the Owner shall provide a copy of this Approval and any amendments, to any person who acquires an interest in the property as a result of the dealing.

(18) (a) If not already completed, within ninety (90) calendar days from the date of issuance of this Approval, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:

(i) a plan of survey prepared, signed and sealed by an Ontario Land Surveyor, which shows the area of the Site where waste has been and is to

be deposited at the Site;
(ii) proof of ownership of the Site;
(iii) a letter signed by a member of the Law Society of Upper Canada or other qualified legal practitioner acceptable to the Director, verifying the legal description provided in the Certificate of Requirement;
(iv) the legal abstract of the property; and
(v) any supporting documents including a registerable description of the Site.

(b) If not already completed, within fifteen (15) calendar days of receiving a Certificate of Requirement authorized by the Director, the Owner shall:

(i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and
(ii) submit to the Director and the District Manager, written verification that the Certificate of Requirement has been registered on title.

Registration on Title Requirement - Contaminant Attenuation Zone (CAZ)
(19) Within thirty (30) calendar days from the date of establishing a contaminant attenuation zone (CAZ) (overburden and/or bedrock aquifers) in either fee simple or by way of a groundwater easement, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:
(a) If rights are obtained in fee simple, the Owner shall provide:

(i) documentation evidencing ownership of the CAZ obtained in compliance with Regulation 232, as amended;
(ii) a completed Certificate of Requirement and supporting documents containing a registerable description of the CAZ; and
(iii) a letter signed by a member of the Law Society of Upper Canada; or other qualified legal practitioner acceptable to the Director, verifying the legal description of the CAZ.

(b) within fifteen (15) calendar days of receiving a Certificate of Requirement signed or authorized by the Director,the Owner shall:

(i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and
(ii) submit to the Director and the District Manager, a written verification that the Certificate of Requirement has been registered on title.

(c) If rights are obtained by way of a groundwater easement, the Applicant shall:

(i) provide a copy of the agreement for the easement;
(ii) provide a plan of survey signed and sealed by an Ontario Land Surveyor

for the CAZ; and
(iii) submit proof of registration on title of the groundwater easement to the Director and District Manager;

(d) The Owner shall not amend, or remove, or consent to the removal of the easement or CAZ from title without the prior written consent of the Director.

Inspections by the Ministry

(20) No person shall hinder or obstruct a Provincial Officer from carrying out any and all inspections authorized by the OWRA, the EPA, the PA, the SDWA or the NMA, of any place to which this Approval relates, and without limiting the foregoing:
(a) to enter upon the premises where the approved works are located, or the location where the records required by the conditions of this Approval are kept;
(b) to have access to, inspect, and copy any records required to be kept by the conditions of this Approval;
(c) to inspect the Site, related equipment and appurtenances;
(d) to inspect the practices, procedures, or operations required by the conditions of this Approval; and
(e) to sample and monitor for the purposes of assessing compliance with the terms and conditions of this Approval or the EPA, the OWRA, the PA, the SDWA or the NMA.

Information and Record Retention

(21) (a) Except as authorized in writing by the Director, all records required by this Approval shall be retained at the Site for a minimum of two (2) years from their date of creation.
(b) The Owner shall retain all documentation listed in Schedule “A” for as long as this Approval is valid.
(c) All information and logs required in Conditions 9(1), 10(1), 11(3), 11(4), 12(3), and 12(4) shall be kept at the Site until they are included in the Annual Report.
(d) The Owner shall retain employee training records as long as the employee is working at the Site.
(e) The Owner shall make all of the above documents available for inspection upon request of Ministry staff.
(22) The receipt of any information by the Ministry or the failure of the Ministry to prosecute any person or to require any person to take any action under this Approval or under any statute, regulation or other legal requirement, in relation to the information, shall not be construed as:
(a) an approval, waiver, or justification by the Ministry of any act or omission of any person that contravenes any term or condition of this Approval or any statute, regulation or other legal requirement; or
(b) acceptance by the Ministry of the information’s completeness or accuracy.
(23) The Owner shall ensure that a copy of this Approval, in its entirety and including all its Notices of Amendment, and documentation listed in Schedule "A", are retained at the Site at all times.
(24) Any information related to this Approval and contained in Ministry files may be

made available to the public in accordance with the provisions of the Freedom of Information and Protection of Privacy Act, RSO 1990, CF-31.

2. FINANCIAL ASSURANCE

(1) (a) Within twenty (20) days of issuance of this Notice, the Owner shall submit to the Director, Financial Assurance as defined in Section 131 of the Environmental Protection Act, in the amount of **$8,371,282.00.** This Financial Assurance shall provide sufficient funds for the closure and post-closure care/monitoring of the Site.

(i) The total amount of financial assurance specified in Condition 2(1)(a) shall be updated by the Owner, as follows, by the specified dates:

i. October 1, 2021 - **$9,956,333.00**
ii. October 1, 2022 - **$11,541,383.00**
iii. October 1, 2023 - **$10,424,285.00**
iv. October 1, 2024 - **$10,097,075.00**

(b) Commencing on October 1, 2023 and on a three (3) year basis thereafter, the Owner shall provide to the Director a re-evaluation of the amount of the Financial Assurance to facilitate the actions required under Condition 2(1)(a). The re-evaluation shall include an assessment based on any new information relating to the environmental conditions of the Site and shall include the costs of additional monitoring and/or implementation of alternative measures required by the Director upon review of the annual reports. The Financial Assurance must be submitted to the Director within twenty (20) days of written acceptance of the re-evaluation by the Director;

(c) The amount of Financial Assurance is subject to review at any time by the Director and may be amended at his/her discretion. If any Financial Assurance is scheduled to expire or notice is received, indicating Financial Assurance will not be renewed, and satisfactory methods have not been made to replace the Financial Assurance at least sixty (60) days before the Financial Assurance terminates, the Owner shall forthwith replace the Financial Assurance with cash.

3. SITE OPERATION

Operation

(1) The Site shall be operated and maintained at all times including management and disposal of all waste, in accordance with the EPA, Regulation 347, Regulation 232, and the conditions of this Approval.

Service Area

(2) Waste categories of Industrial, Commercial and Institutional ("ICI waste"), generated from within the geographic boundaries of the Province of Ontario may be received for disposal at this Site.

Waste Types

(3) Only solid non-hazardous ICI waste, including contaminated soils, and processed

organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant), shall be received for disposal at this Site. No hazardous waste or liquid industrial waste , as defined in Reg. 347, as amended by Reg. 558/00, shall be disposed at this Site.
(4) The Owner shall develop and implement a program to inspect waste to ensure that the waste received at the Site is of a type approved for acceptance under this Approval.
(5) The Owner shall ensure that all loads of waste are properly inspected by Trained Personnel prior to acceptance at the Site and that the waste vehicles are directed to the appropriate areas for disposal or transfer of the waste. The Owner shall notify the District Manager, in writing, of load rejections at the Site within one (1) business day from their occurrence.

Approved Waste Quantities

(6) The maximum volumetric capacity for the Site including waste and daily cover shall not exceed 1,045,065 cubic metres.
(7) The Owner shall ensure that the waste received at the Site does not exceed:
(a) a total of 250,000 tonnes in any calendar year; and
(b) the daily maximum received at the site does not exceed 1,000 tonnes.

Waste Placement

(8) No waste shall be landfilled outside of the approved six (6) hectare footprint fill area. The site shall be developed, maintain established buffer areas, and adhere to final contours for waste and final cover material in accordance with the design drawings provided in Appendix L of the Design and Operations Report.
(a) The maximum elevation of the fill zone, including final cover, shall be 221.50 metres above mean sea level.

Signage

(9) A sign shall be installed and maintained at the main entrance/exit to the Site on which is legibly displayed the following information:
(a) the name of the Site and Owner;
(b) the number of the Approval;
(c) the name of the Operator;
(d) the normal hours of operation;
(e) the allowable and prohibited waste types;
(f) the telephone number to which complaints may be directed;
(g) a warning against unauthorized access;
(h) a twenty-four (24) hour emergency telephone number (if different from above); and
(i) a warning against dumping outside the Site.
(10) All landfill signs shall be kept legible, in good repair, and cleaned when required.

Nuisance Control (Vermin, Vectors, Dust, Litter, Odour, Noise and Traffic)

(11) The Site shall be operated and maintained such that vermin, vectors, dust, litter, odour, noise and traffic do not create a nuisance.
(12) The Owner/Operator shall install visual screening berms, in accordance with the Design and Operations Report and shall inspect and maintain them as required, during the operating life of the landfill Site.

(13) The Owner/Operator shall conduct inspections and ensure that appropriate controls are in place to prevent the acceptance of liquid industrial waste and hazardous waste and to prevent the acceptance of waste from outside the approved service area. Records of violations by haulers or waste generators shall be maintained in the daily records for the Site operations. The Owner/Operator shall ensure that any waste refused for disposal leaves the Site immediately, and the District Manager is notified forthwith, of all waste load refusals at the Site related to requirements in this Certificate, including service area and waste types.
(14) The Owner/Operator shall ensure that the leachate collection system piping in the fill area and the connecting forcemain piping which leads to the leachate holding tank, shall be cleaned out at least once per year with a high pressure wash, and video inspections conducted, as necessary, to confirm that the pipes are clean and to determine the need for more frequent cleaning. Assessment of the need to amend the cleaning frequency shall be based on regular inspections of the leachate collection system and monitoring results.
(15) A thickness of at least 5 metres of compacted waste and cover material shall be maintained between any landfilled sludge (solid non-hazardous as per Reg. 347) and the granular leachate collection layer and leachate monitoring wells.
(16) The Owner/Operator shall take all reasonable steps to prevent off-site nuisance impacts, including visual impacts, transfer of waste, mud, or dust from the Site onto public roads due to landfill operations.

Burning of Waste

(17) Burning of waste at the Site is prohibited.

Scavenging

(18) Scavenging (as defined in Reg. 347) of deposited and/or stockpiled waste is prohibited at the Site. Controlled removal of recycleable/reusable material from the Site may only occur in a designated paved area on the Site, and shall be supervised by Trained Personnel.

Hours of Operation

(19) The permitted hours of operation for the site are from 6:00 a.m. to 6:00 p.m., Monday to Friday, and from 6:00 a.m. to 2:00 p.m. on Saturdays, for site preparation, site maintenance and daily cover activities. The operating hours for receipt of waste for disposal at the Site shall be from 7:00 a.m. to 5:00 p.m., Monday to Friday, and from 7:00 a.m. to 1:00 p.m., on Saturdays. No operations shall take place at the Site outside of the stated hours and the Site shall be closed on statutory holidays.
(20) The hours of operation may be amended from time to time to accommodate seasonal or unusual demand, based on prior consultation with the PLC and written concurrence from the District Manager.

Site Security

(21) No waste shall be received, landfilled or removed from the Site unless a site supervisor or other Trained Personnel are present to supervise the operations during operating hours. The Site shall be closed when a supervisor or Trained Personnel are not present to supervise operations at the Site.

(22) The Site shall be operated and maintained in a safe and secure manner. During non-operating hours, the Site entrance and exit gates shall be locked and the Site shall be secured against access by unauthorized persons.

Cover Material

(23) Alternative materials to soil may be used as weekly and interim cover material, based on an application with supporting information and applicable fee for a trial use or permanent use, submitted by the Owner to the Director, copied to the District Manager and as approved by the Director via an amendment to this Approval. The alternative material shall be non-hazardous according to Regulation 347 and will be expected to perform at least as well as soil in relation to the following functions:

(a) control of blowing litter, odours, dust, landfill gas, gulls, vectors, vermin and fires;

(b) provision for an aesthetic condition of the landfill during the active life of the Site;

(c) provision for vehicle access to the active tipping face; and

(d) compatibility with the design of the Site for groundwater protection, leachate management and landfill gas management.

(24) Daily, interim and final cover material shall be shall be applied as follows:

a. Daily Cover - At the end of each working day, the entire working face shall be compacted and covered with a minimum thickness of 150 mm of soil cover, compost, wood chips, or other approved daily cover material. Prior to placing waste at the start of the next operating day, the existing daily cover material shall be scarified or removed to the extent practical, to ensure vertical hydraulic connection is maintained between layers of waste and to promote percolation of leachate downwards to the leachate collection system.

b. Interim Cover - In areas where landfilling ceases temporarily for a period of 6 months or more, a minimum thickness of 300 mm of soil shall be placed as interim cover and graded to promote surface water runoff. The quality of soil for use as interim cover shall, as a minimum, meet the standards specified in Table 3 of Soil, Groundwater and Sediment Standards for use under Part XV.1 of the Environmental Protection Act. Prior to the use of interim cover soil, representative samples shall be taken and analysed for metals, Volatile Organic Compounds (VOCs) and PAHs, to confirm the soil meets the above-mentioned standards.

c. Final Cover - Final cover shall be applied progressively as areas of the landfill reach final waste elevations within the fill area. Prior to placement of final cover, the Owner/Operator shall submit for the approval of the Director, a report detailing the specifications, including particle size distribution of the final cover soil which shall confirm the designed infiltration rate of 0.15 m/year, as well as the protocols for testing and acceptance for on-site and off-site final cover soils. All areas of final cover shall be graded and vegetated as soon as practically possible. The final soil cap shall be regularly inspected and maintained after the installation and during the post-closure period. Without limiting the above, the Owner/Operator shall ensure for a minimum of five years after completion of the cap that the Site shall be inspected at least on a quarterly basis to ensure that there is positive drainage along the cap and that during the frost free period of the first two years following completion, such inspections shall

be monthly. If any inspection indicates that there is an area of ponding or zero slope, the Owner/Operator shall take all steps necessary to provide positive drainage and rehabilitate the final cover as soon as practically possible.
d. All on-site and excess soil used for daily, interim, and final cover shall be managed in accordance with Regulation 406.

Traffic Control

(25) The Owner/Operator shall ensure that vehicles carrying waste or materials to and from the Site shall only enter the Site from Highway #3 and Brooks Road. At no time shall any vehicle carrying waste or materials to and from the Site travel along Townline Road to access the Site.
(26) The Owner/Operator shall be responsible for maintenance and remedial work to the Improvement Area. The Improvement Area shall be maintained to the following minimum requirements:
(a) 300 mm thick granular "A" layer of gravel, meeting all applicable Haldimand County and Ontario Provincial Standards Specification (OPSS) to the Improvement Area; and
(b) Maintain asphalt on the entranceway/exit to the landfill and the parking area for the landfill Site, as well as 30 metres of the road approach on Brooks Road to the entranceway/exit to the Site, extending both north and south of the entranceway/exit, in base asphalt and top coat. The thickness of asphalt shall be a base coarse of 60 mm (HL8), and a surface coarse of 50 mm (HL3).

4. GROUNDWATER AND SURFACE WATER MONITORING

Compliance

(1) The Site shall be operated in such a way as to ensure compliance with the following:
(a) Reasonable Use Guideline B-7 for the protection of the groundwater at the Site; and
(b) Provincial Water Quality Objectives included in the July 1994 publication entitled Water Management Policies, Guidelines, Provincial Water Quality Objectives, as amended from time to time, or limits set by the Regional Director, or the Canadian Water Quality Guidelines published by the Canadian Council of Ministers of the Environment, 1999 for the protection of the surface water at and off the Site.

Surface Water and Groundwater

(2) The Owner shall monitor surface water and groundwater in accordance with the environmental monitoring program outlined in Schedule "B".
(3) A certified Professional Geoscientist or Engineer possessing appropriate hydrogeologic and hydrologic training and experience shall execute or directly supervise the execution of the environmental monitoring and reporting program.

Groundwater Wells and Monitors

(4) The Owner shall ensure that all groundwater monitoring wells which form part of the monitoring program are properly capped, locked and protected from damage and maintained in accordance with Regulation 903.
(5) Where landfilling is to proceed around monitoring wells, suitable extensions shall be added to the wells and the wells shall be properly re-secured.
(6) Any groundwater monitoring well included in the on-going monitoring program that

is damaged shall be assessed, repaired, replaced or decommissioned by the Owner, as required.

(a) The Owner shall repair or replace any monitoring well which is destroyed or in any way made to be inoperable for sampling such that no more than one regular sampling event is missed.

(b) All monitoring wells which are no longer required as part of the groundwater monitoring program, and have been approved by the Director or the District Manager for abandonment, shall be decommissioned by the Owner, as required, in accordance with Regulation 903, to prevent contamination through the abandoned well. A report on the decommissioning of the well shall be included in the Annual Report for the period during which the well was decommissioned.

Trigger Mechanisms and Contingency Plans

(7) In the event of a confirmed exceedance of a site-specific trigger level relating to groundwater or surface water impacts due to leachate, the Owner shall immediately notify the District Manager, and an investigation into the cause and the need for implementation of remedial or contingency actions shall be carried out by the Owner in accordance with the approved trigger mechanisms and associated contingency plans provided in Appendix J of the Design and Operations Report.

(8) If monitoring results, investigative activities and/or trigger mechanisms indicate the need to implement contingency measures, the Owner shall ensure that the following steps are taken:

(a) the Owner shall notify the District Manager, in writing of the need to implement contingency measures, no later than seven (7) days after confirmation of the exceedances;

(b) within thirty (30) days from the date of confirming the need to implement contingency measures, detailed plans, specifications and descriptions for the design, operation and maintenance of the contingency measures shall be prepared and submitted by the Owner to the Director for approval; and

(c) the contingency measures shall be implemented by the Owner upon approval by the Director.

(9) The Owner shall ensure that any proposed changes to the site-specific trigger levels for leachate impacts to surface water or groundwater, are approved in advance by the Director via an amendment to this Approval.

Changes to the Monitoring Plan, Trigger Mechanism and Contingency Plan

(10) The Owner may request to make changes to the environmental monitoring program, Trigger Mechanism and Contingency Plan to the District Manager in accordance with the recommendations of the annual report. The Owner shall make clear reference to the proposed changes in a separate letter that shall accompany the annual report.

(11) Within fourteen (14) days of receiving the written correspondence from the District Manager confirming that the District Manager is in agreement with the proposed changes to the environmental monitoring program, the Owner shall forward a letter

identifying the proposed changes and a copy of the correspondences from the District Manager and all other correspondences and responses related to the changes to the monitoring program, to the Director requesting the Approval be amended to approve the proposed changes to the environmental monitoring plan prior to implementation.

(12) In the event any other changes to the environmental monitoring program are proposed outside of the recommendation of the annual report, the Owner shall follow current Ministry procedures for seeking approval for amending the Approval.

5. LEACHATE MANAGEMENT AND DISPOSAL

(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site Leachate Treatment System, in accordance with the terms and conditions of the Industrial Sewage Works Approval No. 1122-BKUPSM dated February 3, 2020, as amended.

(a) Notwithstanding Condition 5(1), leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.

(2) Leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall not be discharged to the natural environment at any time.

(3) Any alternative proposal for leachate management and disposal must receive prior written approval of the District Manager.

(4) The Owner shall reduce the level of leachate within the landfill to an elevation 191 metres above mean sea level (AMSL), which equates to an average leachate depth of no greater than 0.3 metres, by the earlier of:

(a) five (5) years from the issuance date of this ECA; or

(b) the date the landfill reaches capacity.

(5) In addition to the requirements of Condition 5(4), the interim annual leachate elevation levels and interim landfill capacity-based leachate elevations shall be adhered to pursuant to Schedules "C" and "D" respectively.

(a) The leachate elevation, as determined by the pressure transducer located in the leachate collection sump riser pipe shall be used to establish the landfill leachate elevation. The leachate elevation will be considered in compliance with the target leachate elevations if the measurement meets the elevations stated in Schedules "C" and "D" within fifteen (15) days of the compliance date.

(6) The Owner shall implement the leachate management contingency measures in the report titled "Leachate Removal Plan – Revision 2, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited", prepared June 1, 2021, as amended, as necessary to meet the leachate elevations in Schedules "C" and "D".

(a) if the leachate elevations in Schedules "C" and "D" are not met within 105 days of the anniversary date of the issuance of this Approval the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below the leachate elevation in Schedules "C" and "D":

(i) notify the District Manager;
(ii) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site;
(iii) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site;
(iv) install interim cover to cells that have not reached final waste contours and to the working face;
(v) install final cover to cells that have reached final waste contours;
(vi) establish vegetation on installed cover material where appropriate and weather permitting; and
(vii) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.

(b) landfilling activities may commence again when the compliance leachate elevation has been attained; and
(c) prior to amending the Leachate Removal Plan proposed amendments shall be submitted to the District Manager for approval.
(7) If the leachate elevation in the landfill reaches 199.0 metres AMSL, the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below 199.0 metres AMSL:
(a) notify the District Manager;
(b) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site;
(c) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site;
(d) install interim cover to cells that have not reached final waste contours and to the working face;
(e) install final cover to cells that have reached final waste contours;
(f) establish vegetation on installed cover material where appropriate and weather permitting; and
(g) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.
(8) The Owner shall monitor leachate in accordance with the monitoring program outlined in Schedule "B".

6. LANDFILL GAS MANAGEMENT

(1) The Owner/Operator shall ensure that all buildings and structures containing enclosed spaces at the Site, shall be situated, constructed and monitored in a manner which minimizes the potential for explosive hazards due to landfill gas. The Owner/Operator shall install and maintain in good working condition, methane detection

and alarm equipment (with active venting or with an effective passive venting system to relieve any possible landfill gas accumulation) for all enclosed buildings at the Site.
(2) The Owner/Operator shall ensure that site design plans, specifications and descriptions for the control of landfill gas are such that the subsurface migration of landfill gas meets the requirements of the Ministry's Landfill Standards Guideline, Section 4.10, including but not limited to the following:
(a) the concentration of methane gas below the ground surface at the Site boundary must be less than 2.5 per cent by volume;
(b) the concentration of methane gas in any on-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, if the building or structure is accessible to any person or contains electrical equipment or a potential source of ignition, must be less than 1.0 per cent by volume;
(c) sub-condition (b) does not apply to a leachate collection, storage or treatment facility or a landfill gas collection or treatment facility for which specific health and safety measures and procedures are in place relating to the risk of asphyxiation and the risk of explosion; and
(d) the concentration of methane gas from the Site in any off-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, must be less than 0.05 per cent by volume (i.e. not present).
(3) If the measured gas concentration at a gas probe exceeds the applicable limit listed in Condition 6(2) above, the District Manager shall be notified immediately. The gas concentrations shall be re-measured immediately and daily for a period of up to three
(3) consecutive days. If these readings confirm that the applicable limit has been exceeded, the Owner/Operator shall forthwith, implement appropriate control measures.
(4) The Owner shall monitor landfill gas in accordance with the monitoring program outlined in Schedule "B".

7. STORMWATER MANAGEMENT

(1) Stormwater runoff generated from the active waste fill area shall be treated by the Owner/Operator as leachate. The Owner/Operator shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system. If necessary, granular sumps shall be dug into the waste to facilitate drainage of contaminated stormwater towards the leachate collection system.
(2) The Owner shall monitor the stormwater management pond in accordance with the monitoring program outlined in Schedule "B".

8. EMPLOYEE TRAINING

(1) A training plan for all employees that operate any aspect of the Site shall be developed and implemented by the Owner or the Operator. Only Trained Personnel shall operate any aspect of the Site or carry out any activity required under this Approval.
(2) The Owner shall ensure that all site operations employees have been adequately trained and received on-going training with respect to the following, but not limited to:
(a) terms, conditions and operating requirements of this Approval for the Site;

(b) the operation, inspection, and maintenance of the Site with respect to the approved design and operations documents;
(c) relevant waste management legislation and regulations;
(d) environmental concerns related to waste management at the Site;
(e) occupational Health and Safety concerns related to waste management at the Site; and
(f) emergency procedures and contingency plans in case of fire, spills, off-site impacts and any other emergency situations.

9. COMPLAINTS RESPONSE PROCEDURE

(1) If at any time the Owner receives complaints regarding the operation of the Site, the Owner shall respond to these complaints according to the following procedure:
(a) The Owner shall record and number each complaint, either electronically or in a log book, and shall include the following information: the nature of the complaint, the name, address and the telephone number of the complainant if the complainant will provide this information and the time and date of the complaint;
(b) The Owner, upon notification of the complaint, shall initiate appropriate steps to determine possible causes of the complaint, proceed to take the necessary actions to eliminate the cause of the complaint and forward a written reply to the complainant; and
(c) The Owner shall complete and retain on-site a report written within one (1) week of the complaint date, listing the actions taken to resolve the complaint and recommendations, if any, for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents.

10. EMERGENCY AND SPILL RESPONSE

(1) All Spills as defined in the EPA occurring at or from the Site shall be immediately reported to the **Ministry's Spills Action Centre at 1-800-268-6060** and shall be recorded in the log book. The Owner/Operator shall record for each Spill event the contaminant(s) spilled, the quantity or volume of contaminants spilled, the spatial distribution of the area impacted by the Spill, a root cause analysis of the events leading up to the Spill and a list of actions designed to prevent similar Spill events.
(2) In addition, the Owner shall submit, to the District Manager a written report within three (3) business days of the Spill event, outlining the nature of the incident, remedial measures taken, handling of waste generated as a result of the emergency situation and the measures taken to prevent future occurrences at the Site.
(3) All wastes resulting from a Spill event shall be managed and disposed of in accordance with the EPA and Regulation 347.
(4) All equipment and materials required to handle the Spill event shall be:
(a) kept on hand at all times that waste landfilling and/or handling is undertaken at the Site; and
(b) adequately maintained and kept in good repair.
(5) The Owner shall ensure that the emergency response personnel are familiar with the use of such equipment and its location(s).

11. PUBLIC LIAISON COMMITTEE (PLC)

(1) The Owner or Operator shall maintain and participate in a landfill PLC, which shall

function in accordance with the Terms of Reference for the PLC, as amended from time to time. Any amendment to the Terms of Reference must be approved by the District Manager. The PLC shall serve as a forum for dissemination, consultation, review and exchange of information regarding the operation of the landfill Site, including environmental monitoring, maintenance, complaint resolution, and new approvals or amendments to existing approvals related to the operation of this landfill Site.
(2) The Owner/Operator shall invite representation from the following groups to participate on the PLC:
(a) the County of Haldimand;
(b) Six Nations of the Grand River;
(c) landowners within a minimum 500 metre distance of the Site;
(d) residents of Haldimand County; and
(e) Lower Grand River Land Trust.
The number of representatives from each group shall be as specified in the Terms of Reference approved by the District Manager.
(3) Copies of all reports or other submissions required by the conditions of this Approval shall be made available to the PLC and the County of Haldimand, in accordance with the deadlines specified in the Conditions.
(4) The Owner or Operator shall provide to the PLC and the County of Haldimand, reasonable notice and opportunities to make comments regarding any proposed amendment to this Approval. The Owner or Operator shall forward to the Director for consideration any written comments received by the Owner or Operator and advise the Director of the essence of any verbal comments received by the Owner or Operator regarding the proposed amendment.

12. INSPECTIONS, RECORD KEEPING AND REPORTING

Daily Inspections and Inspection Log

(1) A visual inspection of the entire Site and all equipment on the Site shall be conducted each day the Site is open to ensure that:
(a) the Site is secure;
(b) the operation of the Site is not causing any nuisances;
(c) the operation of the Site is not causing any adverse effects on the environment or impairing water quality; and
(d) the Site is being operated in compliance with this Approval.
(2) Any deficiencies discovered as a result of the inspection shall be remedied immediately, including temporarily ceasing operations at the Site if needed **.**
(3) An electronic or written record of the inspections shall be maintained and shall include the following:
(a) the name and signature of person that conducted the inspection;
(b) the date and time of the inspection;
(c) the list of all deficiencies discovered during the inspections, including but not limited to:

(i) the presence of any leachate seeps;
(ii) the condition of the methane venting system;
(iii) poor drainage conditions and ponding of surface water; and
(iv) the presence of waste outside of the approved fill area;

(d) the recommendations for remedial action to address the identified deficiencies; and
(e) the date, time and description of the remedial actions taken.

Daily Waste Log

(4) A daily log shall be maintained in written or electronic format and shall include the following information:
(a) the type, date and estimated quantity (tonnes) of all waste, including non-landfilled waste received at the Site;
(b) the type, date and estimated quantity (tonnes) of cover material applied at the Site;
(c) the area of the Site in which waste disposal operations are taking place;
(d) a record of litter collection activities and the application of any dust suppressants;
(e) a record of all refusals of waste shipments, the reason(s) for refusal, and the origin of the waste, if known; and
(f) a description of any out-of-service period of any control, treatment, disposal or monitoring facilities, the reasons for the loss of service, and action taken to restore and maintain service.

Other Information

(5) Any information requested, by the Director, the District Manager or a Provincial Officer, concerning the Site and its operation under this Approval, including but not limited to any records required to be kept by this Approval shall be provided to the Ministry, upon request.

Annual Report

(6) A written report on the development, operation and monitoring of the Site, shall be completed annually (the “Annual Report”). The Annual Report shall be submitted to the District Manager, by March 31st of the year following the period being reported upon.
(7) The Annual Report shall include but not be limited to the following information:
(a) the results and an interpretive analysis of the results of all leachate, groundwater surface water and landfill gas monitoring, including an assessment of the need to amend the monitoring programs;
(b) an assessment on the Site’s compliance with Guideline B7;
(c) an assessment of the operation and performance of all engineered facilities, the need to amend the design or operation of the Site, and the adequacy of and need to implement the Ministry approved contingency plans;
(d) site plans showing the existing contours of the Site; areas of landfilling operation during the reporting period; areas of intended operation during the next reporting period; areas of excavation during the reporting period; the progress of final cover, vegetative cover, and any intermediate cover application; facilities existing, added or

removed during the reporting period; and site preparations and facilities planned for installation during the next reporting period;
(e) summaries of any actions taken for the odour management plan and compliance with the leachate removal plan;
(f) summaries of any actions taken for the compliance with the leachate removal plan;
(g) calculations of the volume of waste, daily and intermediate cover, and final cover deposited or placed at the Site during the reporting period and a calculation of the total volume of Site capacity used during the reporting period;
(h) a calculation of the remaining capacity of the Site or an estimate of the remaining Site life;
(i) summary of total annual quantity (tonnes) of waste received at the Site;
(j) a summary of any complaints received and the responses made;
(k) a summary of the information included in the logs required by Conditions 9(1), 10(1), 11(3), 11(4), 11(5), and 12(2);
(l) a summary of the daily waste log;
(m) a discussion of any operational problems encountered at the Site and corrective action taken;
(n) any changes to the Ministry approved Design and Operations Report and the Closure Plan that have been approved by the Director since the last Annual Report;
(o) a report on the status of all monitoring wells and a statement as to compliance with Regulation 903;
(p) a description and location of any leachate seeps identified during the daily inspection of the Site and the mitigative measures taken to address the presence of seeps;
(q) a summary of the daily inspections conducted over the monitoring period;
(r) any other information with respect to the Site which the District Manager may require from time to time;
(s) a copy of the most current ministry approved monitoring programs in table format;
(t) compliance status with all conditions of the Approval and the approved Design and Operations Plan;
(u) a "Monitoring and Screening Checklist" completed and signed by a Qualified Professional; and
(v) items identified in Section 7.7 Annual Progress Report of the Design and Operations Report;

13. CLOSURE PLAN

(1) At least two (2) years prior to the anticipated date of closure of this Site, or when the Site reaches 90% capacity, whichever comes first, the Owner shall submit to the Director for approval, with copies to the District Manager, a detailed Site closure plan pertaining to the termination of landfilling operations at this Site, post-closure inspection, maintenance and monitoring, and end use. The plan shall include but not be limited to the following information:
(a) A plan showing Site appearance after closure;
(b) A description of the proposed end-use of the Site;

(c) Description of the procedures for closure of the Site, including:

i. advance notification of the public of the landfill closure;
ii. posting of a sign at the Site entrance indicating the landfill is closed and identifying any alternative waste disposal arrangements;
iii. completion, inspection and maintenance of the final cover and landscaping;
iv. site security;
v. removal of unnecessary landfill-related structures, buildings and facilities;
vi. final construction of any control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas; and
vii. a schedule indicating the time-period for implementing sub-conditions (i) to (vi) above.

(d) Description of the procedures for post-closure care of the Site, including:

i. operation, inspection and maintenance of the control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas;
ii. record keeping and reporting; and
iii. complaint contact and response procedures;

(e) An assessment of the adequacy of and need to implement the contingency plans for leachate and landfill gas;
(f) An updated estimate of the contaminating life span of the Site, based on the results of the monitoring programs to date; and
(g) An update of the cost estimate for financial assurance and the amount which has been provided to the Director.
(2) The Site shall be closed in accordance with the closure plan as approved by the Director.
The following Schedule "A" forms part of this Approval

Schedule "A"

1. Application for an amendment to ECA No. A110302 for a vertical expansion. Signed by Richard Weldon, Managing Partner, 2270386 Ontario Limited. Dated April 26, 2019. The application includes all supporting documentation and consists of the following:

i. Design and Operations Report Vertical Expansion, Brooks Road Landfill Site, 2270386 Ontario Inc., Prepared by GHD, April 18, 2019;
ii. Appendix A - Provisional CofA No. A110302 and Amendments;
iii. Appendix B - Site Preparation Reports;
iv. Appendix C - Site Legal Surveys;
v. Appendix D - Geotechnical Assessment;
vi. Appendix E - HELP Model Outputs;
vii. Appendix F - Hydrologic Modeling;
vii. Appendix G - Surface Water Supporting Engineering Calculations;
viii. Appendix H - Landfill Gas Production and Air Dispersion Modeling Results;
ix. Appendix I - Fugitive Odour Best Management Practices Plan and BRE Odour Complaint Response Procedure;
ix. Appendix J - Trigger Level Program;
ix. Appendix K - Financial Assurance Plan; and
ix. Appendix L - Design and Operations Report Drawings.

2. Leachate Removal Plan, Brooks Road landfill Site Haldimand County, 2270386 Ontario Limited. Report No 90. Prepared by GHD, February 7, 2020.
3. Environmental Compliance Approval Application. Signed by Richard Weldon, Managing Partner, 2270386 Ontario Limited. Dated June 1, 2021.
4. Design and Operations Report, Vertical Expansion – Rev. 1, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited. Prepared by GHD, Signed/stamped and dated June 14, 2021.

5. Leachate Removal Plan - Revision 2, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited. Prepared by GHD, June 1, 2021.

	Field Blank	C	B	C	B

Notes:

1. Groundwater levels will be measured during May and November sampling events.
2. Surface water levels and flows will be measured for all sampling events.
3. **A - Indicator parameters (groundwater):** alkalinity, ammonia, barium, boron,

calcium, chloride, conductivity, iron, magnesium, nitrate, pH, sodium, TDS, sulphate, COD, and DOC.

4. **B - Metals:** aluminum, arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, nickel.

B - PAHs: naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(j)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, benzo(ghi)perylene.

B - VOCs: chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, trans-1,2-dichloroethene, methyl-t-butyl ether, 1,1-dichloroethane, methyl ethyl ketone, cis-1,2-dichloroethene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane trichloroethene, bromodichloromethane, cis-1,3-dichloropropene, methyl isobutyl ketone, trans-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m,p,o-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene.

B - Inorganic chemistry parameters: alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulfates, DOC, TDS, suspended solids, phenol, BOD5, COD, pH, total phosphorus, potassium, conductivity, calcium.

5. **C - Indicator parameters (surface water):** alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, pH, total phosphorus, TDS, suspended solids, sulphate, BOD5, COD, phenol, temperature, and dissolved oxygen.

6. **WL - only:** water level or leachate level only.

7. **Leachate:** Leachate water levels shall be collected on a monthly basis at leachate monitoring well LW1-17 and the inclined leachate collection sump riser pipe, while an annual leachate chemistry sample is required to be collected in May from the collection sump. Compliance with the leachate level elevation shall be determined by the pressure transducer that is located in the leachate collection sump riser pipe.

8. **Landfill Gas:** Sampling is to occur monthly from December 1 to April 30 and quarterly from May through November for % lower explosive limit methane concentration of combustible gas, carbon dioxide, oxygen and balance gases, gas pressure, and water level.

The following Schedule "C" forms part of this Approval

Schedule "C"

Table C1: Target leachate elevations to reach leachate elevation 191 m AMSL based on the date of March 27, 2020.

Date	Required Leachate Elevation	Estimated Leachate Volume in	Volume Removed in Excess of	Forecasted Leachate Generation	LTS Discharge to Ditch (m	Required Average Excess

	(m AMSL)	Landfill (m^3)	Generation (m^3)	Rate (m^3 /day)	^{3} /day)	Leachate Removal (m^3 /day)

1,040,000	191.1
1,045,065	191.0

The reasons for the imposition of these terms and conditions are as follows:

Conditions 1(1), 1(2), 1(4), 1(5), 1(6), 1(7), 1(8), 1(9), 1(10), 1(11), 1(13), 1(20), 1(21), 1(22), and 1(23) are to clarify the legal rights and responsibilities of the Owner and Operator under this Approval.
Conditions 1(3) and 7(4) are to ensure that the Site is designed, operated, monitored and maintained in accordance with the application and supporting documentation submitted by the Owner, and not in a manner which the Director has not been asked to consider.
Condition 1(12) is to ensure that the Site is operated under the corporate name which appears on the application form submitted for this approval and to ensure that the Director is informed of any changes.
Condition 1(14) is to restrict potential transfer or encumbrance of the Site without the approval of the Director and to ensure that any transfer of encumbrance can be made only on the basis that it will not endanger compliance with this Approval.
Condition 1(15) is to ensure that the successor is aware of its legal responsibilities.
Conditions 1(16), 1(17) and 1(18) clarify that the Part II.1 Director is an individual with authority pursuant to Section 197 of the Environmental Protection Act to require registration on title and provide any person with an interest in property before dealing with the property in any way to give a copy of the Approval to any person who will acquire an interest in the property as a result of the dealing.
Condition 1(19) is to ensure that appropriate Ministry staff has ready access to the Site for inspection of facilities, equipment, practices and operations required by the conditions in this Approval. This Condition is supplementary to the powers of entry afforded a Provincial Officer pursuant to the Act, the OWRA, the PA, the NMA and the SDWA.
Condition 1(24) clarifies what information may be subject to the Freedom of Information Act.
Condition 2(1) is to ensure that sufficient funds are available to the Ministry for closure and post-closure activities at the Site in the event that the Owner is unable or unwilling to do so.
Conditions 3(1), 3(11), 3(12), 3(13), 3(14), 3(15), 3(16), 12(1) and 12(2) are to ensure that the Site is operated, inspected and maintained in an environmentally acceptable manner and does not result in a hazard or nuisance to the natural environment or any person.
Conditions 3(2), 3(3), 3(4), and 3(5) are to specify the approved area from which waste may be accepted at the Site, and the types of waste that may be accepted for disposal at the Site based on the Owner's application and supporting documentation.
Conditions 3(6), 3(7), and 3(8) are to specify restrictions on the extent of landfilling and the maximum rates to be accepted for disposal at the Site based on the Owner's application and supporting documentation. These limits define the approved volumetric capacity of the site.
Conditions 3(9) and 3(10) are to ensure that users of the Site are fully aware of important information and restrictions related to Site operations and access under this Approval.

Condition 3(17) is to ensure open burning of municipal waste is unacceptable because of concerns with air emissions, smoke and other nuisance effects, and the potential fire hazard.
Condition 3(18) is to ensure that uncontrolled removal of material from waste at the Site is avoided. Scavenging of deposited waste can be detrimental to the public health and safety and cause damage to the natural environment.
Conditions 3(19) and 3(20) are to specify the hours of operation for the landfill site and a mechanism for amendment of the hours of operation, as required.
Conditions 3(21) and 3(22) are to ensure that the Site is supervised by properly trained staff in a manner which does not result in a hazard or nuisance to the natural environment or any person and to ensure the controlled access and integrity of the Site by preventing unauthorized access when the Site is closed and no site attendant is on duty.
Condition 3(23) is to specify the approval requirements for use of alternative cover material at the Site.
Condition 3(24) is to ensure that daily and intermediate cover is used to control potential nuisance effects, to facilitate vehicle access on the site, and to ensure an acceptable site appearance is maintained. The proper closure of a landfill site requires the application of a final cover which is aesthetically pleasing, controls infiltration, and is suitable for the end use planned for the site.
Condition 3(25) is to ensure that potential truck traffic impacts on the immediate local community is limited to the existing main roads.
Condition 3(26) is to ensure that public road servicing the Site (described as "Improvement Area") meets the applicable standards. Condition 3(26) also ensures that the Improvement Area is maintained regularly as per agreement between the Owner/Operator of the Site and Haldimand County.
Condition 4(1) is to provide the groundwater and surface water limits to prevent water pollution at the Site
Conditions 4(2), 4(3), 5(2), 6(4), and 7(2) are included to require the Owner to demonstrate that the Site is performing as designed and the impacts on the natural environment are acceptable. Regular monitoring allows for the analysis of trends over time and ensures that there is an early warning of potential problems so that any necessary remedial/contingency action can be taken.
Conditions 4(4), 4(5), and 4(6) are included to ensure the integrity of the groundwater monitoring network so that accurate monitoring results are achieved and the natural environment is protected.
Conditions 4(7), 4(8), and 4(9) are added to ensure the Owner has a plan with an organized set of procedures for identifying and responding to potential issues relating to groundwater and surface water contamination at the Site's compliance point.
Conditions 4(10), 4(11), and 4(12) are included to streamline the approval of the changes to the monitoring plan.
Condition 5(1) is added to ensure that leachate generated at this Site is disposed of in an environmentally acceptable manner.

Conditions 6(1), 6(2), 6(3), and 6(5) are to ensure that off-site migration of landfill gas is monitored and all buildings at the Site are free of any landfill gas accumulation, which due to a methane gas component may be explosive and thus create a danger to any persons at the Site.
Condition 7(1) is added to ensure to ensure that both surface water and stormwater is managed in an environmentally acceptable manner.
Conditions 8(1) and 8(2) are to ensure that the Site is operated by properly trained staff in a manner which does not result in a hazard or nuisance to the natural environment or any person.
Condition 9(1) is added to ensure that any complaints regarding landfill operations at this Site are responded to in a timely and efficient manner.
Condition 10(1) is to ensure the Owner immediately responds to a spill.
Conditions 10(2), 10(3), 10(4), and 10(5) are to ensure that the Owner notifies the Ministry forthwith of any spills so that an appropriate response can be determined.
Conditions 11(1), 11(2), 11(3), and 11(4) are added to establish a forum for the exchange of information and public dialogue on activities carried out at the landfill Site. Open communication with the public and local authorities is important in helping to maintain high standards for site operation and protection of the natural environment.
Condition 12(3) is to ensure that detailed records of Site inspections are recorded and maintained for inspection and information purposes.
Condition 12(4) and 12(5) are added to ensure that accurate waste records are maintained to ensure compliance with the conditions in this Approval (such as fill rate, site capacity, record keeping, annual reporting, and financial assurance requirements), the EPA and its regulations.
Conditions 12(6) and 12(7) are added to ensure that regular review of site development, operations and monitoring data is documented and any possible improvements to site design, operations or monitoring programs are identified. An annual report is an important tool used in reviewing site activities and for determining the effectiveness of site design.
Condition 13(1) is added to ensure that final closure of the Site is completed in an aesthetically pleasing manner, in accordance with Ministry standards, and to ensure the long-term protection of the health and safety of the public and the environment.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). A110302 issued on March 27, 2020

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;

b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment, Conservation and Parks
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 326-5370 or** www.ert.gov.on.ca

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 1st day of October, 2021

Mohsen Keyvani, P.Eng.
Director
appointed for the purposes of Part II.1 of the *Environmental Protection Act*

1.0 INTRODUCTION

This report, prepared by Conestoga-Rovers & Associates Limited (CRA) on behalf of Brooks Road Environmental c/o 2270386 Ontario Limited (BRE) (Owner, Proponent), presents the Stormwater Management Plan (SWM Plan) for the Brooks Road Landfill (Site) located at 160 Brooks Road in Cayuga, Haldimand County, Ontario. The Site is legally described as Part of Lot 24, Concession I-N.T.R., of the former North Cayuga Township, former Regional Municipality of Haldimand-Norfolk, and now Haldimand County. A Site location map is provided on Figure 1.

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (dated May 5, 2004), has an approved fill rate of 500 tonnes per day and a capacity of 624,065 m^3 (including waste, daily cover and interim cover). The Site was originally approved as a local landfill site in 1971, with amendments approved by the Ministry of the Environment (MOE) in 1974, 1979, 2002, 2004, 2005, 2007, 2011, 2012, and 2013.

The Site also operates under an amended Industrial Sewage Works Certificate of Approval Number 8371-6X9L6B (dated February 20, 2007) for the conveyance and discharge of stormwater runoff and leachate collection and disposal system.

The purpose of this report is to present an updated SWM Plan for the Site that is consistent with the current landfill design. The SWM Plan has been completed to support an application for an amended ECA for Industrial Sewage Works for the Site. CRA has reviewed the available background information, current landfill design, and conducted consultation with the MOE to obtain a full understanding of the work required.

This report does not address any changes to the leachate collection and disposal system. The Owner submitted an application to amend the design and operation of the leachate collection and disposal system. This application was submitted on March 16, 2013 (MOE Reference #5565-967NGT).

The SWM Plan was developed with reference to the Ontario Ministry of the Environment (MOE) Storm Water Management Planning and Design Manual (dated March 2003) and other applicable guidance documents.

1.1 PRELIMINARY CONSULTATION

Prior to the completion of the designs for SWM works on Site, CRA met with the MOE for pre-application consultation at a number of on-Site biweekly progress meetings for the Site Decommissioning and Stage 2A Construction project. Copies of the meeting minutes are included in Appendix A.

2.0 SITE BACKGROUND

2.1 SITE LOCATION

The Site is licensed to receive waste from all of Ontario but receives most of its post-diversion Industrial, Commercial, Institutional (IC&I) solid non-hazardous waste from within Haldimand County. The 12.4 hectares (ha) Site contains an approved fill area of approximately 6.07 ha.

The Site is irregular in shape and is located in a predominantly undeveloped area. The Site is currently surrounded by:

- Undeveloped land to the north. The former Canadian Southern Railway right-of-way directly to the north was purchased by the Owner in 2003 and has been utilized as a clean clay stockpile area since 2005
- Brooks Road to the west, and beyond by undeveloped and cultivated land
- Undeveloped and cultivated land to the south and east

This Site is not located in an area of development as defined by the Niagara Escarpment Planning and Development Act (NEPDA) and is not located on the Oak Ridges Moraine Conservation Area as defined by the Oak Ridges Moraine Conservation Plan (ORMCP).

2.2 SITE SETTING

The geographic, geologic, and hydrogeologic framework for the Site and surrounding area have been previously described in a report entitled Hydrogeologic Performance Assessment (dated October 2002), prepared by CRA. The previously reported information regarding the Site setting is summarized in the following sections.

Site Topography and Drainage

The Site is located within the Haldimand Clay Plain which is characterized by level topography and relatively poor drainage. The Site is located within jurisdiction of the Grand River Conservation Authority. The Site ultimately discharges runoff to the roadside ditch along the east side of Brooks Road which drains in a southerly direction through a culvert under the Canadian National Railway rail bed and empties into a small apparently natural stream channel which is the head waters of Norton Creek. Other drainage from adjacent lands to the west of Brooks Road also flows in culverts under Brooks Road to provide surface runoff to Norton Creek. Other surface runoff contributions include ephemeral streams on lands south of the Site that enter Norton Creek via culverts under the CNR rail bed. Norton Creek discharges directly to the Grand River.

Site Geology

The overburden geology is relatively uniform beneath the Site. In general the Site is characterized by a thick (14 to 18 m) glaciolacustrine layer of stratified silty clay, silty clay till and varied clays, underlain by a thin (1 to 3 m) discontinuous layer of silty sand till with varying concentrations of gravel and clay. The bedrock is encountered at depths varying from 15.2 to 20.2 m bgs. A thin surficial deposit of topsoil is generally observed at the surface of the Site, with the exception of the southwestern portion, where refuse associated with historical waste disposal activities in the original landfill area (OLA) was observed.

The decommissioning of the OLA commenced in August 2012 and was completed in early July 2013. The decommissioned area was backfilled using on-Site native silty clay and graded to facilitate drainage.

The silty clay deposits are described as being locally fractured (weathered) from the surface down to depths varying from 3 to 5 m bgs, and are characterized as a very stiff to hard unit with low plasticity. At depths in excess of 5 m, the silty clay deposits have little to no fracturing and the consistency of the units decrease to stiff to very stiff.

Underlying the silty clay deposits, a thin discontinuous silty sand till with varying concentration of clay and gravel is encountered across the Site. The silty sand till ranges in thickness from 1 to 3 m and often contains cobbles and/or broken angular bedrock fragments. This deposit is usually well graded with fine to medium grained sand, minor silt and trace clay, and is described as dense to compact, grey and saturated. The silty sand till rests directly over the bedrock.

Bedrock underlying the Site has been described as a fractured shale, dolostone and gypsum of the Salina Formation. The top of bedrock elevation ranges from 180.80 to 185.73 m above mean sea level (AMSL), and forms a small bedrock valley from northwest to southeast across the Site. The small depression is characterized by the thicker silty sand till deposit. Regionally the bedrock topography dips to the south.

Site Hydrogeology

In general, the geologic units identified at the Site have been grouped into two main hydrogeologic units, as follows:

i) An unconfined water table (shallow overburden) unit within the permeable refuse in the OLA and the shallow fractured silty clay (weathered) unit

ii) A confined deep overburden/shallow bedrock aquifer

The shallow overburden unit is essentially a perched water table resting on the impermeable un-weathered clay units. The large variation in hydraulic conductivity between the refuse material and the surrounding silty clay explains the groundwater mounding effect historically observed in the OLA. Now that the waste within the OLA has been decommissioned and the area has been backfilled with silty clay, the shallow overburden unit mound has been effectively removed from the Site. Historically, these two hydrogeological units were separated by a thick (between 9 and 12 m) layer of stratified silty clay, silty clay till, and varied clays which forms an aquitard of very low hydraulic conductivity. Groundwater level data historically gathered from the shallow overburden unit and deeper overburden/shallow bedrock aquifer indicate that the presence of the clay aquitard results in hydraulic separation of the two units. A water head varying from 9.5 to 15 m has been historically measured at the location of nested wells.

Underlying the silty clay aquitard, a confined deep overburden/shallow bedrock aquifer was observed within the lower portion of the silty sand till unit and the shallow fractured bedrock. Groundwater quality and water level data historically gathered from monitoring wells screened within the lower silty sand till unit exhibited similar hydrostatic levels and hydrochemical characteristics which are not substantially different from samples obtained from well nests screened solely with the shallow bedrock. Therefore these two geological units have been generally considered to form one aquifer.

Based on the groundwater data obtained to date, the deep overburden/shallow bedrock aquifer is generally encountered at depths varying from 14 to 17 m bgs. The groundwater flow pattern of this aquifer is generally characterized by a weak gradient and a southerly flow.

2.3 EXISTING SITE CONDITIONS

The existing Site topography (based on the March 2013 topographical survey data) and ancillary features are presented on Drawing 2. The Site works and development currently consists of the following:

- Site Support and Staging Area with a scale and multiple trailers for office staff and storage.
- The landfill is being constructed in three distinct stages named as: Stage 1, Stage 2, Stage 3 and are described as follows:
  - Stage 1 cell construction commenced in December 2006 and was completed in October 2007. The Stage 1 landfill area has an interim cap constructed as per the approved Design and Operations Report (D&O), dated November 2003.
  - Currently Stage 2 has been excavated and approximately 2/3 of the cell has been constructed and lined. The completed portion has been designated as Stage 2A. Stage 2A is currently accepting landfill waste and Stage 2B/3A will be constructed in the future.
  - The Site design provides for three disposal stages that will be constructed in a progressive manner from east (Stage 1) to west (Stage 3). Further information concerning the detailed design of the landfill is provided within the approved D&O.
- The decommissioning of the OLA was completed in early July 2013. This included:
  - The removal of all refuse within the OLA
  - The removal of all impounded water and leachate within the OLA
  - Backfilling of the OLA to match adjacent topography
  - Grading of the OLA to provide adequate drainage
- A series of temporary dewatering sedimentation ponds (TDS Ponds) have been constructed to collect existing Site runoff. The ponds operate in a closed position whereby stormwater is pumped from the ponds to the roadside ditch after water samples meet the trigger parameter requirements detailed in the current Industrial Sewage C of A number 8371-6X9L6B

- A swampy area is located in the south-east corner of the Site. No work is proposed within this area. The area has a relatively small contributing drainage area with no apparent discharge location.
- A series of visual screening berms which also serve to divide site runoff constructed as per the approved D&O Plan

Stormwater runoff from the active landfilling area is collected within the landfill cell as leachate where it is eventually pumped into tankers for off-Site disposal. Stormwater runoff from the capped portion of the Stage 1 landfill cell is directed to the TDS ponds. Stormwater collected to the west of Stage 2A, within the future landfill cell excavation, is manually pumped to the TDS ponds. The surrounding area sheet flows from the Site, ultimately discharging to the east ditch along Brooks Road which forms the headwaters of four areas, identified as Outfall 1 and 2 on Drawing 2.

2.4 REGULATORY SETTING

The landfill currently operates as a waste disposal facility under Permit Number A110302. The D&O for the landfill was originally completed in November 2003. The approved final contours presented in the D&O were updated by Genivar Inc. and approved by the MOE in June 2012.

The Site also operates under an amended Industrial Sewage Works Certificate of Approval Number 8371-6X9L6B (dated February 20, 2007) for the conveyance and discharge of stormwater runoff and leachate collection and disposal system. The Permit is based upon a SWM Plan and subsequent correspondence submitted by CRA in February 2004. This report formed the basis for establishing accepted limits for the total peak runoff discharge from the Site for various rainfall events identified as the Existing Conditions within the original Plan.

At the request of the MOE, an Interim Stormwater Management Plan (ISWMP) was prepared for the Site in January 2012. The purpose of the ISWMP was to improve the existing stormwater management system and increase the overall capacity of the temporary dewatering sedimentation pond (TDS pond). The ISWMP was approved by the MOE on January 3, 2013 and is scheduled for completion in 2013.

The Site is currently at the early stages of completing an individual Environmental Assessment (EA) related to a proposed vertical expansion of the landfill. The vertical capacity expansion being proposed will be for approximately 421,000 m^3 (including waste, daily cover and final cover) of additional capacity, which will be achieved

through a re-engineering of the Site's final contours. The revision of final contours proposed under the EA will also require some redesign of the approved on-Site stormwater management system (due to altered waste slopes). The proposed final contours were considered in this report to prevent the need to revise the stormwater works in the future should the final contours be approved. All changes considered herein will occur within the Site's existing waste footprint and Site boundaries.

3.0 PROPOSED SITE CONDITIONS

3.1 GENERAL DESCRIPTION

The Site development is generally consistent with the original D&O report with respect to the handling and discharge of runoff. The differences between the existing C of A and the Site conditions described below are due to changes in the final contours or topography of the landfill area.

This report provides an updated SWM Plan that considers recent changes to the landfill design. The following three conditions have been assessed:

1. Interim Condition which considers the most recent upgrades to the stormwater conveyance system (ditches, culverts) and modifications to the existing TDS pond.
2. Currently Approved Post Closure Condition which considers the most recently approved post-closure grading plan.
3. Proposed Vertical Expansion Condition which considers the proposed closure plan, currently undergoing an individual EA.

Design drawings have been prepared to support the stormwater management system for the Interim, Currently Approved, and Proposed Vertical Expansion Conditions. These design drawings have been bound separately to this report and comprise a select number of drawings of the larger Design and Operations Plans for the Site.

3.2 DESIGN CRITERIA

The stormwater management system for the Site was designed to provide water quality and water quantity control of surface water runoff. Water quality treatment will be provided through extended detention of the 4-hour duration 25 mm storm event. The stormwater management pond is proposed to provide water quantity control for all storm events up to the 100-year storm, via attenuation of peak flows to below the Existing Condition, as outlined within the original SWM Plan. Estimated runoff from the Regional Storm (Hurricane Hazel) has been assessed to demonstrate safe passage to downstream receivers.

At a minimum, internal drainage ditches were sized to accommodate the peak flow generated from the 3-hour duration 25-year storm, as required by the MOE Guidelines.

3.3 INTERIM CONDITION STORMWATER MANAGEMENT SYSTEM

The MOE requested the ISWMP be developed for the Site. This plan was developed within the CRA technical memo dated January 3, 2013 and consisted of improvements in collecting and routing runoff from the capped portion of the landfill, around the active landfill area, towards the TDS Pond. The ISWMP also consisted of an expansion to the TDS Pond. The ISWMP technical memo has been provided as Appendix B.

Construction activities associated with the ISWMP are scheduled to be completed in September 2013.

3.4 CURRENTLY APPROVED POST CLOSURE CONDITION

The currently approved post-closure Site plan is presented on Drawing 5. Site runoff is discharged from two outfalls located at the Site. Runoff discharging towards Outfall 1 is characterized as an undeveloped area of land in the south-east corner of the Site where no work or changes are being proposed. The remainder of the Site area is directed towards Outfall 2. This SWM Plan provides engineered design for stormwater runoff collected and discharged to Outfall 2, upon final closure of the landfill.

The proposed final layout includes a fully capped landfill with a final cover that consists of a 0.6 m thick soil cover overlain with a 0.15 m topsoil layer and a vegetative cover. The soil cover will consist of on-Site material and/or imported material to provide a cover that will allow a minimum infiltration rate of 0.15 m per year in accordance with O. Reg. 232/98 for an engineered site. The topsoil used in final cover construction will be obtained from on-Site areas stripped in preparation for landfill construction. Runoff generated from the landfill will be collected within a perimeter ditch and directed towards a stormwater management pond (SWM Pond). The SWM Pond has an outlet structure to attenuate peak flows and an emergency spillway to convey excess runoff off-Site during larger storm events. The SWM Pond ultimately discharges towards Outfall 2 which discharges into a roadside drainage ditch along the east side of Brooks Road.

The drainage boundaries for the currently approved post-closure condition are presented on Figure 2. Figure 3 presents the flow schematic for the proposed conditions and illustrates how each catchment is routed to Outfall 1 and Outfall 2.

Catchment 100 will remain undeveloped with the exception of a small portion of the access roads which bound the north and west part of this catchment. This catchment has

sufficient internal storage capacity to retain all surface water runoff resulting from the Regional storm event. Catchment 100 discharges towards Outfall 1 (the swampy area).

Catchments Series 200 (201 through to 210) discharge to the SWM Pond. Catchments 201, 202, 203 and 204 represent the currently approved post-closure landfill cap area. The landfill cap area is encompassed with a perimeter ditch that drains in two directions from the northeast corner of the landfill, to the southwest corner of the landfill. Catchments 201, 202, 203, and 204 drain to the north, west, east and south side perimeter ditches respectively. From the southwest corner of the landfill, the perimeter ditch drains through two 600 mm diameter culvert and an open ditch to the stormwater management pond. Catchment 205 and 206 encompass the area between the landfill perimeter access road and the visual screening berms to the north and west. Catchment 205 and 206 will drain directly to the stormwater management pond via perimeter ditches along the north and west side of the access road. Catchment 207 and 208 encompass the Segregated Recyclable Material Storage Area, Site trailers and scales. This area is a gravel parking lot with numerous bins, trailers, and a weigh scale. This area will sheet flow to the north and runoff will be collected by a drainage ditch that discharges to the SWM Pond. Catchment 209 and 210 encompass the SWM Pond and small undeveloped area east of the SWM Pond. The pond will discharge to the southwest and towards the drainage ditch along Brooks Road which outlets off-Site, known as Outfall 2.

Catchment 301 will also remain undeveloped with the exception of that portion of the visual screening berm that bounds the catchment to the west. Construction of the berm will have an insignificant impact on flows from this catchment.

Catchment 302 will remain largely undeveloped with the exception of a berm that will be constructed to the west of the landfill area. Surface water runoff from Catchment 302 will continue to drain south along the western ditch along Brooks Road to the Site outlet, as in existing conditions. Catchment 303 will be a small area at the southwest corner of the Site formed by a proposed berm and the Site boundary. Surface water runoff from this catchment will drain to the Site discharge point in the western ditch.

3.5 PROPOSED VERTICAL EXPANSION STORMWATER MANAGEMENT SYSTEM

The proposed vertical expansion post-closure Site plan is presented on Figure 4. The proposed vertical expansion condition stormwater conveyance system is very similar to the currently approved system with the exception that the overall landfill height has

increased. Increasing the vertical height of the landfill changes the overall catchment slope.

The drainage boundaries for the proposed vertical expansion condition are presented on Figure 5. Figure 6 presents the flow schematic of the proposed conditions and illustrates how each catchment is routed to Outfall 1 and Outfall 2.

3.6 PROPOSED STORMWATER MANAGEMENT MEASURES

Post-closure stormwater management controls are proposed for each condition to mitigate the effects of increased peak flows due to the landfill development. For the currently approved and proposed vertical expansion conditions these controls will include internal drainage ditches and a stormwater management pond.

A 1-metre deep drainage ditch will be constructed around the perimeter of the landfill area and will convey runoff from the landfill cap and access road to the stormwater management pond. The MOE Guidelines require that all internal drainage ditches have sufficient capacity to convey the peak flows generated from a 25-year design storm, with a continuous overland flow route to convey flows from the 100-year and Regional storm events. The proposed ditches will have capacity to convey flow in excess of that generated by the 100-year or Regional storm. The ditches are proposed to have 4:1 (horizontal:vertical) side slopes on the landfill side, and 3:1 side slopes on the perimeter access road side of the ditches.

The stormwater management pond is proposed in Catchment 210. A wet pond is proposed with a maximum permanent pool depth of 0.6 m. The pond is proposed with 4:1 side slopes, and a berm in the midsection of the pond that will create an extended flow path, which will allow for additional settling of suspended solids. A forebay at the pond inlet is proposed to enhance water quality and capture coarse grained sediments. The pond will receive the discharge from the landfill cap perimeter ditches through two 600 mm diameter concrete culverts and an open swale.

The pond outlet is proposed to consist of a perforated pipe with a 75 mm orifice plate at the permanent pool elevation, an overflow catchbasin located in the pond side slope with an inlet located at the 5-year ponding elevation, and an emergency overflow berm. Surface water runoff volumes up to the 5-year storm event will be discharged via the riser pipe outlet. The outlet structure design will provide 24 hours of extended detention for the 25 mm storm event runoff volume. The control structure will outlet via two 375 mm diameter concrete pipes at an invert of 197.77 m. The riser pipe outlet will be outfitted with a sluice gate to temporarily prevent discharge from the pond up to a

5-year storm event should concerns with stormwater quality arise. The gate will normally remain in the open position. In the event of a spill or if there is a potential to release impacted water (i.e., an oily sheen is visible in the pond), the gate shall be closed and the impacted waters shall be contained. The waters shall be tested and disposed of in accordance with the appropriate means and methods.

The proposed stormwater management pond will have a permanent pool volume of 1,266 m^3 and a total live storage volume in excess of 5,502 m^3. For the proposed vertical expansion conditions the pond will meet requirements for discharge with total off-Site discharge for the Regional storm event calculated to be 0.82 m^3/s. As outlined by the MOE Guidelines, the stormwater management pond will have sufficient capacity to detain the runoff from all storm events up to and including the Regional storm event. This volume is in excess of the MOE Draft Stormwater Management Planning and Design Manual (November, 1999) requirements for Level I (Enhanced) protection.

The proposed stormwater management construction details are presented on Drawings 12 and 13.

4.0 HYDROLOGIC ANALYSIS

The following hydrologic analysis was completed to calculate peak flows and runoff volumes from the Site under various storm event conditions. The computer model PCSWMM 2012 Version 5.0.022 was used to complete the analysis. Distinct design storm hyetographs were created in PCSWMM, based on the Environment Canada's Rainfall Intensity Duration Frequency (IDF) Values for the Hamilton Airport. The 2-, 5-, 10-, 25-, 50-, and 100-year 24-hour, SCS Type-2 distribution, storm events were considered in the hydrologic modelling to provide a design basis for on-Site SWM features (quantity control). The IDF Values for the each of these storm events are summarized in Table 1.

CRA also assessed the performance of the water quality management features using the 25-mm, 4-hour duration storm, consistent with MOE's "Storm Water Management Practices – Planning and Design Manual" (2003).

CRA has developed two model scenarios identified as follows:

1. The Currently Approved Post-Closure condition.
2. The Proposed Vertical Expansion condition

These modelling scenarios were compared to the results obtained from the original SWM Report for the Existing Condition and the Interim Condition (as presented within Appendix B).

4.1 MODELLING RESULTS

The stormwater management pond and drainage ditches were designed based on accepted methodologies, calculations, and analytical tools using the hydrologic model PCSWMM. Hydrologic modelling output for the currently approved condition is provided in Appendix C, and for the proposed vertical expansion is provided in Appendix D. Supporting engineering calculations are provided in Appendix E.

The hydrologic model was used to calculate the surface water runoff volumes for the Site under the various conditions.

Table 2 summarizes the model input parameters for the currently approved post-closure condition. Table 3 summarizes the model input parameters for the proposed vertical expansion condition.

Table 4 presents the calculated runoff peak flow rates for proposed vertical expansion conditions and compares them to the existing condition. The peak flows represent the overland runoff peak flows for the various catchments, with the off-site discharge peak flows presented as the Outlet peak flow values. The runoff peak flows for all storm events less than the 100-Year event decrease from existing to post-closure conditions, meeting the requirements set out in the MOE Guidelines. The Regional Storm Event generates a slightly higher peak flow as a result of the proposed development. The 75 mm-diameter orifice outlet provides in excess of 24 hours of extended detention of the 25 mm storm event runoff volume.

Table 5 summarizes the runoff volumes calculated for each catchment under the currently approved and proposed vertical expansion conditions and compares them to the existing condition. Because some surface water remains within certain catchments, the total Site runoff volume does not represent the total volume of surface water runoff actually discharged off site.

Table 6 summarizes pond performance showing peak inflows and outflows, maximum ponding elevations, and maximum storage volumes for the currently approved and proposed vertical expansion condition.

5.0 EROSION AND SEDIMENT CONTROL PLAN

The stormwater management pond was designed to promote settling of suspended particulate and to minimize re-suspension of the solid matter. The settling action will reduce suspended soil particles and other pollutants, which may be in particulate form and/or adhered to the soil particles.

The perimeter ditching network and stormwater management pond will be maintained by removal of collected sediment on an "as-required" basis to ensure that the ditching and pond continue to operate as designed. Accumulated sediment will be removed when the storage capacity of a channel or the pond is reduced by one third. All sediment removed during the operating life of the landfill will be returned to the active disposal area. Subsequent to landfill closure, all dredged sediments will be returned to the landfill and placed as final cover soil. Zones where sediments are placed as part of final cover activities shall be bounded by silt fence until such time as the vegetation has reached 70 percent of the native background density. Sediment transport from the landfill area will decrease as the vegetative cover over completed areas of the landfill is established.

Additional measures will also be employed to minimize sediment transport at the source and prevent runoff that has contacted landfilled waste, which may contain particulate and/or soluble pollutants, from migrating from the landfill area. These measures are as follows:

- temporary soil berms will be utilized throughout the active landfill disposal area to prevent runoff from leaving waste areas and to direct upgradient runoff around the active disposal area
- all water that has contacted landfilled waste will be treated as leachate and will be drained by a leachate system, pumped and transported off-Site for disposal
- rock and straw bale check dams and/or silt fences will be utilized in drainage swales and on slopes to enhance erosion and sedimentation control during and immediately after construction phases in locations where necessary

6.0 MONITORING PLANS

The Site is currently staffed full-time by landfill staff to oversee Site operations. Regular visual inspections shall be made on a monthly basis during active construction activities to assess the effectiveness of the erosion and sediment control measures implemented, and to conduct any required maintenance activities. After the period of active construction activities has been completed (final installation of the landfill cap), regular visual inspections shall be made on a bi-monthly basis until adequate Site stabilization is achieved.

Erosion and sediment controls shall be maintained until all disturbed areas of the Site, including the pond and swales, have fully stabilized and vegetated areas have achieved 70 percent of the native background density of growth.

The condition of all swales, culverts, vegetation, infiltration basin outlet, and outflow channels leading to the Brooks Road drainage ditch and off Site will be noted at regular intervals. Should any defects be identified, appropriate corrective actions will be scheduled and tracked. Regular maintenance of SWM Plan features and unscheduled corrective actions will be conducted during appropriate seasons and concurrent with other Site operations.

7.0 CONCLUSION

The proposed stormwater management measures meet the requirements set out by the MOE Guidelines.

The proposed stormwater management measures as described in this Stormwater Management Plan are based on the modeling and design calculations described in this report. These proposed measures consist of drainage ditches and a stormwater management pond. The internal drainage ditches and stormwater management pond are adequately sized to accommodate the peak flows and runoff volumes for the 25-year and Regional storm events respectively. The total off-site peak discharge rates for post-closure conditions will be less than existing conditions for all storm events.

Should you have any questions on the above, please do not hesitate to contact us.

All of Which is Respectfully Submitted,

PRE-APPLICATION CONSULTATION RECORDS

CONESTOGA-ROVERS & ASSOCIATES

MEETING MINUTES

Reference No. 018235

PROJECT: Site Decommissioning and Stage 2A Construction

OWNER: Brooks Road Environmental c/o 2270386 Ontario Limited CONTRACT NO.: 018235 (33)

RE: Progress Meeting No. 6

LOCATION: Brooks Road Landfill Site DATE: November 01, 2012 TIME: 1:00 pm

Participants:

Reid Robertson (BRE)	Allison Butcher (MOE)	Paul Zizek (Tervita)	Jordan Wilson (Tervita)
Dan Roberts (Tervita)	Peter Kemp (CRA)	Dan Turner (CRA)	

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	Richard Weldon (BRE)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the October 16, 2012 Progress Meeting No. 5 were reviewed. The following items were noted: • Drainage stone submittal has been submitted by Tervita and approved by CRA • Geotextile roll certificates have been submitted by Tervita and under review by CRA • Tervita to submit finalized Off-Site Transportation and Disposal Plan	 CRA Tervita
2.	**Work progress and Construction Progress Schedule** An updated construction schedule is provided as an attachment to the minutes. Key changes include: • HDPE liner installation anticipated to begin November 12, 2012 and complete November 21, 2012 • Current schedule anticipates cell completion on December 11, 2012	
3.	**Field Observations, Problems, and Decisions** Weather over the past week has caused significant delays due to high volumes of precipitation. Wet weather conditions have pushed the construction schedule back approximately 1 week. Accumulated water in the Stage 2A cell is being pumped to the TDS pond. The pond will be sampled this Friday and Reid will have a quicker turnaround time applied to the sample results in order to discharge water to the roadside ditch sooner.	

Item	*Description*	*Action By*
3.	**<u>Field Observations, Problems, and Decisions</u> (cont'd)** Zizek – Will look into bringing in a second packer to work on the south slope for the compacted clay liner (CCL). Using this approach would not reduce the working days necessary for cell completion, but would act as a contingency to ensure that there are no delays associated with subsequent HDPE liner installation. Approximately 2 to 3 days are required to decommission the estimated 1,500 cubic metres of waste in the Phase 1 Decommissioning Area that is above the remaining clay to be excavated for Stage 2A cell construction. This quantity is in addition to the estimated 10,000 cubic metres of waste in the Phase 1 area that is outside of the clay excavation area. The 1,500 cubic metres of waste will be directly hauled and disposed of in the Stage 1 cell. Kemp – Proposes to temporarily stockpile the remaining 10,000 cubic metres of waste in the Stage 1 cell, as opposed to the Phase 2 Decommissioning Area, with the intention of moving the waste into the Stage 2A cell when completed. Ideally, the waste would be moved into the Stage 2A cell after an appropriate lift of incoming waste were placed on the base of the cell in order to optimize the leachate collection system. The additional benefit would be significant time savings associated with decommissioning the Phase 2 area.	Tervita
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** If wet weather conditions persist, further delays can be expected. No other problems were identified at this time.	
5.	**<u>Submittals Schedule and Status of Submittals</u>** Tervita to submit finalized Off-Site Transportation and Disposal Plan	
6.	**<u>Health and Safety Concerns</u>** No health and safety concerns were identified at this time. Open excavation areas have been promptly taped off and appropriate signage has been set up.	
7.	**<u>Maintenance of Progress Schedule</u>** The construction schedule has been updated to reflect delays associated with unfavourable weather conditions. Zizek – A proposed shutdown has been built into the construction schedule at Christmas time. Actual days for shutdown will be contingent on work progress to date.	
8.	**<u>Effect of Proposed Changes on Progress Schedule and Coordination</u>** There are no proposed changes at this time.	

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
9.	**Contract Administration** Payment Certificate 3 has been executed. Tervita will provide Payment Certificate 4 for CRA review on Friday November 9, 2012.	
10.	**Other Business Relating to the Work** Butcher – Noted that groundwater sampling is to be completed this month at the Site. Asked whether any decision has been made regarding the damaged wells on the northern perimeter of the site. Also noted that there may be a damaged well at the southeastern portion of the Site. Kemp – The location of the damaged wells and the subsurface soil conditions in which they are installed needs to be assessed to determine whether the wells can be moved. The concern with reinstalling the wells in the same locations is that there is a risk of reoccurring damage. Butcher – A proposal may be submitted to the MOE detailing the reinstallation of the groundwater monitoring wells. Butcher – Noted some exposed waste at the north end of the Stage 1 cell due to heavy rainfall. Robertson – Has discussed the exposed waste with Tervita and cover material will be placed over the exposed area. Kemp – Due to weather conditions, the site survey required for the Interim Stormwater Management Plan has been delayed. Is it possible to adjust the submission time of the Interim Stormwater Management Plan? Butcher – May be able to adjust the submission time to accommodate the delay. Peter Kemp to send an email detailing the proposed delay.	CRA CRA

☒ Attachments: Updated Project Schedule

Prepared By: Dan Turner and Peter Kemp Date Issued: November 9, 2012

This confirms and records CRA's interpretation of the discussions which occurred and our understanding reached during this meeting. Unless notified in writing within 3 days of the date issued, we will assume that the following interpretation or description is complete and accurate.

ID	Task Name	Duration
1	Notice to Proceed	0 days
2	Mobilization and Startup (includes silt fencing/straw bale check dams)	5 days
3	Clearing and grubbing	3 days
4	Set-up of staging and decon for first stage of waste excavation	2 days
5	Completion of east temporary berm	1 day
6	Bulk Clay Excavation (approximately 9,000 m3)	5 days
7	Direct haul of 9000 m3 of waste to Cell 1 (including 500 m3 of possible segregation)	7 days
8	Completion of temporary berm along west and south extents of waste removed	1 day
9	Excavate and stockpile on-site approximately 39,000 m3 of native clay	19 days
10	Construction of Compacted Clay Layer	27 days
11	HDPE liner	8 days
12	Non-woven geotextile	3 days
13	Completion of temporary divider berm as per drawing C-03	2 days
14	Excavate 5000 m3 of waste and stockpile on Phase 2	14 days
15	Excavate and stockpile on-site approximately 43,000 m3 of native clay	25 days
16	Drainage layer material/Leachate pipe installation	8 days
17	Woven geotextile	3 days
18	Video inspection of leachate collection system pipe	2 days
19	Excavate remaining 10000 m3 of waste and stockpile on Phase 2	7 days
20	Christmas Break	7 days
21	Backfill and grading of decommissioning areas	5 days
22	Hydroseeding	5 days
23	Demobilization and closeout	4 days

MEETING MINUTES

Reference No. 018235

PROJECT: Site Decommissioning and Stage 2A Construction

OWNER: Brooks Road Environmental c/o 2270386 Ontario Limited CONTRACT NO.: 018235 (33)

RE: Progress Meeting No. 9

LOCATION: Brooks Road Landfill Site DATE: December 11, 2012 TIME: 9:30 am

Participants:

Richard Weldon (BRE)	Reid Robertson (BRE)	Paul Zizek (Tervita)	Dan Roberts (Tervita)
Allison Butcher (MOE)	Peter Kemp (CRA)	Dan Turner (CRA)	

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	John Beals (MOE)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the November 27, 2012 Progress Meeting No. 8 were reviewed. The following items were noted:	
	• Tervita to submit finalized Off-Site Transportation and Disposal Plan.	Tervita
	• CRA has received comments from the MOE regarding the Interim Stormwater Management Plan (ISWMP). CRA to address comments and resubmit to the MOE.	CRA
	• Tervita confirmed receipt of payment for Payment Certificate 4.	
	• MOE has provided a letter detailing an allowance for temporary stockpiling of historical waste on the Stage 1 cell.	
	• CRA and Tervita will discuss the required change order for removal of Phase II Decommissioning Area waste.	CRA/Tervita
	• CRA and Tervita have discussed the temporary separation berm design between Stage 2A and 2B. The berm will not be modified from the original design.	
	• The leachate collection pipes have been installed in Stage 2A. The northern pipe was installed at a modified slope due to the Stage 1 pipe being constructed at a higher elevation than designed.	
	• Tervita has submitted QA/QC information for HDPE liner installation from Terrafix to CRA with the exception of the required subgrade acceptance forms. Tervita to submit the remaining information from Terrafix.	Tervita
	• Tervita has submitted some gradation samples for the drainage stone and will continue to submit samples as they are received.	Tervita

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
1.	**<u>Review of Previous Meeting Minutes</u> (cont'd)**	
	• Payment Certificate 5 has been submitted to CRA and a recommendation for payment will be issued pending receipt of statutory declaration from Tervita.	Tervita
	• Tervita to submit costs for cleaning leachate collection system piping for CRA to develop a change order. Cleaning of leachate collection pipes to be done in conjunction with the video inspection of the leachate collection pipes.	Tervita
	• Six soil gas probes have been installed at the site. MOE requested a drawing showing the locations of the installed probes, as well as a letter detailing the reasoning for installing six probes instead of the eight stipulated in the approved Design and Operations Report (CRA, 2003). MOE also noted that the letter can contain a request for revised landfill gas monitoring frequency as was previously discussed by CRA.	CRA
2.	**<u>Work progress and Construction Progress Schedule</u>** Zizek – Detailed progress to date and expected completion times • The drainage stone in the base of the cell will be graded today and tomorrow • Leachate pipes have been installed • Drainage stone placement on sideslopes is taking longer than expected. • Cell completion is anticipated for mid next week • It will likely take 1 week to construct a ramp of waste into Stage 2A Weldon – Requested 3 days' notice of cell completion.	Tervita
3.	**<u>Field Observations, Problems, and Decisions</u>** Turner – While attempting to push stone up the northern sideslope, the non-woven geotextile pulled down and the HDPE liner was damaged. The damage has been repaired however Tervita will need a new method for stone placement to prevent further damage. Zizek/Roberts – The anchor trenches will be backfilled to prevent geotextile movement and the stone will be placed halfway up the slope in a 1-metre-thick lift before slowly pushing stone up the remaining portion of the slope. There is potential to bring in another dozer to expedite the process.	
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** No problems were identified at this time.	
5.	**<u>Submittals Schedule and Status of Submittals</u>**	
	• Tervita to submit finalized Off-Site Transportation and Disposal Plan	Tervita
	• Tervita to submit Terrafix subgrade acceptance forms to CRA	Tervita
	• Tervita to submit gradation testing for drainage stone to CRA	Tervita

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
6.	**Health and Safety Concerns** No health and safety concerns were identified at this time.	
7.	**Maintenance of Progress Schedule** No maintenance is required on the progress schedule at this time.	
8.	**Effect of Proposed Changes on Progress Schedule and Coordination** There are no proposed changes at this time.	
9.	**Contract Administration** Payment Certificate 5 statutory declaration will be submitted Wednesday, December 12. A change order will be developed for Phase II decommissioning. A change order will be developed for cleaning of leachate pipes concurrently with the video inspection.	Tervita CRA/Tervita CRA/Tervita
10.	**Other Business Relating to the Work** No other business was identified at this time

MEETING MINUTES

Reference No. 018235

PROJECT: Site Decommissioning and Stage 2A Construction

OWNER: Brooks Road Environmental c/o 2270386 Ontario Limited

CONTRACT NO.: 018235 (33)

RE: Construction Progress Meeting No. 12

LOCATION: Brooks Road Landfill Site

DATE: February 14, 2013

TIME: 11:00 AM

Participants:

Richard Weldon (BRE)	Reid Robertson (BRE)	Doug Robinson (BRE)	Paul Zizek (Tervita)
Jordan Wilson (Tervita)	Allison Butcher (MOE)	Peter Kemp (CRA)	Dan Turner (CRA)

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	Joel Rider (Tervita)
		John Beals (MOE)	Dan Roberts (Tervita)	Brad Farnand (MOE)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the January 30, 2013 Progress Meeting No. 11 were reviewed. The following items were noted:	
	• The MOE district office has received the letter application to revise the landfill gas monitoring frequency. Allison Butcher to check on status of request with Approvals Branch.	MOE
	• Tervita completed repairs upon returning to work after unfavourable weather conditions including: placing cover over exposed Phase II waste, reconstructing divider berm in the vicinity of the disposal trench, and completing the final panel of woven geotextile on the north sideslope.	
	• Tervita has provided an updated construction schedule	
	• CRA has developed a Change Order for Stage 1 grading of waste to final contours and interim cover application. Brooks Road to review and approve the Change Order.	BRE
	• Brooks Road to send PLC minutes to CRA and develop action item list for distribution to PLC prior to next meeting.	BRE
	• Brooks Road to develop Terms of Reference for PLC meeting	BRE
	• CRA requested MOE notes from PLC meeting. Butcher to send notes to Kemp	MOE
	• Robinson – Noted that the application for alternative daily cover is broad and may take more time to approve. Requested that Butcher look into the possibility of pre-approving tarps as an alternative daily cover in the interim.	

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
1.	**<u>Review of Previous Meeting Minutes</u> (cont'd)**	
	• Butcher – Will look into possibility of pre-approval	MOE
	• Three Baker tanks have arrived on-Site and Brooks Road intends to store leachate in the tanks until a leachate treatment system is installed on-Site. Brooks Road is looking into an insulation material for the tanks comprised of agricultural material.	
	• Butcher – Would like to talk to agricultural group of MOE about feasibility of using this material as insulation.	
	• Wilson – Could use submersible pumps to keep stored leachate from freezing.	
	• CRA estimated that approximately 1,000,000 litres of leachate is present in the landfill when the leachate level is at 60 cm.	
	• CRA requested information on leachate quantity trucked off-Site in order to estimate the leachate generation rate. BRE to supply trucking invoices.	BRE
2.	**<u>Work progress and Construction Progress Schedule</u>** Zizek – Detailed progress to date and expected completion times: • Phase I decommissioning will be completed today • Phase II decommissioning scheduled to begin Monday • Item 18 in the attached schedule (excavation of remaining Stage 2 clay) includes approximately 11,000 m^3. This material will be used to backfill decommissioned areas. • Contract Works, including Stage 1 waste grading/interim capping and ISWMP Works, are scheduled to be complete at the end of June Weldon – Wants interim capping works expedited to minimize leachate generation.	
3.	**<u>Field Observations, Problems, and Decisions</u>** Zizek – Weather conditions have prevented Tervita from working 7 out of 20 days in January. Turner – A small amount of exposed waste noted in Phase II has been covered. Area E and C wastes from drum staging pad have been relocated to the Stage 1 cell based on sample results characterizing the waste as non-hazardous. At the request of the MOE, the area where the waste was disposed of was measured out and logged in CRA field notes. Robinson – Requested Tervita leave a clay berm at the northern access point to Stage 1 to prevent runoff.	
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** No problems were identified at this time	

Item	*Description*	*Action By*
5.	**Submittals Schedule and Status of Submittals**	
	• Tervita to submit finalized Off-Site Transportation Plan (carry over)	Tervita
	• Tervita to submit remaining gradation test results for drainage stone	Tervita
	• Tervita to submit costs for cleaning leachate pipes for CRA to develop a change order.	Tervita
6.	**Health and Safety Concerns** No health and safety concerns were identified at this time.	
7.	**Maintenance of Progress Schedule** No maintenance is required on the progress schedule at this time	
8.	**Effect of Proposed Changes on Progress Schedule and Coordination** There are no proposed changes at this time	
9.	**Contract Administration**	
	• CRA to develop RFQ for ISWMP Works	CRA
	• CRA to review Payment Certificate 7 and provide recommendation for payment	CRA
	• Tervita to submit Payment Certificate 8 for CRA review	Tervita
10.	**Other Business Relating to the Work** Butcher – Inquired about the operational status of the wells on the northern Site boundary and the one well at the eastern boundary. Also inquired if there were plans for reinstallation. Kemp – Genivar would have determined if the eastern well is still useable during the previous sampling round. The wells in the north will be reinstalled prior to the next sampling event (May 2013). Butcher – Brooks Road requires approval if the wells are to move locations. Butcher – Inquired about the status of the fencing repairs. Robertson – Contractors were here to repair fencing and install gate but the weather prevented access to the northwest area of the site. They will be returning soon to complete the repairs. Butcher – The ISWMP Works and Stage 1 waste grading/interim capping was scheduled to start in February. Is this still the case? Kemp – Weather delays have pushed the schedule back for the ISWMP and Stage 1 Works. The Works are still scheduled to be completed following waste decommissioning.

MEETING MINUTES

Reference No. 018235

PROJECT: Site Decommissioning and Stage 2A Construction

OWNER: Brooks Road Environmental c/o 2270386 Ontario Limited CONTRACT NO.: 018235 (33)

RE: Construction Progress Meeting No. 14

LOCATION: Brooks Road Landfill Site DATE: March 21, 2013 TIME: 11:00 AM

Participants:

Mark Collins (BRE)	Brad Farnand (MOE)	Paul Zizek (Tervita)	Joel Rider (Tervita)
Peter Kemp (CRA)	Dan Turner (CRA)		

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	John Beals (MOE)
		Richard Weldon (BRE)	Dan Roberts (Tervita)	Jordan Wilson (Tervita)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the March 5, 2013 Progress Meeting No. 13 were reviewed. The following items were noted: • Brad Farnand spoke with Dickson regarding the letter application for alternative daily cover. Dickson confirmed that he has the application and is aware that the approval of tarps is considered a priority for Brooks Road. Brad suggested that BRE call Dickson for an update. • Tervita has submitted the remaining gradation test results for the drainage stone. • CRA will provide Tervita with the ISWMP request for quotation by end of day. • Paul Zizek confirmed that BRE has paid Payment Certificates 7 and 8. • CRA has revised the Payment Certificate template to incorporate Change Orders 5 and 6. • Tervita has submitted Payment Certificate 9 for CRA review. • CRA is currently reviewing historical monitoring data to update the Site Monitoring Plan. • The northwestern perimeter gate has been repaired and the fence repairs are underway. • MOE requested notice of confirmatory sampling in the vicinity of TP4-2 (where waste was characterized as hazardous for lead). The waste excavation and confirmatory sampling in this area is scheduled for Monday, March 25.	BRE

Item	*Description*	*Action By*
2.	**<u>Work progress and Construction Progress Schedule</u>** Zizek – Detailed progress to date and expected completion times: - The Phase II decommissioning is 90 percent complete. Estimated to be 3 days of waste excavation remaining. - Exposing 1-metre of woven geotextile around the perimeter of the Stage 1 cell will be completed today. - Cut and fill of Stage 1 waste will be completed tomorrow. - The interim capping of Stage 1 will commence Monday and is estimated to be complete in 1 week. The packer will arrive on Monday, March 25. - Backfilling of decommissioned areas will be completed between other tasks. Turner – Noted that a confirmatory soil sample did not pass O. Reg 511/09 Table 2 standards for hot water extractable boron. This area requires further excavation and re-sampling prior to backfilling. Kemp – There is a potential for waste to be present in the right of way in the northwest corner of the Phase II Decommissioning Area. CRA has an excavation/occupation permit form to be completed prior to work in the right of way. CRA will send information to Tervita.	CRA
3.	**<u>Field Observations, Problems, and Decisions</u>** Turner – After commencing the waste excavation in the vicinity of Area A, free product was observed and CRA determined that further waste characterization was required in this area. Tervita and CRA completed test pits in the area to collect samples for waste characterization in place to minimize the handling requirements. Sample results will determine the required end location for the waste streams. All liquid waste in this area will be pumped into tanks for off-Site disposal. Collins – Some exposed waste in the Stage 2A cell in the vicinity of Tervita's work area requires cover by end of day.	
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** No problems were identified at this time	
5.	**<u>Submittals Schedule and Status of Submittals</u>** • Tervita to submit finalized Off-Site Transportation Plan (Tervita currently in discussion with CRA) • Tervita to submit costs for cleaning leachate pipes for CRA to develop a change order. Zizek noted that the inspection could be moved to a later date if the Stage 2B cell is going to be lined.	Tervita Tervita

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
6.	**Health and Safety Concerns** Turner – Work in Area A requires Level C PPE. A JSA has been prepared by Tervita and reviewed by all parties involved in work in this area.	
7.	**Maintenance of Progress Schedule** No maintenance is required on the progress schedule at this time	
8.	**Effect of Proposed Changes on Progress Schedule and Coordination** The ISWMP work will require an updated schedule. To be completed once Tervita provides a quote.	
9.	**Contract Administration** • CRA to develop an RFQ for ISWMP Works by end of day • CRA to review Payment Certificate 9 • Zizek inquired about starting an RFQ for Stage 2B work to provide more time for pricing	 CRA CRA
10.	**Other Business Relating to the Work** Rider – The silt fencing along the western boundary of the Phase II Decommissioning Area will be moved to the property boundary Farnand – Inquired about the status of the secondary containment around the Baker tanks. Collins – Richard Weldon is considering the decision to keep the Baker tanks and complete the secondary containment or remove the tanks.	
11.	**Next Meeting** April 8, 2013 at 11:00 am.

TECHNICAL MEMORANDUM

TO:	Richard Weldon (Brooks Road Environmental c/o 2270386 Ontario Limited)	REF. NO.:	018235-10
FROM:	Peter Kemp/mg/82rev3 P.K.	DATE:	January 3, 2013
CC:	Greg Ferraro		
RE:	**Updated Interim Stormwater Management Plan Brooks Road Landfill Site Haldimand County, Ontario**		

1.0 INTRODUCTION

An interim stormwater management plan (ISWMP) has been developed for the Brooks Road Landfill (Site) in response to the Ministry of the Environment (MOE) request for an ISWMP to be implemented at the Site until the permanent stormwater management plan (PSWMP) is implemented. The ISWMP has been developed to manage surface water runoff discharging from the Site through use of the approved temporary dewatering sedimentation (TDS) pond. This memo presents the ISWMP as updated to address the MOE comments received on the initial ISWMP submitted on November 28, 2012, the revised ISWMP submitted on December 14, 2012, and the revised ISWMP submitted on December 20, 2012.

Upon completion of the OLA decommissioning work, the PSWMP will be implemented commencing with the stormwater management pond in the southwest corner of the Site. The PSWMP that was approved for the Site until June 9, 2009 is provided in the approved Design and Operations Report (CRA, 2003). An application to renew the approval for the PSWMP will be submitted to the MOE Approvals Branch by March 31, 2013.

2.0 OBJECTIVES

The ISWMP for the Site has been developed in accordance with the design requirements of O. Reg. 232/98. The primary objectives of the ISWMP are to:

- Ensure that no stormwater runoff will enter the Brooks Road ditch from the Site under the worst historic regional storm scenario (Hurricane Hazel)
- Control surface water runoff from the Site into active disposal areas in order to minimize surface water contacting refuse
- Minimize potential or on-Site and sediment loading to the downstream water course

The receiving off-Site drainage courses are described in Section 4.6.2 of the approved Design and Operation Report (CRA, 2003).

3.0 DESIGN CRITERIA

The ISWMP design consists of perimeter ditches, culverts, an upgraded TDS pond, and associated works to meet the requirements of the Amended Certificate of Approval Number 8371-6X9LB, issued on February 20, 2007 (C of A). The design basis is consistent with the PSWMP contained in the approved Design and Operations Report (CRA, 2003). In the Design and Operations Report, the runoff from the final post-closure catchment areas was calculated using the hydrological model MIDUSS 4.72. In the present design the latest PCSWMM Version 5.1.1279 Professional was used to calculate the runoff using the same catchment parameters as in MIDUSS, providing approximately the same unit peak runoff and total volume per area. The catchment parameters used in the model are the contributing drainage area, catchment slope, sheet flow, length, width, Manning's 'n', percent impervious, soil infiltration rates, depression storage and the weighted Curve Number (CN) infiltration method.

The ditches and four culverts were sized to accommodate the peak flow generated from the 3-hour-duration, 25-year storm, as required by the MOE Guidelines. All drainage ditches were sized to have a 0.3-m bottom width with a minimum of a 1-meter depth and 3:1 side slopes (horizontal:vertical). The proposed culverts are designed to have a 450-mm-internal-diameter HDPE pipe with smooth internal walls. Both the ditches and culverts have the capacity to pass the Regional Storm (Hurricane Hazel) without flooding. All culvert inlets, outlets and steeply sloping channels are adequately lined with riprap and turf reinforcement mats in one location to prevent erosion.

The upgraded TDS pond was designed to meet, or exceed the requirements of the above mentioned C of A. The required pond volume was calculated to be 10,235 m^3 in order to contain the total volume of stormwater runoff under the Regional Storm to prevent any flow discharging to the adjacent Brooks Road ditch shown in Drawing C-01. A 300-mm HDPE outlet pipe was selected as an emergency overflow spillway as an added factor of safety. The pond will be lined with riprap at the two inlets to prevent any erosion. The pond internal and external side slopes are designed to have a slope of 2:1 (horizontal: vertical).

4.0 MODELING RESULTS

The upgraded TDS pond, drainage ditches, and culverts were designed based on accepted methodologies, calculations and analytical tools using PCSWMM Professional. The outputs of the model for the 25-year storm and Regional Storm are provided in Attachment 1. Seven design storms were used in the hydrological modeling as shown in Table 1. These events were based on precipitation data as provided by the Atmospheric Environmental Service, Canada. The hydrologic model was used to calculate the surface water runoff volume and peak flows for the Site.

Table 2 summarizes the model input parameters and Tables 3 and 4 present the calculated runoff volumes and peak flow rates, respectively. Table 5 presents the calculated pond performance. Drawings C-01 and C-02 show the upgraded TDS pond, culverts, and ditch layout and design details, respectively.

We trust the design as presented herein is sufficient to satisfy the MOE's request. Should you have any questions on this design or require further information, please do not hesitate to contact us.

APPENDIX C

CURRENTLY APPROVED FINAL CONTOURS CONDITION HYDROLOGIC MODEL INPUT AND OUTPUT

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model was developed
July 8 2013 - Culvert on Brooks Road was corrected as single 750mm culvert

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model was developed
July 8 2013 - Culvert on Brooks Road was corrected as single 750mm culvert

****
NOTE: The summary statistics displayed in this report are
based on results found at every computational time step,
not just on results from each reporting time step.

APPENDIX D

PROPOSED VERTICAL EXPANSION CONDITION HYDROLOGIC MODEL INPUT AND OUTPUT

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model developed
July 8 2013 - Culvert crossing on Brooks Road corrected as a single 750mm culvert

****
NOTE: The summary statistics displayed in this report are
based on results found at every computational time step,
not just on results from each reporting time step.

Total elapsed time: 00:00:09

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model developed
July 8 2013 - Culvert crossing on Brooks Road corrected as a single 750mm culvert

****

APPENDIX E

SUPPORTING DESIGN CALCULATIONS

APPENDIX E1

FOREBAY DESIGN
BROOKS ROAD LANDFILL SITE
HALDIMAND COUNTY, ONTARIO

Brooks Road Landfill Proposed SWM Pond

Design forebay For The Outlet From Outlet

Forebay Length (L)

$$L = \sqrt{\frac{r\ Q}{Vs}}$$

L = 29 m

Length to width ratio (r) =	1	:1
25mm Storm Peak flowrate (Q) =	0.258	m^3/s
Particle size settling velocity (V_s) =	0.0003	m/s

Dispersion Length (D)

$$D = \frac{8\ Q}{d\ V\ f}$$

D = 11 m

Permanent Pool Depth (d) =	0.65	m
Desired Velocity in the Forebay (V_f) =	0.5	m/s
10 year Storm Peak flow rate (Q) =	0.429	m^3/s

Minimum Forebay Bottom Width (W)

$$W = \frac{L}{8}$$

W = 4 m

Velocity Within Forebay (V)

$$V = \frac{Q}{A}$$

V = 0.056 m/s

Actual Upstream Width	4	m
Actual Downstream Width	15	m
Permanent Pool Depth =	0.65	m
Channel Side Slopes =	4	:1
Cross Sectional Area (A) =	8	m^2

Notes: 1. Design Equations are from the "*Stormwater Management Planning and Design Manual*" (MOE, 2003)

Section 1.0 Introduction

In July 2015 the Minister of the Environment and Climate Change approved the Terms of Reference (ToR) for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment (EA). This report provides an overview of the alternative conceptual vertical capacity expansion designs (i.e., 'Alternative Methods') for the Brooks Road Landfill Site Vertical Capacity Expansion EA (**Section 2.0**) and documents the following with respect to the Surface Water Resources discipline:

- Describes the Surface Water Resources Existing Conditions associated with the EA Study Areas (**Section 3.0**)
- Details the mitigation measures to be incorporated into the Alternative Method designs in order to prevent or minimize effects on Surface Water Resources (**Section 4.0**)
- Documents the net effects analysis for each Alternative Method with respect to Surface Water Resources (**Section 5.0**)
- Identifies the Preferred Alternative Method from a Surface Water Resources perspective through a comparative evaluation process (**Section 6.0**)

Section 2.0 Alternative Methods for Vertical Expansion

Three vertical expansion alternatives have been developed for comparative analysis. The alternatives were identified in consideration of the criteria and assumptions outlined in the Conceptual Design Report (CDR) and based on public input received during the ToR.

The following aspects will be identical across all three vertical expansion alternatives, including:

- An expansion capacity of 421,000 m^3, including waste, daily cover, and interim cover
- The limit of waste (i.e., landfill footprint)
- Traffic associated with importing waste, daily cover, and interim cover
- The location of the site entrance, scalehouse, and other ancillary supporting features
- The size and location of all buffer areas
- The final cover design (0.6 m of compacted fine-grained soil overlain by a 0.15 m thick vegetative layer)
- The leachate treatment (i.e., batch leachate treatment system)

The three vertical expansion alternatives are illustrated on **Drawings C-02** through **C-07** (following text) and their unique attributes are outlined in **Table 2.1**, below. Further information on the vertical expansion alternatives is found in the CDR.

Table 2.1 Comparison of Vertical Expansion Options			
Attribute	**Alternative 1**	**Alternative 2**	**Alternative 3**
General Description	Expansion capacity with 3H to 1V (33%) side slopes to a crest height of 218.075 m	Expansion capacity with 4H to 1V (25%) side slopes to a crest height of 221.0 m	Expansion capacity with 3H to 1V (33%) side slopes to a crest height of 221.25 m and bench at approx. 210.0 m
Approximate Elevation of Top of Landfill (including final cover)	219.65 m	221.50 m	222.13 m
Approximate Height of Landfill Above Existing Grade of 198.96	20.69 m	22.54 m	23.17 m
Post-Closure Leachate Generation Rate	36 m^3/day	36 m^3/day	36 m^3/day
Number of Vehicles Per Day Associated with Waste and Construction Materials	16	16	16

Section 3.0 Surface Water Resources Environment Potentially Affected

The July 2015 Minister-approved ToR includes a preliminary description of the existing environmental conditions within the Study Areas and commits to providing an expanded description of the existing environmental conditions within the Study Areas in the EA. The following section provides a more detailed description and understanding of the Surface Water Resources Existing Conditions within the Study Areas for use in the assessment and evaluation of Alternative Methods.

3.1 Study Areas

The following two generic study areas were established for preparation of the EA:

- **Site Study Area**, including all lands (i.e., 14.3 hectares (ha)) within the existing, approved boundaries of the Brooks Road Landfill Site (Site), as defined by Environmental Compliance Approval (ECA) No. A110302, dated July 21, 2014, as amended
- **Local Study Area**, including all lands and waters within a 1 kilometre (km) radius of the Site Study Area boundaries including agricultural, residential, and municipal properties

As provided for in the approved ToR, each technical discipline may modify the Local Study Area, as required, during the EA. For Surface Water Resources both the Site and Local Study Areas are applicable (see **Figure 3.1**).

3.2 Methodology

Information on the Surface Water Resources Existing Conditions within the Study Areas was gathered from a combination of primary and secondary source research as well as field investigations.

3.2.1 Available Secondary Source Information Collection and Review

The following information was reviewed:

- 2015 Operations & Monitoring Report, Brooks Road Landfill, prepared by Conestoga-Rovers & Associates Ltd. , dated April 2016.
- Scoped Environmental Impact Study, Former Railway Corridor Lands, North of Brooks Road Landfill, Haldimand County, ON, dated December 2013.
- Stormwater Management Plan, prepared by Conestoga-Rovers & Associates Ltd., dated September 2013.
- Amended Environmental Compliance Approval Number 6869-9EAT28, for establishment of a stormwater management facility and a leachate collection, treatment, and disposal system, and issued by the Ministry of the Environment, dated November 12, 2014.
- Application for Amendment to Environmental Compliance Approval for Stormwater Management Plan, prepared by Conestoga-Rovers & Associates Ltd., dated September 11, 2013.
- Stage 3B and Final Stormwater Pond Construction Drawings, prepared by Conestoga-Rovers & Associates Ltd., dated May 2014.
- Amphibian monitoring, Edwards Landfill Monitoring Report, prepared by Natural Resource Solutions Inc., dated May 22, 2007.
- Application for Approval of Industrial Sewage Works – Ontario Water Resources Act, Surface Water Management Plan, prepared by Conestoga-Rovers & Associates, dated February 9, 2004.
- Natural Heritage Features Assessment, prepared by Natural Resource Solutions Inc., dated December 2004.
- Monitoring Program Review and Comments, issued by the Ministry of Natural Resources, in a letter dated May 28, 2007.
- Preliminary Surface Water Assessment, Edwards Landfill Site, prepared by Conestoga-Rovers & Associates, dated November 2001.

3.2.2 Field Investigations

Regular surface water field investigations are completed four times annually. During the 2015 monitoring period, field investigations were conducted on March 19, 2015, May 23, 2015, August 4, 2015, and November 12, 2015.

The field investigations include monitoring of surface water quality and quantity, through water sampling and flow rate measurements. Additionally, any characteristic changes to drainage patterns, run-off, or features influencing site conditions are also identified.

3.3 Existing Surface Water Resources Conditions

The on-Site drainage patterns have changed considerably since the documentation from early 2001 to 2007. Surface water management appears to be a key control at the Site. The Site stormwater management practices currently operate under amended ECA No. 6869-9EAT28, issued in November 2014. The Site drainage network is being configured to the Post Closure Condition, illustrated on Figure 2 of the 2013 Stormwater Management Plan (see **Appendix A**).

The Local Study Area includes slough forest, woodlot, agricultural, residential, and municipal properties. The on-Site topography is very flat with a slight 0.003 metre/metre (m/m) horizontal gradient to the south. The topography across the Local Study Area from north to south ranges from approximately 202 metre above mean seal level (m AMSL) to approximately 196 m AMSL.

As indicated in the 2013 Stormwater Management Plan, the stormwater management system for the Site was designed to provide water quality and water quantity control of surface water runoff. The design criteria is designed to attenuate peak flows up to the 100-year storm event. The drainage ditches were further sized, at a minimum, to accommodate the peak flow from a 3-hour duration, 25-year storm. The current design for the Site includes two outfalls (Outfall 1 and Outfall 2). Outfall 1 is characterized as an undeveloped area of land on the south-east corner of the Site where no work or changes are being proposed. Precipitation that falls in Outfall 1 will be absorbed by the biota and/or conveyed off-Site to the South. Outfall 2 combines the remainder of the Site area, including run-off from the landfill cap. Prior to discharge, Outfall 2 surface water will be collected in an extended detention wet stormwater management pond. The stormwater management pond has been designed with additional capacity for the proposed vertical expansion of the landfill. The discharge point for Outfall 2 is to the Brooks Road ditch near the south-west corner of the Site.

Although the Site is on the boundary of two watersheds and the conditions are primarily ephemeral, the surface water drainage pattern meanders through road-side ditches, farm land, and Norton's Creek to the Grand River, located approximately 7 km from the Site.

As shown on **Figure 3.2**, the surface water monitoring network is currently comprised of eight monitoring locations, and consists of two background monitoring locations, two on-Site monitoring locations, and four downstream monitoring locations.

SURFACE WATER MONITORING LOCATIONS
SURFACE WATER RESOURCES ASSESSMENT REPORT
BROOKS ROAD LANDFILL SITE
160 Brooks Road, Cayuga, Ontario

Legend

- Surface Water Monitoring Location
- Site Location
- Local Study Area (1km Radius)

018235-20(067)GIS-WA001 Apr 21/2016

The background monitoring locations are typically characterized by concentrations of phosphorus, aluminum, and iron that have consistently been reported above the Provincial Water Quality Objectives (PWQO). Other parameters that have been occasionally detected at concentrations elevated above their respective PWQO's include: phenolics, chromium, cobalt, copper, vanadium, zinc, toluene, and some PAH parameters.

Recent water quality results obtained from on-Site surface water monitoring locations are generally consistent with background surface water monitoring locations. One of the on-Site surface water monitoring locations (SW5) has historically reported elevated lead and PAH concentrations. The elevated lead and PAH concentrations were previously interpreted to be the result of an historic railway ballast stockpile located in the catchment area.

Surface water quality results for SW3, located immediately downstream of the Site within the Brooks Road ditch, have consistently been reported to contain elevated concentrations of some PAH parameters. The elevated PAH results at SW3 have previously been interpreted to have resulted from poor handling of railway ballast materials.

Downstream water quality is generally consistent with background water quality results and demonstrates an improvement from SW3.

Section 4.0 Mitigation Measures to be Incorporated into the Alternative Method Designs

Based on the description of the Alternative Methods provided in **Section 2.0** and the characterization of Surface Water Resources Existing Conditions within the Study Areas described in **Section 3.0**, **Table 4.1** presents the mitigation measures recommended to be incorporated into the Alternative Methods designs in order to avoid or minimize impacts on Surface Water Resources.

Table 4.1 Mitigation Measures to be Incorporated into the Design

	Recommended Design Mitigation Measure	***Resulting Net Effect***
Alternative Method 1	Extended detention wet stormwater management pond, as previously designed in the Stormwater Management Plan prepared by GHD (September 2013)	No net environmental effect
Alternative Method 2	Extended detention wet stormwater management pond, as previously designed in the Stormwater Management Plan prepared by GHD (September 2013)	No net environmental effect
Alternative Method 3	Extended detention wet stormwater management pond, as previously designed in the Stormwater Management Plan prepared by GHD (September 2013)	No net environmental effect

Section 5.0 Net Effects Assessment

This section documents the net effects assessment for the Alternative Methods for the Brooks Road Landfill Site Vertical Capacity Expansion EA from a Surface Water Resources perspective.

5.1 Net Effects Assessment Methodology

The assessment of the Alternative Methods was conducted in two steps:

- **Step 1: Confirm Evaluation Criteria and Indicators/Measures**
  Prior to undertaking the net effects assessment, the Surface Water Resources evaluation criteria, indicators, and measures developed in the Minister approved ToR were reviewed and confirmed for application to each of the Alternative Methods.
- **Step 2: Undertake the Net Effects Analysis**
  With the evaluation criteria, indicators and measures confirmed through the preceding step, a net effects analysis of the Alternative Methods was carried out consisting of the following activities:
  - Identify potential effects (based on measures) on the Surface Water Resources
  - Develop and apply avoidance/mitigation/compensation/enhancement measures
  - Determine net effects on the environment

5.2 General Assumptions

For the following analysis, the following assumptions have been made:

- The landfill cap will be vegetated and no pollutants of any kind (i.e., pesticides, herbicides, fertilizers) will be applied to the cap once it has been fully vegetated
- Only areas on the landfill cap are changing, no other area of the landfill will change slopes or have its drainage significantly re-configured in any way
- No surface water will ever come in contact with waste. Any surface water that infiltrates through the cap will be captured by the leachate collection system and treated
- There will be no leachate seeps or exchange of surface water and leachate

5.3 Criteria/Indicators

The evaluation criteria, indicators, rationale and data sources for the Surface Water Resources environmental component are shown below.

	Environmental Component	Evaluation Criteria	Study Area	Indicators	Rationale	Data Sources
NATURAL	Surface Water Resources	Surface water quality	Site & Local Study Areas	• Predicted effects on surface water quality on-site and off-site	Contaminants associated with waste disposal sites have the potential to seep or runoff into surface water.	• Topographic maps • Air photos • Facility layout, drainage maps and figures • Proposed on-site stormwater management concept designs for vertical expansion alternatives • Existing leachate management system • Annual monitoring reports • Interviews and discussions with staff, MOE, Conservation Authorities, and Environment Canada • Published water quality and flow information from MOE, Environment Canada and conservation authorities • Site reconnaissance • PWQMN
		Surface water quantity	Site & Local Study Areas	• Change in drainage areas • Predicted occurrence and degree of off-site effects	The construction of physical works may disrupt natural surface drainage patterns and may alter runoff and peak flows. The presence of the facility may also affect base flow to surface water.	

5.4 Potential Environmental Effects

5.4.1 Alternative Method 1

Potential effects on surface water quality are:

- Increased erosion/soil loss due to steeper slopes

Based on the Universal Soil Loss Equation (USLE), an increased slope would lead to increased soil loss due to erosion. The increase is soil loss would be minor as slope is only one of numerous factors that affect soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of Total Suspended Solids (TSS) and TSS related pollutants (e.g. metals entrained in the soil).

Potential effects on surface water quantity are:

- Increased runoff peak flows due to a steeper slope
- Increased runoff volumes due to a steeper slope

Based on hydrologic modelling completed in the Stormwater Management Plan report for Alternative Method 2 there is no significant increase in runoff peak flow rates or volumes with steeper landfill slopes. Although the modeling was performed based on the design for Alternative Method 2, it is expected that the results for the steeper slopes of Alternative Method 1 would be similar.

5.4.2 Alternative Method 2

Potential effects on surface water quality are:

- Increased erosion/soil loss due to steeper slopes

Based on the USLE, an increased slope would lead to increased soil loss due to erosion. The increase is soil loss would be minor as slope is only one of numerous factors that affect soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of TSS and TSS related pollutants (e.g., metals entrained in the soil).

Potential effects on surface water quantity are:

- Increased runoff peak flows due to a steeper slope
- Increased runoff volumes due to a steeper slope

Based on hydrologic modelling completed in the Stormwater Management Plan report for Alternative Method 2 there is no significant increase in runoff peak flow rates or volumes with steeper landfill slopes.

5.4.3 Alternative Method 3

Potential effects on surface water quality are:

- Increased erosion/soil loss due to steeper slopes

Based on the USLE, an increased slope would lead to increased soil loss due to erosion. The increase is soil loss would be minor as slope is only one of numerous factors that affect soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of TSS and TSS related pollutants (e.g., metals entrained in the soil).

Potential effects on surface water quantity are:

- Increased runoff peak flows due to a steeper slope
- Increased runoff volumes due to a steeper slope

Based on hydrologic modelling completed in the Stormwater Management Plan report for Alternative Method 2 there is no significant increase in runoff peak flow rates or volumes with steeper landfill slopes. Although the modeling was performed based on the design for Alternative Method 2, it is expected that the results for the steeper slopes of Alternative Method 3 would be similar.

5.5 Mitigation Measures Beyond Those Incorporated into the Design

5.5.1 Alternative Method 1

To mitigate the effects of an increase in runoff TSS concentrations and peak flow rates, an extended detention wet stormwater management pond was designed. The stormwater management pond was designed based on Alternative Method 2, which is expected to have similar runoff TSS concentrations and peak flows as Alternative Method 1. Since the stormwater management pond has already been designed to mitigate the effects of Alternative Method 2, no additional mitigation measures are needed beyond those incorporated into the design.

5.5.2 Alternative Method 2

To mitigate the effects of an increase in runoff TSS concentrations and peak flow rates, an extended detention wet stormwater management pond was designed. The stormwater management pond was designed based on Alternative Method 2. Since the stormwater management pond has already been designed to mitigate the effects of Alternative Method 2, no additional mitigation measures are needed beyond those incorporated into the design.

5.5.3 Alternative Method 3

To mitigate the effects of an increase in runoff TSS concentrations and peak flow rates, a an extended detention wet stormwater management pond was designed. The stormwater management pond was designed based on Alternative Method 2, which is expected to have similar runoff TSS concentrations and peak flows as Alternative Method 3. Since the stormwater management pond has already been designed to mitigate the effects of Alternative Method 2, no additional mitigation measures are needed beyond those incorporated into the design.

5.6 Net Environmental Effects

5.6.1 Alternative Method 1

The stormwater management pond, as designed, will mitigate all water quality and quantity effects, and no net environmental effect is expected.

5.6.2 Alternative Method 2

The stormwater management pond, as designed, will mitigate all water quality and quantity effects, and no net environmental effect is expected.

5.6.3 Alternative Method 3

The stormwater management pond, as designed, will mitigate all water quality and quantity effects, and no net environmental effect is expected.

Table 5.1 Alternative Method 1 Surface Water Resources Potential Environmental Effects, Mitigation Measures & Net Effects						
	Environmental Component	**Evaluation Criteria**	**Indicator**	**Potential Effects**	**Mitigation Measures**	**Net Effects**
Natural	Surface Water Resources	Surface Water Quality	Predicted effects on surface water quality on-site and off-site	Based on the USLE, an increased slope would lead to increased soil loss due to erosion. The increase in soil loss would be minor as slope is only one of numerous factors that affect soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of TSS and TSS related pollutants.	No specific mitigation measures required beyond the continued operation of the stormwater management pond to remove the excess TSS.	No effects on surface water quality on-site or off-site.
		Surface Water Quantity	Change in drainage areas	Hydrologic modelling completed in the Stormwater Management Plan report for Alternative Method 2 shows no significant increases in runoff peak flow rates or volumes for Alternative Method 2 compared to currently approved final closure conditions. Although the slopes for Alternative Method 1 are steeper, the effect on peak flows and runoff volumes is expected to be negligible.	No specific mitigation measures required beyond the continued operation of the stormwater management pond to attenuate peak flows.	No change in drainage areas.
			Predicted occurrence and degree of off-site effects	Hydrologic modelling completed in the Stormwater Management Plan report shows that for Alternative Method 2 the stormwater management pond will attenuate runoff peak flow rates for all storm events modelled. The expected peak flows and runoff volumes for Alternative Method 1 are expected to be the same as Alternative Method 2, therefore the pond will attenuate peak flows in the same way.	No specific mitigation measures required beyond the continued operation of the stormwater management pond to attenuate peak flows to protect downstream receivers from potential changes in water quantity.	No off-site effects to surface water quantity.

Table 5.2 Alternative Method 2 Surface Water Resources Potential Environmental Effects, Mitigation Measures & Net Effects

No specific mitigation measures required beyond the continued operation of the stormwater management pond to attenuate peak flows to protect downstream receivers from potential changes in water quantity.	No off-site effects to surface water quantity.

Section 6.0 Comparative Evaluation

This section documents the comparative evaluation of the Alternative Methods from a Surface Water Resources perspective based on the net environmental effects identified in **Section 5.0**.

6.1 Comparative Evaluation Methodology

The Minister approved ToR states that the comparative evaluation of the Alternative Methods will be carried out using a Reasoned Argument (or Trade-off) method, with evaluation criteria as the basis for comparison. Under the Reasoned Argument approach, the differences in the net effects associated with each Alternative Method are highlighted. Based on these differences, the advantages and disadvantages of each alternative can be identified according to the evaluation of trade-offs between the various evaluation criteria and indicators. The relative significance of potential impacts is then examined to provide a clear rationale for the selection of a preferred alternative from a Surface Water Resources perspective. The term *trade-offs* is defined as "*things of value given up in order to gain different things of value*". Each Alternative Method will be compared against the others to distinguish relative differences in impacts to the environment, taking into account possible mitigation measures.

6.2 Comparative Evaluation Results

Based on the results of the comparative evaluation in **Table 6.1**, all three alternative methods are equal in causing no net environmental effect.

Table 6.1 Surface Water Resources Comparative Evaluation

	Environmental Component	Evaluation Criteria	Indicator	Alternative Method 1 Net Effects	Alternative Method 2 Net Effects	Alternative Method 3 Net Effects
NATURAL	Surface Water Resources	Surface Water Quality	Predicted effects on surface water quality on-site and offsite	No effects on surface water quality on-site or off-site. **NO NET EFFECTS**	No effects on surface water quality on-site or off-site. **NO NET EFFECTS**	No effects on surface water quality on-site or off-site. **NO NET EFFECTS**
			Criteria Ranking:	**Tied for 1st**	**Tied for 1st**	**Tied for 1st**
			Criteria Rationale:	No on-site or off-site effects on surface water quality associated with any of the three alternative methods.		
		Surface Water Quantity	Change in drainage areas	No change in drainage areas. **NO NET EFFECTS**	No change in drainage areas. **NO NET EFFECTS**	No change in drainage areas. **NO NET EFFECTS**
			Predicted occurrence and degree of off-site effects	No off-site effects to surface water quantity. **NO NET EFFECTS**	No off-site effects to surface water quantity. **NO NET EFFECTS**	No off-site effects to surface water quantity. **NO NET EFFECTS**
			Criteria Ranking:	**Tied for 1st**	**Tied for 1st**	**Tied for 1st**
			Criteria Rationale:	No effects on surface water quantity associated with any of the three alternative methods.		
		Environmental Component Ranking:		**Tied for 1st**	**Tied for 1st**	**Tied for 1st**
	RATIONALE			All three alternative methods have no net effect with respect to surface water quality and quantity		

Section 7.0 Conclusion

As indicated in the 2013 Stormwater Management Plan, the stormwater management system for the existing Site was designed to provide water quality and water quantity control of surface water runoff. The stormwater management pond has been designed with additional capacity for the proposed vertical expansion of the landfill.

All three alternatives may result in increased erosion/soil loss, runoff peak flow rates and/or runoff volumes due to steeper slopes. The increase is soil loss would be minor as slope is only one of numerous factors that affect soil loss. The erosion would show up in stormwater runoff as slightly increased concentrations of TSS and TSS related pollutants (e.g., metals entrained in the soil). Based on hydrologic modelling completed in the Stormwater Management Plan report there is no significant increase in runoff peak flow rates or volumes with steeper landfill slopes.

No mitigation measures beyond those incorporated into the design are recommended for any of the alternative methods.

Based on the preceding evaluation, each of the three alternative methods proposed is equal in that none of them are anticipated to affect surface water quality or quantity for downstream receivers.

1.0 INTRODUCTION

This report, prepared by Conestoga-Rovers & Associates Limited (CRA) on behalf of Brooks Road Environmental c/o 2270386 Ontario Limited (BRE) (Owner, Proponent), presents the Stormwater Management Plan (SWM Plan) for the Brooks Road Landfill (Site) located at 160 Brooks Road in Cayuga, Haldimand County, Ontario. The Site is legally described as Part of Lot 24, Concession I-N.T.R., of the former North Cayuga Township, former Regional Municipality of Haldimand-Norfolk, and now Haldimand County. A Site location map is provided on Figure 1.

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (dated May 5, 2004), has an approved fill rate of 500 tonnes per day and a capacity of 624,065 m^3 (including waste, daily cover and interim cover). The Site was originally approved as a local landfill site in 1971, with amendments approved by the Ministry of the Environment (MOE) in 1974, 1979, 2002, 2004, 2005, 2007, 2011, 2012, and 2013.

The Site also operates under an amended Industrial Sewage Works Certificate of Approval Number 8371-6X9L6B (dated February 20, 2007) for the conveyance and discharge of stormwater runoff and leachate collection and disposal system.

The purpose of this report is to present an updated SWM Plan for the Site that is consistent with the current landfill design. The SWM Plan has been completed to support an application for an amended ECA for Industrial Sewage Works for the Site. CRA has reviewed the available background information, current landfill design, and conducted consultation with the MOE to obtain a full understanding of the work required.

This report does not address any changes to the leachate collection and disposal system. The Owner submitted an application to amend the design and operation of the leachate collection and disposal system. This application was submitted on March 16, 2013 (MOE Reference #5565-967NGT).

The SWM Plan was developed with reference to the Ontario Ministry of the Environment (MOE) Storm Water Management Planning and Design Manual (dated March 2003) and other applicable guidance documents.

1.1 PRELIMINARY CONSULTATION

Prior to the completion of the designs for SWM works on Site, CRA met with the MOE for pre-application consultation at a number of on-Site biweekly progress meetings for the Site Decommissioning and Stage 2A Construction project. Copies of the meeting minutes are included in Appendix A.

2.0 SITE BACKGROUND

2.1 SITE LOCATION

The Site is licensed to receive waste from all of Ontario but receives most of its post-diversion Industrial, Commercial, Institutional (IC&I) solid non-hazardous waste from within Haldimand County. The 12.4 hectares (ha) Site contains an approved fill area of approximately 6.07 ha.

The Site is irregular in shape and is located in a predominantly undeveloped area. The Site is currently surrounded by:

- Undeveloped land to the north. The former Canadian Southern Railway right-of-way directly to the north was purchased by the Owner in 2003 and has been utilized as a clean clay stockpile area since 2005
- Brooks Road to the west, and beyond by undeveloped and cultivated land
- Undeveloped and cultivated land to the south and east

This Site is not located in an area of development as defined by the Niagara Escarpment Planning and Development Act (NEPDA) and is not located on the Oak Ridges Moraine Conservation Area as defined by the Oak Ridges Moraine Conservation Plan (ORMCP).

2.2 SITE SETTING

The geographic, geologic, and hydrogeologic framework for the Site and surrounding area have been previously described in a report entitled Hydrogeologic Performance Assessment (dated October 2002), prepared by CRA. The previously reported information regarding the Site setting is summarized in the following sections.

Site Topography and Drainage

The Site is located within the Haldimand Clay Plain which is characterized by level topography and relatively poor drainage. The Site is located within jurisdiction of the Grand River Conservation Authority. The Site ultimately discharges runoff to the roadside ditch along the east side of Brooks Road which drains in a southerly direction through a culvert under the Canadian National Railway rail bed and empties into a small apparently natural stream channel which is the head waters of Norton Creek. Other drainage from adjacent lands to the west of Brooks Road also flows in culverts under Brooks Road to provide surface runoff to Norton Creek. Other surface runoff contributions include ephemeral streams on lands south of the Site that enter Norton Creek via culverts under the CNR rail bed. Norton Creek discharges directly to the Grand River.

Site Geology

The overburden geology is relatively uniform beneath the Site. In general the Site is characterized by a thick (14 to 18 m) glaciolacustrine layer of stratified silty clay, silty clay till and varied clays, underlain by a thin (1 to 3 m) discontinuous layer of silty sand till with varying concentrations of gravel and clay. The bedrock is encountered at depths varying from 15.2 to 20.2 m bgs. A thin surficial deposit of topsoil is generally observed at the surface of the Site, with the exception of the southwestern portion, where refuse associated with historical waste disposal activities in the original landfill area (OLA) was observed.

The decommissioning of the OLA commenced in August 2012 and was completed in early July 2013. The decommissioned area was backfilled using on-Site native silty clay and graded to facilitate drainage.

The silty clay deposits are described as being locally fractured (weathered) from the surface down to depths varying from 3 to 5 m bgs, and are characterized as a very stiff to hard unit with low plasticity. At depths in excess of 5 m, the silty clay deposits have little to no fracturing and the consistency of the units decrease to stiff to very stiff.

Underlying the silty clay deposits, a thin discontinuous silty sand till with varying concentration of clay and gravel is encountered across the Site. The silty sand till ranges in thickness from 1 to 3 m and often contains cobbles and/or broken angular bedrock fragments. This deposit is usually well graded with fine to medium grained sand, minor silt and trace clay, and is described as dense to compact, grey and saturated. The silty sand till rests directly over the bedrock.

Bedrock underlying the Site has been described as a fractured shale, dolostone and gypsum of the Salina Formation. The top of bedrock elevation ranges from 180.80 to 185.73 m above mean sea level (AMSL), and forms a small bedrock valley from northwest to southeast across the Site. The small depression is characterized by the thicker silty sand till deposit. Regionally the bedrock topography dips to the south.

Site Hydrogeology

In general, the geologic units identified at the Site have been grouped into two main hydrogeologic units, as follows:

i) An unconfined water table (shallow overburden) unit within the permeable refuse in the OLA and the shallow fractured silty clay (weathered) unit

ii) A confined deep overburden/shallow bedrock aquifer

The shallow overburden unit is essentially a perched water table resting on the impermeable un-weathered clay units. The large variation in hydraulic conductivity between the refuse material and the surrounding silty clay explains the groundwater mounding effect historically observed in the OLA. Now that the waste within the OLA has been decommissioned and the area has been backfilled with silty clay, the shallow overburden unit mound has been effectively removed from the Site. Historically, these two hydrogeological units were separated by a thick (between 9 and 12 m) layer of stratified silty clay, silty clay till, and varied clays which forms an aquitard of very low hydraulic conductivity. Groundwater level data historically gathered from the shallow overburden unit and deeper overburden/shallow bedrock aquifer indicate that the presence of the clay aquitard results in hydraulic separation of the two units. A water head varying from 9.5 to 15 m has been historically measured at the location of nested wells.

Underlying the silty clay aquitard, a confined deep overburden/shallow bedrock aquifer was observed within the lower portion of the silty sand till unit and the shallow fractured bedrock. Groundwater quality and water level data historically gathered from monitoring wells screened within the lower silty sand till unit exhibited similar hydrostatic levels and hydrochemical characteristics which are not substantially different from samples obtained from well nests screened solely with the shallow bedrock. Therefore these two geological units have been generally considered to form one aquifer.

Based on the groundwater data obtained to date, the deep overburden/shallow bedrock aquifer is generally encountered at depths varying from 14 to 17 m bgs. The groundwater flow pattern of this aquifer is generally characterized by a weak gradient and a southerly flow.

2.3 EXISTING SITE CONDITIONS

The existing Site topography (based on the March 2013 topographical survey data) and ancillary features are presented on Drawing 2. The Site works and development currently consists of the following:

- Site Support and Staging Area with a scale and multiple trailers for office staff and storage.
- The landfill is being constructed in three distinct stages named as: Stage 1, Stage 2, Stage 3 and are described as follows:
  - Stage 1 cell construction commenced in December 2006 and was completed in October 2007. The Stage 1 landfill area has an interim cap constructed as per the approved Design and Operations Report (D&O), dated November 2003.
  - Currently Stage 2 has been excavated and approximately 2/3 of the cell has been constructed and lined. The completed portion has been designated as Stage 2A. Stage 2A is currently accepting landfill waste and Stage 2B/3A will be constructed in the future.
  - The Site design provides for three disposal stages that will be constructed in a progressive manner from east (Stage 1) to west (Stage 3). Further information concerning the detailed design of the landfill is provided within the approved D&O.
- The decommissioning of the OLA was completed in early July 2013. This included:
  - The removal of all refuse within the OLA
  - The removal of all impounded water and leachate within the OLA
  - Backfilling of the OLA to match adjacent topography
  - Grading of the OLA to provide adequate drainage
- A series of temporary dewatering sedimentation ponds (TDS Ponds) have been constructed to collect existing Site runoff. The ponds operate in a closed position whereby stormwater is pumped from the ponds to the roadside ditch after water samples meet the trigger parameter requirements detailed in the current Industrial Sewage C of A number 8371-6X9L6B

- A swampy area is located in the south-east corner of the Site. No work is proposed within this area. The area has a relatively small contributing drainage area with no apparent discharge location.
- A series of visual screening berms which also serve to divide site runoff constructed as per the approved D&O Plan

Stormwater runoff from the active landfilling area is collected within the landfill cell as leachate where it is eventually pumped into tankers for off-Site disposal. Stormwater runoff from the capped portion of the Stage 1 landfill cell is directed to the TDS ponds. Stormwater collected to the west of Stage 2A, within the future landfill cell excavation, is manually pumped to the TDS ponds. The surrounding area sheet flows from the Site, ultimately discharging to the east ditch along Brooks Road which forms the headwaters of four areas, identified as Outfall 1 and 2 on Drawing 2.

2.4 REGULATORY SETTING

The landfill currently operates as a waste disposal facility under Permit Number A110302. The D&O for the landfill was originally completed in November 2003. The approved final contours presented in the D&O were updated by Genivar Inc. and approved by the MOE in June 2012.

The Site also operates under an amended Industrial Sewage Works Certificate of Approval Number 8371-6X9L6B (dated February 20, 2007) for the conveyance and discharge of stormwater runoff and leachate collection and disposal system. The Permit is based upon a SWM Plan and subsequent correspondence submitted by CRA in February 2004. This report formed the basis for establishing accepted limits for the total peak runoff discharge from the Site for various rainfall events identified as the Existing Conditions within the original Plan.

At the request of the MOE, an Interim Stormwater Management Plan (ISWMP) was prepared for the Site in January 2012. The purpose of the ISWMP was to improve the existing stormwater management system and increase the overall capacity of the temporary dewatering sedimentation pond (TDS pond). The ISWMP was approved by the MOE on January 3, 2013 and is scheduled for completion in 2013.

The Site is currently at the early stages of completing an individual Environmental Assessment (EA) related to a proposed vertical expansion of the landfill. The vertical capacity expansion being proposed will be for approximately 421,000 m^3 (including waste, daily cover and final cover) of additional capacity, which will be achieved

through a re-engineering of the Site's final contours. The revision of final contours proposed under the EA will also require some redesign of the approved on-Site stormwater management system (due to altered waste slopes). The proposed final contours were considered in this report to prevent the need to revise the stormwater works in the future should the final contours be approved. All changes considered herein will occur within the Site's existing waste footprint and Site boundaries.

3.0 PROPOSED SITE CONDITIONS

3.1 GENERAL DESCRIPTION

The Site development is generally consistent with the original D&O report with respect to the handling and discharge of runoff. The differences between the existing C of A and the Site conditions described below are due to changes in the final contours or topography of the landfill area.

This report provides an updated SWM Plan that considers recent changes to the landfill design. The following three conditions have been assessed:

1. Interim Condition which considers the most recent upgrades to the stormwater conveyance system (ditches, culverts) and modifications to the existing TDS pond.
2. Currently Approved Post Closure Condition which considers the most recently approved post-closure grading plan.
3. Proposed Vertical Expansion Condition which considers the proposed closure plan, currently undergoing an individual EA.

Design drawings have been prepared to support the stormwater management system for the Interim, Currently Approved, and Proposed Vertical Expansion Conditions. These design drawings have been bound separately to this report and comprise a select number of drawings of the larger Design and Operations Plans for the Site.

3.2 DESIGN CRITERIA

The stormwater management system for the Site was designed to provide water quality and water quantity control of surface water runoff. Water quality treatment will be provided through extended detention of the 4-hour duration 25 mm storm event. The stormwater management pond is proposed to provide water quantity control for all storm events up to the 100-year storm, via attenuation of peak flows to below the Existing Condition, as outlined within the original SWM Plan. Estimated runoff from the Regional Storm (Hurricane Hazel) has been assessed to demonstrate safe passage to downstream receivers.

At a minimum, internal drainage ditches were sized to accommodate the peak flow generated from the 3-hour duration 25-year storm, as required by the MOE Guidelines.

3.3 INTERIM CONDITION STORMWATER MANAGEMENT SYSTEM

The MOE requested the ISWMP be developed for the Site. This plan was developed within the CRA technical memo dated January 3, 2013 and consisted of improvements in collecting and routing runoff from the capped portion of the landfill, around the active landfill area, towards the TDS Pond. The ISWMP also consisted of an expansion to the TDS Pond. The ISWMP technical memo has been provided as Appendix B.

Construction activities associated with the ISWMP are scheduled to be completed in September 2013.

3.4 CURRENTLY APPROVED POST CLOSURE CONDITION

The currently approved post-closure Site plan is presented on Drawing 5. Site runoff is discharged from two outfalls located at the Site. Runoff discharging towards Outfall 1 is characterized as an undeveloped area of land in the south-east corner of the Site where no work or changes are being proposed. The remainder of the Site area is directed towards Outfall 2. This SWM Plan provides engineered design for stormwater runoff collected and discharged to Outfall 2, upon final closure of the landfill.

The proposed final layout includes a fully capped landfill with a final cover that consists of a 0.6 m thick soil cover overlain with a 0.15 m topsoil layer and a vegetative cover. The soil cover will consist of on-Site material and/or imported material to provide a cover that will allow a minimum infiltration rate of 0.15 m per year in accordance with O. Reg. 232/98 for an engineered site. The topsoil used in final cover construction will be obtained from on-Site areas stripped in preparation for landfill construction. Runoff generated from the landfill will be collected within a perimeter ditch and directed towards a stormwater management pond (SWM Pond). The SWM Pond has an outlet structure to attenuate peak flows and an emergency spillway to convey excess runoff off-Site during larger storm events. The SWM Pond ultimately discharges towards Outfall 2 which discharges into a roadside drainage ditch along the east side of Brooks Road.

The drainage boundaries for the currently approved post-closure condition are presented on Figure 2. Figure 3 presents the flow schematic for the proposed conditions and illustrates how each catchment is routed to Outfall 1 and Outfall 2.

Catchment 100 will remain undeveloped with the exception of a small portion of the access roads which bound the north and west part of this catchment. This catchment has

sufficient internal storage capacity to retain all surface water runoff resulting from the Regional storm event. Catchment 100 discharges towards Outfall 1 (the swampy area).

Catchments Series 200 (201 through to 210) discharge to the SWM Pond. Catchments 201, 202, 203 and 204 represent the currently approved post-closure landfill cap area. The landfill cap area is encompassed with a perimeter ditch that drains in two directions from the northeast corner of the landfill, to the southwest corner of the landfill. Catchments 201, 202, 203, and 204 drain to the north, west, east and south side perimeter ditches respectively. From the southwest corner of the landfill, the perimeter ditch drains through two 600 mm diameter culvert and an open ditch to the stormwater management pond. Catchment 205 and 206 encompass the area between the landfill perimeter access road and the visual screening berms to the north and west. Catchment 205 and 206 will drain directly to the stormwater management pond via perimeter ditches along the north and west side of the access road. Catchment 207 and 208 encompass the Segregated Recyclable Material Storage Area, Site trailers and scales. This area is a gravel parking lot with numerous bins, trailers, and a weigh scale. This area will sheet flow to the north and runoff will be collected by a drainage ditch that discharges to the SWM Pond. Catchment 209 and 210 encompass the SWM Pond and small undeveloped area east of the SWM Pond. The pond will discharge to the southwest and towards the drainage ditch along Brooks Road which outlets off-Site, known as Outfall 2.

Catchment 301 will also remain undeveloped with the exception of that portion of the visual screening berm that bounds the catchment to the west. Construction of the berm will have an insignificant impact on flows from this catchment.

Catchment 302 will remain largely undeveloped with the exception of a berm that will be constructed to the west of the landfill area. Surface water runoff from Catchment 302 will continue to drain south along the western ditch along Brooks Road to the Site outlet, as in existing conditions. Catchment 303 will be a small area at the southwest corner of the Site formed by a proposed berm and the Site boundary. Surface water runoff from this catchment will drain to the Site discharge point in the western ditch.

3.5 PROPOSED VERTICAL EXPANSION STORMWATER MANAGEMENT SYSTEM

The proposed vertical expansion post-closure Site plan is presented on Figure 4. The proposed vertical expansion condition stormwater conveyance system is very similar to the currently approved system with the exception that the overall landfill height has

increased. Increasing the vertical height of the landfill changes the overall catchment slope.

The drainage boundaries for the proposed vertical expansion condition are presented on Figure 5. Figure 6 presents the flow schematic of the proposed conditions and illustrates how each catchment is routed to Outfall 1 and Outfall 2.

3.6 PROPOSED STORMWATER MANAGEMENT MEASURES

Post-closure stormwater management controls are proposed for each condition to mitigate the effects of increased peak flows due to the landfill development. For the currently approved and proposed vertical expansion conditions these controls will include internal drainage ditches and a stormwater management pond.

A 1-metre deep drainage ditch will be constructed around the perimeter of the landfill area and will convey runoff from the landfill cap and access road to the stormwater management pond. The MOE Guidelines require that all internal drainage ditches have sufficient capacity to convey the peak flows generated from a 25-year design storm, with a continuous overland flow route to convey flows from the 100-year and Regional storm events. The proposed ditches will have capacity to convey flow in excess of that generated by the 100-year or Regional storm. The ditches are proposed to have 4:1 (horizontal:vertical) side slopes on the landfill side, and 3:1 side slopes on the perimeter access road side of the ditches.

The stormwater management pond is proposed in Catchment 210. A wet pond is proposed with a maximum permanent pool depth of 0.6 m. The pond is proposed with 4:1 side slopes, and a berm in the midsection of the pond that will create an extended flow path, which will allow for additional settling of suspended solids. A forebay at the pond inlet is proposed to enhance water quality and capture coarse grained sediments. The pond will receive the discharge from the landfill cap perimeter ditches through two 600 mm diameter concrete culverts and an open swale.

The pond outlet is proposed to consist of a perforated pipe with a 75 mm orifice plate at the permanent pool elevation, an overflow catchbasin located in the pond side slope with an inlet located at the 5-year ponding elevation, and an emergency overflow berm. Surface water runoff volumes up to the 5-year storm event will be discharged via the riser pipe outlet. The outlet structure design will provide 24 hours of extended detention for the 25 mm storm event runoff volume. The control structure will outlet via two 375 mm diameter concrete pipes at an invert of 197.77 m. The riser pipe outlet will be outfitted with a sluice gate to temporarily prevent discharge from the pond up to a

5-year storm event should concerns with stormwater quality arise. The gate will normally remain in the open position. In the event of a spill or if there is a potential to release impacted water (i.e., an oily sheen is visible in the pond), the gate shall be closed and the impacted waters shall be contained. The waters shall be tested and disposed of in accordance with the appropriate means and methods.

The proposed stormwater management pond will have a permanent pool volume of 1,266 m^3 and a total live storage volume in excess of 5,502 m^3. For the proposed vertical expansion conditions the pond will meet requirements for discharge with total off-Site discharge for the Regional storm event calculated to be 0.82 m^3/s. As outlined by the MOE Guidelines, the stormwater management pond will have sufficient capacity to detain the runoff from all storm events up to and including the Regional storm event. This volume is in excess of the MOE Draft Stormwater Management Planning and Design Manual (November, 1999) requirements for Level I (Enhanced) protection.

The proposed stormwater management construction details are presented on Drawings 12 and 13.

4.0 HYDROLOGIC ANALYSIS

The following hydrologic analysis was completed to calculate peak flows and runoff volumes from the Site under various storm event conditions. The computer model PCSWMM 2012 Version 5.0.022 was used to complete the analysis. Distinct design storm hyetographs were created in PCSWMM, based on the Environment Canada's Rainfall Intensity Duration Frequency (IDF) Values for the Hamilton Airport. The 2-, 5-, 10-, 25-, 50-, and 100-year 24-hour, SCS Type-2 distribution, storm events were considered in the hydrologic modelling to provide a design basis for on-Site SWM features (quantity control). The IDF Values for the each of these storm events are summarized in Table 1.

CRA also assessed the performance of the water quality management features using the 25-mm, 4-hour duration storm, consistent with MOE's "Storm Water Management Practices – Planning and Design Manual" (2003).

CRA has developed two model scenarios identified as follows:

1. The Currently Approved Post-Closure condition.
2. The Proposed Vertical Expansion condition

These modelling scenarios were compared to the results obtained from the original SWM Report for the Existing Condition and the Interim Condition (as presented within Appendix B).

4.1 MODELLING RESULTS

The stormwater management pond and drainage ditches were designed based on accepted methodologies, calculations, and analytical tools using the hydrologic model PCSWMM. Hydrologic modelling output for the currently approved condition is provided in Appendix C, and for the proposed vertical expansion is provided in Appendix D. Supporting engineering calculations are provided in Appendix E.

The hydrologic model was used to calculate the surface water runoff volumes for the Site under the various conditions.

Table 2 summarizes the model input parameters for the currently approved post-closure condition. Table 3 summarizes the model input parameters for the proposed vertical expansion condition.

Table 4 presents the calculated runoff peak flow rates for proposed vertical expansion conditions and compares them to the existing condition. The peak flows represent the overland runoff peak flows for the various catchments, with the off-site discharge peak flows presented as the Outlet peak flow values. The runoff peak flows for all storm events less than the 100-Year event decrease from existing to post-closure conditions, meeting the requirements set out in the MOE Guidelines. The Regional Storm Event generates a slightly higher peak flow as a result of the proposed development. The 75 mm-diameter orifice outlet provides in excess of 24 hours of extended detention of the 25 mm storm event runoff volume.

Table 5 summarizes the runoff volumes calculated for each catchment under the currently approved and proposed vertical expansion conditions and compares them to the existing condition. Because some surface water remains within certain catchments, the total Site runoff volume does not represent the total volume of surface water runoff actually discharged off site.

Table 6 summarizes pond performance showing peak inflows and outflows, maximum ponding elevations, and maximum storage volumes for the currently approved and proposed vertical expansion condition.

5.0 EROSION AND SEDIMENT CONTROL PLAN

The stormwater management pond was designed to promote settling of suspended particulate and to minimize re-suspension of the solid matter. The settling action will reduce suspended soil particles and other pollutants, which may be in particulate form and/or adhered to the soil particles.

The perimeter ditching network and stormwater management pond will be maintained by removal of collected sediment on an "as-required" basis to ensure that the ditching and pond continue to operate as designed. Accumulated sediment will be removed when the storage capacity of a channel or the pond is reduced by one third. All sediment removed during the operating life of the landfill will be returned to the active disposal area. Subsequent to landfill closure, all dredged sediments will be returned to the landfill and placed as final cover soil. Zones where sediments are placed as part of final cover activities shall be bounded by silt fence until such time as the vegetation has reached 70 percent of the native background density. Sediment transport from the landfill area will decrease as the vegetative cover over completed areas of the landfill is established.

Additional measures will also be employed to minimize sediment transport at the source and prevent runoff that has contacted landfilled waste, which may contain particulate and/or soluble pollutants, from migrating from the landfill area. These measures are as follows:

- temporary soil berms will be utilized throughout the active landfill disposal area to prevent runoff from leaving waste areas and to direct upgradient runoff around the active disposal area
- all water that has contacted landfilled waste will be treated as leachate and will be drained by a leachate system, pumped and transported off-Site for disposal
- rock and straw bale check dams and/or silt fences will be utilized in drainage swales and on slopes to enhance erosion and sedimentation control during and immediately after construction phases in locations where necessary

6.0 MONITORING PLANS

The Site is currently staffed full-time by landfill staff to oversee Site operations. Regular visual inspections shall be made on a monthly basis during active construction activities to assess the effectiveness of the erosion and sediment control measures implemented, and to conduct any required maintenance activities. After the period of active construction activities has been completed (final installation of the landfill cap), regular visual inspections shall be made on a bi-monthly basis until adequate Site stabilization is achieved.

Erosion and sediment controls shall be maintained until all disturbed areas of the Site, including the pond and swales, have fully stabilized and vegetated areas have achieved 70 percent of the native background density of growth.

The condition of all swales, culverts, vegetation, infiltration basin outlet, and outflow channels leading to the Brooks Road drainage ditch and off Site will be noted at regular intervals. Should any defects be identified, appropriate corrective actions will be scheduled and tracked. Regular maintenance of SWM Plan features and unscheduled corrective actions will be conducted during appropriate seasons and concurrent with other Site operations.

7.0 CONCLUSION

The proposed stormwater management measures meet the requirements set out by the MOE Guidelines.

The proposed stormwater management measures as described in this Stormwater Management Plan are based on the modeling and design calculations described in this report. These proposed measures consist of drainage ditches and a stormwater management pond. The internal drainage ditches and stormwater management pond are adequately sized to accommodate the peak flows and runoff volumes for the 25-year and Regional storm events respectively. The total off-site peak discharge rates for post-closure conditions will be less than existing conditions for all storm events.

Should you have any questions on the above, please do not hesitate to contact us.

All of Which is Respectfully Submitted,
CONESTOGA-ROVERS & ASSOCIATES

Gregory D. Ferraro, P. Eng.

Paul Farquarson, C.E.T.

APPENDIX A

PRE-APPLICATION CONSULTATION RECORDS

CONESTOGA-ROVERS & ASSOCIATES

MEETING MINUTES

Reference No. 018235

PROJECT: Site Decommissioning and Stage 2A Construction

OWNER: Brooks Road Environmental c/o 2270386 Ontario Limited CONTRACT NO.: 018235 (33)

RE: Progress Meeting No. 6

LOCATION: Brooks Road Landfill Site DATE: November 01, 2012 TIME: 1:00 pm

Participants:

Reid Robertson (BRE)	Allison Butcher (MOE)	Paul Zizek (Tervita)	Jordan Wilson (Tervita)
Dan Roberts (Tervita)	Peter Kemp (CRA)	Dan Turner (CRA)	

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	Richard Weldon (BRE)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the October 16, 2012 Progress Meeting No. 5 were reviewed. The following items were noted: • Drainage stone submittal has been submitted by Tervita and approved by CRA • Geotextile roll certificates have been submitted by Tervita and under review by CRA • Tervita to submit finalized Off-Site Transportation and Disposal Plan	 CRA Tervita
2.	**Work progress and Construction Progress Schedule** An updated construction schedule is provided as an attachment to the minutes. Key changes include: • HDPE liner installation anticipated to begin November 12, 2012 and complete November 21, 2012 • Current schedule anticipates cell completion on December 11, 2012	
3.	**Field Observations, Problems, and Decisions** Weather over the past week has caused significant delays due to high volumes of precipitation. Wet weather conditions have pushed the construction schedule back approximately 1 week. Accumulated water in the Stage 2A cell is being pumped to the TDS pond. The pond will be sampled this Friday and Reid will have a quicker turnaround time applied to the sample results in order to discharge water to the roadside ditch sooner.	

Item	*Description*	*Action By*
3.	**<u>Field Observations, Problems, and Decisions</u> (cont'd)** Zizek – Will look into bringing in a second packer to work on the south slope for the compacted clay liner (CCL). Using this approach would not reduce the working days necessary for cell completion, but would act as a contingency to ensure that there are no delays associated with subsequent HDPE liner installation. Approximately 2 to 3 days are required to decommission the estimated 1,500 cubic metres of waste in the Phase 1 Decommissioning Area that is above the remaining clay to be excavated for Stage 2A cell construction. This quantity is in addition to the estimated 10,000 cubic metres of waste in the Phase 1 area that is outside of the clay excavation area. The 1,500 cubic metres of waste will be directly hauled and disposed of in the Stage 1 cell. Kemp – Proposes to temporarily stockpile the remaining 10,000 cubic metres of waste in the Stage 1 cell, as opposed to the Phase 2 Decommissioning Area, with the intention of moving the waste into the Stage 2A cell when completed. Ideally, the waste would be moved into the Stage 2A cell after an appropriate lift of incoming waste were placed on the base of the cell in order to optimize the leachate collection system. The additional benefit would be significant time savings associated with decommissioning the Phase 2 area.	Tervita
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** If wet weather conditions persist, further delays can be expected. No other problems were identified at this time.	
5.	**<u>Submittals Schedule and Status of Submittals</u>** Tervita to submit finalized Off-Site Transportation and Disposal Plan	
6.	**<u>Health and Safety Concerns</u>** No health and safety concerns were identified at this time. Open excavation areas have been promptly taped off and appropriate signage has been set up.	
7.	**<u>Maintenance of Progress Schedule</u>** The construction schedule has been updated to reflect delays associated with unfavourable weather conditions. Zizek – A proposed shutdown has been built into the construction schedule at Christmas time. Actual days for shutdown will be contingent on work progress to date.	
8.	**<u>Effect of Proposed Changes on Progress Schedule and Coordination</u>** There are no proposed changes at this time.	

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
9.	**Contract Administration** Payment Certificate 3 has been executed. Tervita will provide Payment Certificate 4 for CRA review on Friday November 9, 2012.	
10.	**Other Business Relating to the Work** Butcher – Noted that groundwater sampling is to be completed this month at the Site. Asked whether any decision has been made regarding the damaged wells on the northern perimeter of the site. Also noted that there may be a damaged well at the southeastern portion of the Site. Kemp – The location of the damaged wells and the subsurface soil conditions in which they are installed needs to be assessed to determine whether the wells can be moved. The concern with reinstalling the wells in the same locations is that there is a risk of reoccurring damage. Butcher – A proposal may be submitted to the MOE detailing the reinstallation of the groundwater monitoring wells. Butcher – Noted some exposed waste at the north end of the Stage 1 cell due to heavy rainfall. Robertson – Has discussed the exposed waste with Tervita and cover material will be placed over the exposed area. Kemp – Due to weather conditions, the site survey required for the Interim Stormwater Management Plan has been delayed. Is it possible to adjust the submission time of the Interim Stormwater Management Plan? Butcher – May be able to adjust the submission time to accommodate the delay. Peter Kemp to send an email detailing the proposed delay.	CRA CRA

Prepared By: Dan Turner and Peter Kemp Date Issued: November 9, 2012

This confirms and records CRA's interpretation of the discussions which occurred and our understanding reached during this meeting. Unless notified in writing within 3 days of the date issued, we will assume that the following interpretation or description is complete and accurate.

ID	Task Name	Duration
1	Notice to Proceed	0 days
2	Mobilization and Startup (includes silt fencing/straw bale check dams)	5 days
3	Clearing and grubbing	3 days
4	Set-up of staging and decon for first stage of waste excavation	2 days
5	Completion of east temporary berm	1 day
6	Bulk Clay Excavation (approximately 9,000 m3)	5 days
7	Direct haul of 9000 m3 of waste to Cell 1 (including 500 m3 of possible segregation)	7 days
8	Completion of temporary berm along west and south extents of waste removed	1 day
9	Excavate and stockpile on-site approximately 39,000 m3 of native clay	19 days
10	Construction of Compacted Clay Layer	27 days
11	HDPE liner	8 days
12	Non-woven geotextile	3 days
13	Completion of temporary divider berm as per drawing C-03	2 days
14	Excavate 5000 m3 of waste and stockpile on Phase 2	14 days
15	Excavate and stockpile on-site approximately 43,000 m3 of native clay	25 days
16	Drainage layer material/Leachate pipe installation	8 days
17	Woven geotextile	3 days
18	Video inspection of leachate collection system pipe	2 days
19	Excavate remaining 10000 m3 of waste and stockpile on Phase 2	7 days
20	Christmas Break	7 days
21	Backfill and grading of decommissioning areas	5 days
22	Hydroseeding	5 days
23	Demobilization and closeout	4 days

MEETING MINUTES

Reference No. 018235

PROJECT: Site Decommissioning and Stage 2A Construction

OWNER: Brooks Road Environmental c/o 2270386 Ontario Limited CONTRACT NO.: 018235 (33)

RE: Progress Meeting No. 9

LOCATION: Brooks Road Landfill Site DATE: December 11, 2012 TIME: 9:30 am

Participants:

Richard Weldon (BRE)	Reid Robertson (BRE)	Paul Zizek (Tervita)	Dan Roberts (Tervita)
Allison Butcher (MOE)	Peter Kemp (CRA)	Dan Turner (CRA)	

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	John Beals (MOE)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the November 27, 2012 Progress Meeting No. 8 were reviewed. The following items were noted:	
	• Tervita to submit finalized Off-Site Transportation and Disposal Plan.	Tervita
	• CRA has received comments from the MOE regarding the Interim Stormwater Management Plan (ISWMP). CRA to address comments and resubmit to the MOE.	CRA
	• Tervita confirmed receipt of payment for Payment Certificate 4.	
	• MOE has provided a letter detailing an allowance for temporary stockpiling of historical waste on the Stage 1 cell.	
	• CRA and Tervita will discuss the required change order for removal of Phase II Decommissioning Area waste.	CRA/Tervita
	• CRA and Tervita have discussed the temporary separation berm design between Stage 2A and 2B. The berm will not be modified from the original design.	
	• The leachate collection pipes have been installed in Stage 2A. The northern pipe was installed at a modified slope due to the Stage 1 pipe being constructed at a higher elevation than designed.	
	• Tervita has submitted QA/QC information for HDPE liner installation from Terrafix to CRA with the exception of the required subgrade acceptance forms. Tervita to submit the remaining information from Terrafix.	Tervita
	• Tervita has submitted some gradation samples for the drainage stone and will continue to submit samples as they are received.	Tervita

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
1.	**<u>Review of Previous Meeting Minutes</u> (cont'd)**	
	• Payment Certificate 5 has been submitted to CRA and a recommendation for payment will be issued pending receipt of statutory declaration from Tervita.	Tervita
	• Tervita to submit costs for cleaning leachate collection system piping for CRA to develop a change order. Cleaning of leachate collection pipes to be done in conjunction with the video inspection of the leachate collection pipes.	Tervita
	• Six soil gas probes have been installed at the site. MOE requested a drawing showing the locations of the installed probes, as well as a letter detailing the reasoning for installing six probes instead of the eight stipulated in the approved Design and Operations Report (CRA, 2003). MOE also noted that the letter can contain a request for revised landfill gas monitoring frequency as was previously discussed by CRA.	CRA
2.	**<u>Work progress and Construction Progress Schedule</u>** Zizek – Detailed progress to date and expected completion times • The drainage stone in the base of the cell will be graded today and tomorrow • Leachate pipes have been installed • Drainage stone placement on sideslopes is taking longer than expected. • Cell completion is anticipated for mid next week • It will likely take 1 week to construct a ramp of waste into Stage 2A Weldon – Requested 3 days' notice of cell completion.	Tervita
3.	**<u>Field Observations, Problems, and Decisions</u>** Turner – While attempting to push stone up the northern sideslope, the non-woven geotextile pulled down and the HDPE liner was damaged. The damage has been repaired however Tervita will need a new method for stone placement to prevent further damage. Zizek/Roberts – The anchor trenches will be backfilled to prevent geotextile movement and the stone will be placed halfway up the slope in a 1-metre-thick lift before slowly pushing stone up the remaining portion of the slope. There is potential to bring in another dozer to expedite the process.	
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** No problems were identified at this time.	
5.	**<u>Submittals Schedule and Status of Submittals</u>**	
	• Tervita to submit finalized Off-Site Transportation and Disposal Plan	Tervita
	• Tervita to submit Terrafix subgrade acceptance forms to CRA	Tervita
	• Tervita to submit gradation testing for drainage stone to CRA	Tervita

RE: Construction Progress Meeting No. 12

LOCATION: Brooks Road Landfill Site

DATE: February 14, 2013

TIME: 11:00 AM

Participants:

Richard Weldon (BRE)	Reid Robertson (BRE)	Doug Robinson (BRE)	Paul Zizek (Tervita)
Jordan Wilson (Tervita)	Allison Butcher (MOE)	Peter Kemp (CRA)	Dan Turner (CRA)

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	Joel Rider (Tervita)
		John Beals (MOE)	Dan Roberts (Tervita)	Brad Farnand (MOE)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the January 30, 2013 Progress Meeting No. 11 were reviewed. The following items were noted:	
	• The MOE district office has received the letter application to revise the landfill gas monitoring frequency. Allison Butcher to check on status of request with Approvals Branch.	MOE
	• Tervita completed repairs upon returning to work after unfavourable weather conditions including: placing cover over exposed Phase II waste, reconstructing divider berm in the vicinity of the disposal trench, and completing the final panel of woven geotextile on the north sideslope.	
	• Tervita has provided an updated construction schedule	
	• CRA has developed a Change Order for Stage 1 grading of waste to final contours and interim cover application. Brooks Road to review and approve the Change Order.	BRE
	• Brooks Road to send PLC minutes to CRA and develop action item list for distribution to PLC prior to next meeting.	BRE
	• Brooks Road to develop Terms of Reference for PLC meeting	BRE
	• CRA requested MOE notes from PLC meeting. Butcher to send notes to Kemp	MOE
	• Robinson – Noted that the application for alternative daily cover is broad and may take more time to approve. Requested that Butcher look into the possibility of pre-approving tarps as an alternative daily cover in the interim.	

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
1.	**<u>Review of Previous Meeting Minutes</u> (cont'd)**	
	• Butcher – Will look into possibility of pre-approval	MOE
	• Three Baker tanks have arrived on-Site and Brooks Road intends to store leachate in the tanks until a leachate treatment system is installed on-Site. Brooks Road is looking into an insulation material for the tanks comprised of agricultural material.	
	• Butcher – Would like to talk to agricultural group of MOE about feasibility of using this material as insulation.	
	• Wilson – Could use submersible pumps to keep stored leachate from freezing.	
	• CRA estimated that approximately 1,000,000 litres of leachate is present in the landfill when the leachate level is at 60 cm.	
	• CRA requested information on leachate quantity trucked off-Site in order to estimate the leachate generation rate. BRE to supply trucking invoices.	BRE
2.	**<u>Work progress and Construction Progress Schedule</u>** Zizek – Detailed progress to date and expected completion times: • Phase I decommissioning will be completed today • Phase II decommissioning scheduled to begin Monday • Item 18 in the attached schedule (excavation of remaining Stage 2 clay) includes approximately 11,000 m^3. This material will be used to backfill decommissioned areas. • Contract Works, including Stage 1 waste grading/interim capping and ISWMP Works, are scheduled to be complete at the end of June Weldon – Wants interim capping works expedited to minimize leachate generation.	
3.	**<u>Field Observations, Problems, and Decisions</u>** Zizek – Weather conditions have prevented Tervita from working 7 out of 20 days in January. Turner – A small amount of exposed waste noted in Phase II has been covered. Area E and C wastes from drum staging pad have been relocated to the Stage 1 cell based on sample results characterizing the waste as non-hazardous. At the request of the MOE, the area where the waste was disposed of was measured out and logged in CRA field notes. Robinson – Requested Tervita leave a clay berm at the northern access point to Stage 1 to prevent runoff.	
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** No problems were identified at this time	

Item	*Description*	*Action By*
5.	**Submittals Schedule and Status of Submittals**	
	• Tervita to submit finalized Off-Site Transportation Plan (carry over)	Tervita
	• Tervita to submit remaining gradation test results for drainage stone	Tervita
	• Tervita to submit costs for cleaning leachate pipes for CRA to develop a change order.	Tervita
6.	**Health and Safety Concerns** No health and safety concerns were identified at this time.	
7.	**Maintenance of Progress Schedule** No maintenance is required on the progress schedule at this time	
8.	**Effect of Proposed Changes on Progress Schedule and Coordination** There are no proposed changes at this time	
9.	**Contract Administration**	
	• CRA to develop RFQ for ISWMP Works	CRA
	• CRA to review Payment Certificate 7 and provide recommendation for payment	CRA
	• Tervita to submit Payment Certificate 8 for CRA review	Tervita
10.	**Other Business Relating to the Work** Butcher – Inquired about the operational status of the wells on the northern Site boundary and the one well at the eastern boundary. Also inquired if there were plans for reinstallation. Kemp – Genivar would have determined if the eastern well is still useable during the previous sampling round. The wells in the north will be reinstalled prior to the next sampling event (May 2013). Butcher – Brooks Road requires approval if the wells are to move locations. Butcher – Inquired about the status of the fencing repairs. Robertson – Contractors were here to repair fencing and install gate but the weather prevented access to the northwest area of the site. They will be returning soon to complete the repairs. Butcher – The ISWMP Works and Stage 1 waste grading/interim capping was scheduled to start in February. Is this still the case? Kemp – Weather delays have pushed the schedule back for the ISWMP and Stage 1 Works. The Works are still scheduled to be completed following waste decommissioning.

LOCATION: Brooks Road Landfill Site DATE: March 21, 2013 TIME: 11:00 AM

Participants:

Mark Collins (BRE)	Brad Farnand (MOE)	Paul Zizek (Tervita)	Joel Rider (Tervita)
Peter Kemp (CRA)	Dan Turner (CRA)		

Distribution:	Attendees	Greg Ferraro (CRA)	Don Campbell (CRA)	John Beals (MOE)
		Richard Weldon (BRE)	Dan Roberts (Tervita)	Jordan Wilson (Tervita)

Item	*Description*	*Action By*
1.	**Review of Previous Meeting Minutes** The meeting minutes from the March 5, 2013 Progress Meeting No. 13 were reviewed. The following items were noted: • Brad Farnand spoke with Dickson regarding the letter application for alternative daily cover. Dickson confirmed that he has the application and is aware that the approval of tarps is considered a priority for Brooks Road. Brad suggested that BRE call Dickson for an update. • Tervita has submitted the remaining gradation test results for the drainage stone. • CRA will provide Tervita with the ISWMP request for quotation by end of day. • Paul Zizek confirmed that BRE has paid Payment Certificates 7 and 8. • CRA has revised the Payment Certificate template to incorporate Change Orders 5 and 6. • Tervita has submitted Payment Certificate 9 for CRA review. • CRA is currently reviewing historical monitoring data to update the Site Monitoring Plan. • The northwestern perimeter gate has been repaired and the fence repairs are underway. • MOE requested notice of confirmatory sampling in the vicinity of TP4-2 (where waste was characterized as hazardous for lead). The waste excavation and confirmatory sampling in this area is scheduled for Monday, March 25.	BRE

Item	*Description*	*Action By*
2.	**<u>Work progress and Construction Progress Schedule</u>** Zizek – Detailed progress to date and expected completion times: - The Phase II decommissioning is 90 percent complete. Estimated to be 3 days of waste excavation remaining. - Exposing 1-metre of woven geotextile around the perimeter of the Stage 1 cell will be completed today. - Cut and fill of Stage 1 waste will be completed tomorrow. - The interim capping of Stage 1 will commence Monday and is estimated to be complete in 1 week. The packer will arrive on Monday, March 25. - Backfilling of decommissioned areas will be completed between other tasks. Turner – Noted that a confirmatory soil sample did not pass O. Reg 511/09 Table 2 standards for hot water extractable boron. This area requires further excavation and re-sampling prior to backfilling. Kemp – There is a potential for waste to be present in the right of way in the northwest corner of the Phase II Decommissioning Area. CRA has an excavation/occupation permit form to be completed prior to work in the right of way. CRA will send information to Tervita.	CRA
3.	**<u>Field Observations, Problems, and Decisions</u>** Turner – After commencing the waste excavation in the vicinity of Area A, free product was observed and CRA determined that further waste characterization was required in this area. Tervita and CRA completed test pits in the area to collect samples for waste characterization in place to minimize the handling requirements. Sample results will determine the required end location for the waste streams. All liquid waste in this area will be pumped into tanks for off-Site disposal. Collins – Some exposed waste in the Stage 2A cell in the vicinity of Tervita's work area requires cover by end of day.	
4.	**<u>Problems Having Potential to Impede Planned Progress</u>** No problems were identified at this time	
5.	**<u>Submittals Schedule and Status of Submittals</u>** • Tervita to submit finalized Off-Site Transportation Plan (Tervita currently in discussion with CRA) • Tervita to submit costs for cleaning leachate pipes for CRA to develop a change order. Zizek noted that the inspection could be moved to a later date if the Stage 2B cell is going to be lined.	Tervita Tervita

CONESTOGA-ROVERS & ASSOCIATES

Item	*Description*	*Action By*
6.	**Health and Safety Concerns** Turner – Work in Area A requires Level C PPE. A JSA has been prepared by Tervita and reviewed by all parties involved in work in this area.	
7.	**Maintenance of Progress Schedule** No maintenance is required on the progress schedule at this time	
8.	**Effect of Proposed Changes on Progress Schedule and Coordination** The ISWMP work will require an updated schedule. To be completed once Tervita provides a quote.	
9.	**Contract Administration** • CRA to develop an RFQ for ISWMP Works by end of day • CRA to review Payment Certificate 9 • Zizek inquired about starting an RFQ for Stage 2B work to provide more time for pricing	 CRA CRA
10.	**Other Business Relating to the Work** Rider – The silt fencing along the western boundary of the Phase II Decommissioning Area will be moved to the property boundary Farnand – Inquired about the status of the secondary containment around the Baker tanks. Collins – Richard Weldon is considering the decision to keep the Baker tanks and complete the secondary containment or remove the tanks.	
11.	**Next Meeting** April 8, 2013 at 11:00 am.

TECHNICAL MEMORANDUM

TO:	Richard Weldon (Brooks Road Environmental c/o 2270386 Ontario Limited)	REF. NO.:	018235-10
FROM:	Peter Kemp/mg/82rev3 P.K.	DATE:	January 3, 2013
CC:	Greg Ferraro		
RE:	**Updated Interim Stormwater Management Plan Brooks Road Landfill Site Haldimand County, Ontario**		

1.0 INTRODUCTION

An interim stormwater management plan (ISWMP) has been developed for the Brooks Road Landfill (Site) in response to the Ministry of the Environment (MOE) request for an ISWMP to be implemented at the Site until the permanent stormwater management plan (PSWMP) is implemented. The ISWMP has been developed to manage surface water runoff discharging from the Site through use of the approved temporary dewatering sedimentation (TDS) pond. This memo presents the ISWMP as updated to address the MOE comments received on the initial ISWMP submitted on November 28, 2012, the revised ISWMP submitted on December 14, 2012, and the revised ISWMP submitted on December 20, 2012.

Upon completion of the OLA decommissioning work, the PSWMP will be implemented commencing with the stormwater management pond in the southwest corner of the Site. The PSWMP that was approved for the Site until June 9, 2009 is provided in the approved Design and Operations Report (CRA, 2003). An application to renew the approval for the PSWMP will be submitted to the MOE Approvals Branch by March 31, 2013.

2.0 OBJECTIVES

The ISWMP for the Site has been developed in accordance with the design requirements of O. Reg. 232/98. The primary objectives of the ISWMP are to:

- Ensure that no stormwater runoff will enter the Brooks Road ditch from the Site under the worst historic regional storm scenario (Hurricane Hazel)
- Control surface water runoff from the Site into active disposal areas in order to minimize surface water contacting refuse
- Minimize potential or on-Site and sediment loading to the downstream water course

The receiving off-Site drainage courses are described in Section 4.6.2 of the approved Design and Operation Report (CRA, 2003).

3.0 DESIGN CRITERIA

The ISWMP design consists of perimeter ditches, culverts, an upgraded TDS pond, and associated works to meet the requirements of the Amended Certificate of Approval Number 8371-6X9LB, issued on February 20, 2007 (C of A). The design basis is consistent with the PSWMP contained in the approved Design and Operations Report (CRA, 2003). In the Design and Operations Report, the runoff from the final post-closure catchment areas was calculated using the hydrological model MIDUSS 4.72. In the present design the latest PCSWMM Version 5.1.1279 Professional was used to calculate the runoff using the same catchment parameters as in MIDUSS, providing approximately the same unit peak runoff and total volume per area. The catchment parameters used in the model are the contributing drainage area, catchment slope, sheet flow, length, width, Manning's 'n', percent impervious, soil infiltration rates, depression storage and the weighted Curve Number (CN) infiltration method.

The ditches and four culverts were sized to accommodate the peak flow generated from the 3-hour-duration, 25-year storm, as required by the MOE Guidelines. All drainage ditches were sized to have a 0.3-m bottom width with a minimum of a 1-meter depth and 3:1 side slopes (horizontal:vertical). The proposed culverts are designed to have a 450-mm-internal-diameter HDPE pipe with smooth internal walls. Both the ditches and culverts have the capacity to pass the Regional Storm (Hurricane Hazel) without flooding. All culvert inlets, outlets and steeply sloping channels are adequately lined with riprap and turf reinforcement mats in one location to prevent erosion.

The upgraded TDS pond was designed to meet, or exceed the requirements of the above mentioned C of A. The required pond volume was calculated to be 10,235 m^3 in order to contain the total volume of stormwater runoff under the Regional Storm to prevent any flow discharging to the adjacent Brooks Road ditch shown in Drawing C-01. A 300-mm HDPE outlet pipe was selected as an emergency overflow spillway as an added factor of safety. The pond will be lined with riprap at the two inlets to prevent any erosion. The pond internal and external side slopes are designed to have a slope of 2:1 (horizontal: vertical).

4.0 MODELING RESULTS

The upgraded TDS pond, drainage ditches, and culverts were designed based on accepted methodologies, calculations and analytical tools using PCSWMM Professional. The outputs of the model for the 25-year storm and Regional Storm are provided in Attachment 1. Seven design storms were used in the hydrological modeling as shown in Table 1. These events were based on precipitation data as provided by the Atmospheric Environmental Service, Canada. The hydrologic model was used to calculate the surface water runoff volume and peak flows for the Site.

Table 2 summarizes the model input parameters and Tables 3 and 4 present the calculated runoff volumes and peak flow rates, respectively. Table 5 presents the calculated pond performance. Drawings C-01 and C-02 show the upgraded TDS pond, culverts, and ditch layout and design details, respectively.

We trust the design as presented herein is sufficient to satisfy the MOE's request. Should you have any questions on this design or require further information, please do not hesitate to contact us.

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model was developed
July 8 2013 - Culvert on Brooks Road was corrected as single 750mm culvert

****

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model was developed
July 8 2013 - Culvert on Brooks Road was corrected as single 750mm culvert

****
NOTE: The summary statistics displayed in this report are
based on results found at every computational time step,
not just on results from each reporting time step.

Node Flooding Summary
****

Flooding refers to all water that overflows a node, whether it ponds or not.

Node	Hours Flooded	Maximum Rate LPS	Time of Max Occurrence days hr:min	Total Flood Volume 10^6 ltr	Maximum Ponded Depth Meters

J3	0.12	225.36	0	12:23	0.043	1.00

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model was developed
July 8 2013 - Culvert on Brooks Road was corrected as single 750mm culvert

APPENDIX D

PROPOSED VERTICAL EXPANSION CONDITION HYDROLOGIC MODEL INPUT AND OUTPUT

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model developed
July 8 2013 - Culvert crossing on Brooks Road corrected as a single 750mm culvert

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model developed
July 8 2013 - Culvert crossing on Brooks Road corrected as a single 750mm culvert

****
NOTE: The summary statistics displayed in this report are
based on results found at every computational time step,
not just on results from each reporting time step.

EPA STORM WATER MANAGEMENT MODEL - VERSION 5.0 (Build 5.0.022)

April 2013 - Original Model developed
July 8 2013 - Culvert crossing on Brooks Road corrected as a single 750mm culvert

****

APPENDIX E

SUPPORTING DESIGN CALCULATIONS

APPENDIX E1

FOREBAY DESIGN
BROOKS ROAD LANDFILL SITE
HALDIMAND COUNTY, ONTARIO

Brooks Road Landfill Proposed SWM Pond

Design forebay For The Outlet From Outlet

Forebay Length (L)

$$L = \sqrt{\frac{r\ Q}{Vs}}$$

L = 29 m

Length to width ratio (r) =	1	:1
25mm Storm Peak flowrate (Q) =	0.258	m^3/s
Particle size settling velocity (V_s) =	0.0003	m/s

Dispersion Length (D)

$$D = \frac{8\ Q}{d\ V\ f}$$

D = 11 m

Permanent Pool Depth (d) =	0.65	m
Desired Velocity in the Forebay (V_f) =	0.5	m/s
10 year Storm Peak flow rate (Q) =	0.429	m^3/s

Minimum Forebay Bottom Width (W)

$$W = \frac{L}{8}$$

W = 4 m

Velocity Within Forebay (V)

$$V = \frac{Q}{A}$$

V = 0.056 m/s

Actual Upstream Width	4	m
Actual Downstream Width	15	m
Permanent Pool Depth =	0.65	m
Channel Side Slopes =	4	:1
Cross Sectional Area (A) =	8	m^2

Notes: 1. Design Equations are from the "*Stormwater Management Planning and Design Manual*" (MOE, 2003)

1. Introduction

1.1 General

GHD, has prepared the following 2021 Operations and Monitoring Report (2021 O&M Report), on behalf of Brooks Road Environmental c/o 2270386 Ontario Limited (BRE), the owner of the Brooks Road Landfill Site (Landfill/Site). The Site and Site operations are authorized under ECA (Landfill) A110302, ECA (Industrial Sewage Works) 1122-BKUPSM, and ECA (Air) 8922-9ZHR29. In 2021, the Landfill ECA was amended on October 2, 2021 with an approved fill rate of 1,000 tonnes per day (250,000 tonnes per year) and the approved capacity is 1,045,065 cubic metre (m^3) (including waste and daily cover).

As required by the Landfill ECA, this report provides an annual summary of the development, operations, and monitoring of the Site, based upon Section 7.7 of the Design and Operations Report (D&O), dated June 2021, and referenced under Condition 12(6) and 12(7) of the Landfill ECA.

This report provides a summary of the environmental monitoring program results and Site operations conducted in 2021 in accordance with the ECAs in effect during the reporting period. This report also provides an annual performance report as required under Condition 12(4) of the Industrial Sewage Works ECA.

1.2 Site Location

The Site is located at 160 Brooks Road in Haldimand, Ontario, approximately 1 kilometre (km) north of Kings Highway No. 3 (Talbot Road). The Site is legally described as Part of Lot 24, Concession I-N.T.R., Haldimand County.

The total Site area is approximately 14.3 hectares (ha) (35.3 acres) of which 6 ha (15 acres) is approved for landfilling. The regional Site location is presented on Figure 1.1. The local Site setting is presented on Figure 1.2. Copies of the legal surveys for the Site are provided in Appendix A.

The Site is bounded to the north by a rural property consisting of undeveloped fields (i.e., long-term inactive agricultural crop production lands) and forested areas. To the south and east of the Site is undeveloped rural property consisting of a combination of fields and forested areas. The Site is bounded to the west by Brooks Road. On the west side of Brooks Road is an undeveloped rural property which is characterized primarily by undeveloped fields with occasional bush lots.

1.3 Regulatory Approvals

The following lists the ECAs, including the ECA amendments issued for the Site.

– Landfill ECA A110302 was issued on October 7, 1980 and was most recently amended on October 1, 2021.
– Industrial Sewage Works ECA 1122-BKUPSM was issued on February 3, 2020
– Air ECA 7323-C6EJUM was issued on September 24, 2021

Copies of the ECAs, and associated amendments, are included in Appendix B.

An Environmental Assessment (EA) for a 400,000 m^3 vertical expansion was submitted on February 10, 2017. The EA was subject to a seven-week public and agency comment period, followed by a Ministry review and a public inspection of the Ministry Review, which concluded in August 2017. The Notice of Approval to Proceed with the Undertaking - EA Reference Number 13004 and EA File Number 03-08-02 (Notice of Approval) was signed by the Minister of the Environment, Conservation and Parks on January 15, 2019, was approved by cabinet on February 14, 2019, and received by BRE on March 13, 2019.

In April 2019, an ECA amendment application was submitted to the MECP for Landfill ECA A110302 to implement the vertical expansion. On March 27, 2020 the Landfill ECA was amended, resulting in Landfill ECA A110302. The environmental monitoring program for landfill gas (LFG), groundwater, surface water, and leachate were also updated in the amended Landfill ECA.

In September 2019, an ECA amendment application was submitted to the MECP to amend the Industrial Sewage Works ECA to increase the on-Site treatment rate, increase the treated effluent discharge rate and to operate the treatment system on a continual discharge basis. On February 3, 2020, the Industrial Sewage Works ECA was amended, resulting in Industrial Sewage ECA 1122-BKUPSM.

In June 2021, an ECA amendment application was submitted to the MECP to amend the Waste ECA to increase the annual waste fill rate to 250,000 tonnes per year. On October 1, 2021, the Waste ECA was amended. The Air ECA was also amended based on this submission, resulting in the new Air ECA 7323-C6EJUM.

Future Site development, operation and environmental monitoring activities will be carried out in accordance with the amended Landfill ECA and amended Industrial Sewage ECA.

1.4 Purpose and Organization of Report

The 2021 O&M Report has been prepared to satisfy the requirements of Condition 12(6) and 12(7) of the Landfill ECA and Condition 12(4) of the Industrial Sewage Works ECA. The purpose of the 2021 O&M Report is to present, interpret, and evaluate the development, operation, and monitoring of the Site during the 2021 reporting period. This report covers the monitoring period from January 1, 2021 to December 31, 2021.

The O&M Report is organized into the following sections:

– Section 1 Introduction
– Section 2 Background
– Section 3 Site Setting
– Section 4 Environmental Monitoring Program
– Section 5 2021 Monitoring Program Results
– Section 6 Groundwater and Surface Water Compliance Assessment
– Section 7 Site Operations and Development
– Section 8 Financial Assurance
– Section 9 ECA Compliance Status
– Section 10 Annual Monitoring Report Completion Checklist
– Section 11 Conclusions
– Section 12 Recommendations
– Section 13 References

2. Background

2.1 Site History

Based on the information provided in the original 1971 application, the Site was approved under a Provisional Certificate of Approval (now called ECA) as a 15-acre (6.07 ha) landfill site with a daily fill rate of 10 tons (9.07 tonnes). The approved waste composition was 95 percent domestic (solid); 2 percent industrial (solid); 2.75 percent agricultural (solid); and 0.25 percent sewage sludge from the Caledonia Sewage Treatment Plant. The service area for the Site included the Province of Ontario.

Waste from various municipalities in the vicinity of the Site continued to be disposed at the Site on an ongoing basis from 1959 until 1977. After 1977, waste disposal activities were carried out on an intermittent basis. During the above period, waste disposed at the Site was placed in unlined trenches excavated into the native silty soils within the Site. After filling the trenches, waste was disposed directly on the ground surface and covered with a layer of the native soil. The waste stream included metal drums containing resin which have also been disposed at the Site. The area where historic waste was disposed at the Site is referred to as the original landfill area (OLA).

Redevelopment of the landfill commenced with the construction of the Stage 1 engineered landfill cell and decommissioning and cleanup of the OLA. Decommissioning of the OLA commenced on September 4, 2012 and was completed on August 21, 2013 and satisfied Condition 30 of the Landfill ECA No. A110302 Notice 2. A total of 60,204 m^3 of non-hazardous solid waste and impacted soil was excavated from the OLA and transported to the newly constructed Stage 1 landfill cell for disposal. A total of 146.2 metric tons of non-hazardous solid waste, and 47.17 metric tons of suspect hazardous solid waste was excavated and transported off Site for disposal. A total of five over-packed drums of solid non-hazardous waste were transported off Site for disposal. A total of 27,680 litres of liquid hazardous waste was pumped from the OLA and transported off Site for disposal.

The redevelopment of the Site included the construction of new lined landfill cells as follows:

– Stage 1 was completed in 2007
– Stage 2A was completed in 2013
– Stage 2B/3A was completed in 2013
– Stage 3B was completed in 2015

A storm water management system and on-Site leachate treatment system (LTS) have been established on Site. Clean storm water and treated effluent discharge to the Brooks Road roadside ditch and are regulated by ECA No. 1122-BKUPSM.

3. Site Setting

The geographic, geologic, and hydrogeologic framework for the Site and surrounding area have been previously described in a report entitled “Hydrogeologic Performance Assessment” dated October 2002, prepared by GHD. The previously reported information regarding the Site setting is summarized in the following sections.

3.1 Site Topography and Drainage

The Site is located within the Haldimand Clay Plain, which is characterized by level topography and relatively poor drainage. The stormwater management facility currently consists of the surface water management system (SWMS) Pond. The function of the stormwater management system is to capture stormwater runoff from capped portions of the landfill and direct the stormwater to the SWMS Pond by way of perimeter ditching. Stormwater that has contact with waste (i.e., non-capped areas of the landfill) is directed to the leachate collection system within the landfill cell. The SWMS Pond operates as a continuously open pond with an outlet control structure. The SWMS Pond is presented on Figure 2.1, 2022 Existing Conditions.

The roadside ditch along the east side of Brooks Road adjacent to the Site drains south through a culvert under the abandoned railway corridor and empties into a small, natural stream channel which is part of the head waters of Norton Creek. Other drainage from adjacent lands to the west of Brooks Road also flows in culverts under Brooks Road to provide surface runoff to Norton Creek. Other surface runoff contributions include ephemeral streams on lands south of the Site that enter Norton Creek via culverts under the abandoned railway corridor.

3.2 Site Geology

The overburden geology is relatively uniform beneath the Site. In general, the Site is characterized by a thick (14 to 18 m) glaciolacustrine layer of stratified silty clay, silty clay till and varved clays, underlain by a thin (1 to 3 m) discontinuous layer of silty sand till with varying concentrations of gravel and clay. The bedrock is encountered at depths varying from 15.2 to 20.2 m BGS. A thin surficial deposit of topsoil is generally observed at the surface of the Site, except for the southwestern portion, where refuse associated with historical waste disposal activities was observed.

The silty clay deposits are described as being locally fractured (weathered) from the surface down to depths varying from 3 to 5 m BGS, and are characterized as a very stiff to hard unit with low plasticity. At depths more than 5 m, the silty clay deposits have little to no fracturing and the consistency of the units decrease from stiff to very stiff.

Underlying the silty clay deposits, a thin discontinuous silty sand till with varying concentration of clay and gravel is encountered across the Site. The silty sand till ranges in thickness from 1 to 3 m and often contains cobbles and/or broken angular bedrock fragments. This deposit is usually well graded with fine to medium grained sand, minor silt and trace clay, and is described as dense to compact, grey, and saturated. The silty sand till is referred to as a basal till and exists directly over the bedrock.

Bedrock underlying the Site has been described as a fractured shale, dolostone and gypsum of the Salina Formation. The top of bedrock elevation ranges from 180.80 to 185.73 m above mean sea level (AMSL) and forms a small bedrock valley from northwest to southeast across the Site. The small depression is characterized by the thicker silty sand basal till deposit. Regionally, the bedrock topography dips to the south.

3.3 Site Hydrogeology

In general, the geologic units identified at the Site may be grouped into two main flow zones, as follows:

i) An unconfined water table (shallow overburden) unit within shallow fractured silty clay (weathered) unit

ii) A confined basal overburden/shallow bedrock aquifer

These two flow zones are separated by a thick (between 9 and 12 m) layer of stratified silty clay, silty clay till, and varved clays which form an aquitard of very low hydraulic conductivity. Groundwater level data historically gathered from the shallow overburden unit and basal overburden/shallow bedrock aquifer indicate that the presence of the clay aquitard results in hydraulic separation of the two units. A hydraulic head difference varying from 9.5 to 15 m has been historically measured at the location of nested wells.

Based on the groundwater data historically obtained, the unconfined water table unit is generally encountered at depths varying from 0.5 to 4.0 m BGS across the Site. The groundwater flow within the unconfined water table unit is essentially a perched water table resting on the impermeable un-weathered clay units. Based on the shallow overburden monitoring wells monitored in 2021, the groundwater flow in this unit is generally towards the south.

Underlying the silty clay aquitard, a confined basal overburden/shallow bedrock aquifer was observed within the lower portion of the silty sand till unit and the upper fractured bedrock. Groundwater quality and water level data historically gathered from monitoring wells screened within the lower silty sand till unit exhibited similar hydrochemical characteristics which are not substantially different from samples obtained from well nests screened solely within the bedrock. Therefore, these two geological units have been generally considered to form one aquifer.

Based on the groundwater data obtained to date, the basal overburden/shallow bedrock aquifer is generally encountered at depths varying from 14 to 17 m BGS. The groundwater flow pattern of this aquifer is generally characterized by a weak horizontal gradient and a southerly flow direction.

4. Environmental Monitoring Program

4.1 General

The environmental monitoring program developed for the Site is comprised of leachate, groundwater, surface water, and LFG monitoring, in accordance with the Landfill ECA. The surface water management system (SWMS) and leachate treatment system (LTS) monitoring are undertaken in accordance with the Industrial Sewage Works ECA. The various components of the Site monitoring program are summarized in the following sections. The analytical portion of the monitoring program for the current monitoring period was completed by ALS Canada Ltd. (ALS) of Waterloo, Ontario. ALS is registered with the Canadian Association for Environmental Analytical Laboratories (CAEAL).

4.1.1 Leachate Monitoring

The leachate monitoring program includes leachate level monitoring and leachate quality monitoring.

Leachate level monitoring is required to monitor leachate mounding in the landfill and leachate levels in the leachate collection system (LCS). Schedule B of the Landfill ECA requires monthly leachate level monitoring to be completed at leachate well LW1-17 and the inclined leachate collection sump riser pipe located on the southeast side of the landfill. LW1-17 was installed on October 10, 2017. A copy of the stratigraphy and well instrumentation log for LW1-17 is provided in Appendix C. Leachate level monitoring from the inclined leachate collection sump riser pipe is also required for determining compliance with the Leachate Removal Plan (LRP) and Condition 5 of the Landfill ECA.

Leachate quality monitoring as required by the Landfill ECA involved the collection of a leachate sample from the LCS on an annual basis (May). The leachate sample was analyzed for inorganic chemistry parameters, metals, PAH, and VOC parameters. Results from leachate sampling conducted as part of the Landfill ECA are presented in Table 5.3 and discussed in Section 5.2.

Leachate quality monitoring as required by the Industrial Sewage Works ECA involves collection of influent and effluent samples from the LTS. The LTS is operated by Clearford Waterworks Incorporated (CWI). Results from leachate sampling conducted as part of the Industrial Sewage ECA are discussed in Section 5.8.

4.1.2 Groundwater Monitoring

The groundwater monitoring program currently consists of both hydraulic monitoring and water quality monitoring at a network of 34 monitoring wells (26 on-Site and 8 off-Site wells), as listed in Table 4.1a. Groundwater quality parameters analyzed in during the current monitoring period are summarized in Table 5.2, and monitoring well stratigraphic and instrumentation logs, including monitoring well abandonment logs, are provided in Appendix C.

The locations of the on-Site and off-Site monitoring wells forming the current monitoring network are presented on Figure 2.1.

Hydraulic and groundwater quality monitoring are scheduled to take place in May and November, as indicated by the schedule set out in Table 4.1a.

The list of specific parameters analyzed for during the groundwater sampling events is provided in Table 5.2. Results of the groundwater monitoring are presented in Tables 5.4 through 5.6 and discussed in Section 5.4.

4.1.3 Surface Water Monitoring

As specified in the Landfill ECA, the current surface water monitoring program includes water quality monitoring and surface water flow measurements. The surface water monitoring network for the current monitoring period consisted of nine surface water monitoring stations (two on-Site and seven off-Site) as indicated on Figure 4.1. Surface sample collection is ideally only performed when flowing conditions are observed at each monitoring station; however, some

samples have been identified as being collected from stagnant (non-flowing) conditions. Furthermore, an attempt is made to collect surface water samples during precipitation events or shortly thereafter. The approximate locations of the surface water monitoring stations are presented in Figure 4.1. The following provides a brief description of each surface water monitoring station:

– SW1 is located at the culvert on the west-side of Brooks Road approximately 265 m north of the intersection of Brooks Road and the former railway crossing (north of the site).
– SW2 is located on Site and downstream of the outlet from the SWMS Pond.
– SW3 is located downstream of the southwest corner of the Site in the drainage ditch located on the east side of Brooks Road.
– SW4 is located at the upstream end at the double culvert beneath Highway No. 3, approximately 200 m east of the intersection of Brooks Road and Highway No. 3.
– SW5 is located in an existing pond located in the southeastern portion of the Site. This portion of the Site including the pond will be maintained “as is”, i.e., it will be excluded from the Site development activities.
– SW6 is located in an off-Site pond located approximately 30 m south of the Site. During heavy storm events and/or during spring snow melt, this pond may be hydraulically connected to the on-Site pond monitored at SW5.
– SW7 is located in an off-Site pond approximately 24 m south of the Site and approximately 130 m west of SW6 monitoring location. This pond does not appear to receive surface water run-off from the Site.
– SW8 is located in an off-Site pond approximately 230 m south of the Site and approximately 310 m east of Brooks Road. This pond is not hydraulically connected to the Site and, due to its distance from the Site and Brooks Road, water quality in this pond is considered as a background for assessing surface water quality on and around the Site.
– SW9 is located approximately 30 m north of the Site, and north of OW3A/B-13 in a low-lying wetland area.

Water quality monitoring and surface water flow measurements at all surface water stations is scheduled to take place on a quarterly basis in March, May, August, and November. An attempt is made to correlate the surface water monitoring with rainfall events. As such, the John C. Munro Hamilton International Airport in Mount Hope, ON (Hamilton Airport), located approximately 24 kilometres to the north, is often used to schedule surface water monitoring events. A chart of the surface water monitoring dates and daily precipitation, as recorded at the Hamilton Airport and accessed through Environment Canada for the current monitoring period, is presented on Figure 1.3.

The list of specific surface water parameters analyzed for during the current monitoring period is provided in Table 5.7. Results of the surface water monitoring are presented in Tables 5.8 and 5.9 and discussed in Section 5.5.

4.1.4 Landfill Gas Monitoring

LFG generation and subsequent subsurface migration can be the most significant potential risk associated with closed landfills. This risk is mitigated through LFG monitoring. LFG monitoring results provide important information on soil gas quality, subsurface gas movement, and can be used to characterize potential hazards. LFG is produced during the anaerobic digestion of organic matter in municipal solid waste and largely consists of carbon dioxide and methane gas. Methane is explosive within the range of 5 to 15 percent volume by volume (% v/v) at oxygen concentrations as low as approximately 12% v/v (Coward and Jones, 1950[1]). LFG is under positive pressure and has the ability to migrate in the subsurface from a landfill and accumulate in enclosed structures if sufficient barriers to prevent migration are not in place.

The LFG monitoring program includes monitoring gas probes for gas composition (methane, carbon dioxide, oxygen and balance gases), gas pressure, and water levels. The monitoring network currently consists of 12 gas probes installed in five on-Site locations. A brief description of the current LFG monitoring locations is provided below. A copy of the LFG probe construction details is provided in Appendix C.

[1] Coward, H.F. and Jones, G.W., *Limits of Flammability of Gases and Vapours,* 1950.

– GP-1A/B and GP-5 are located in the northwest corner of the Site. These locations are the closest to the nearest off-Site dwelling/structure, which is located approximately 300 m to the northwest of the gas probes.
– GP-2A/B are located between the west limit of waste and Brooks Road
– GP-3A/B and GP-6 are located in the vicinity of the on-Site office/maintenance building
– GP-4A/B and GP-7 are located adjacent to the SWMS pond and the leachate treatment facility effluent holding tanks
– GP-8 is located adjacent to the leachate treatment system

The LFG monitoring activities are to be conducted at the gas probes above on a monthly basis from December 1 through April 30 (i.e., during frozen ground conditions) and on a quarterly basis from May through November. LFG monitoring is a requirement as per Schedule B of ECA No. A110302, as amended.

Monitoring is completed using a uses a Landtec portable gas analyzer to measure the soil gas composition. The current Landtec model used is the Landtec GEM-5000, which has a ±0.3% v/v accuracy for measuring combustible gas (calibrated to a methane standard) for concentrations of 0 to 5% v/v [2]. As such, combustible gas measurements of 0.3% v/v or less are considered not detected in this assessment. Results of the LFG monitoring is presented in Table 5.9 and discussed in Section 5.7.

4.1.5 Industrial Sewage Works Monitoring and Reporting

During 2021, the industrial sewage works operated under the Industrial Sewage Works ECA No. 1122-BKUPSM, issued on February 3, 2020 for the SWMS and leachate collection, treatment, and disposal systems. The LTS was in operation during the current monitoring period. Leachate collected from the LCS was pumped to above-ground storage tanks for treatment in the LTS.

Leachate sampling was conducted in accordance with the Industrial Sewage Works ECA as described in Section 4.1.1.

Surface water samples are collected from the SWMS Pond on a quarterly frequency (spring, summer, fall, and winter) and analyzed for a selected list of inorganic, metals, PAH, and VOC parameters, as indicated in the amended Industrial Sewage Works ECA.

4.1.6 Groundwater and Surface Water Sampling Protocols

The collection of groundwater and surface water samples are to follow standard sample collection protocols, which are designed to ensure that representative water quality samples are obtained. During monitoring events, field data information encompassing water levels, purging information, and field-measured parameters are recorded. A summary of the groundwater and surface water sampling protocols, which are to be followed during Site monitoring activities, is provided in Appendix D, along with the current monitoring program specifications.

4.1.7 Quality Assurance/Quality Control Program

A Quality Assurance/Quality Control (QA/QC) Program involving the collection and analysis of field duplicates and field blanks, as well as the evaluation of standard laboratory quality control samples and procedures, was conducted for all leachate, groundwater, and surface water samples collected by GHD during the current monitoring period. An analytical data assessment and validation report for the current reporting period is provided in Appendix E. All data generated from the current monitoring period are acceptable when used with the qualifications presented in Appendix E.

Groundwater and surface water quality samples collected by GHD personnel followed standard sample collection protocols. All groundwater wells were purged a total of three well volumes and then sampled, unless the well was purged dry, in which case the groundwater sample was collected the same day after allowing the well to recover for

[2] Landtec GEM5000 Operating Manual, Landtec North America Inc.

several hours or occasionally the following morning. All groundwater samples collected for metals parameters were field filtered using a disposable 0.45 micrometre (µm) in-line filter. The sampling protocols were designed to ensure that representative water quality samples were obtained. During the monitoring events, field notes including water level measurements, purging information, and field-measured parameters were collected.

Field QA/QC Program

As part of the field QA/QC program, field duplicate and field blank samples were collected and included for analysis.

Field duplicates were collected at a frequency of one per every ten samples collected. The QA/QC objective of these samples is to evaluate sampling variability and/or the precision of the analytical methods and procedures employed. Duplicate samples were obtained by simultaneously filling two sample containers in order to ensure the homogeneity of the samples. Duplicate samples are submitted as “blind” samples for analyses. In the event that duplicate samples had a high differential between results, a qualification of “J” - estimated concentration is applied to all detections, and “UJ” – estimated detection limit is applied to all non-detections.

One field blank per sampling event was also included as part of the field QA/QC program. The QA/QC objective of the field blank is to determine the existence and magnitude of contamination, if any, occurring in the field during sample handling and/or from ambient air conditions. Field blanks were prepared by filling a sample container with laboratory de-ionized water while in the field. The field blank was also submitted as a blind sample. According to United States Environmental Protection Agency (USEPA) guidelines, when target analytes are detected within the field blank, only analytical results that are greater than five times the level reported in the field blank are considered to be true positive detections. Affected results are qualified as “U” – not detected above sample quantitation limit (SQL). In essence, these guidelines correct for contributory influences not reflected in the limitations of the analytical method, and the SQL is the true confidence threshold. Analytes detected at levels below the SQL are not regarded as being true positive detections, and thus are qualified.

Laboratory QA/QC Program

As part of the laboratory QA/QC program, laboratory duplicates, laboratory blanks, and a laboratory check sample were included for analysis. Laboratory sample holding times were also reviewed.

The allowable holding time of a sample is the maximum time, at sample collection, which can be allowed to elapse before extracting and/or analyzing a sample. By comparing the collection dates of all samples with the reported date of extraction and analysis, the actual holding time is determined and compared to the allowable holding time for each analyte. If samples are not extracted or analyzed within the allowable holding time, a qualification of “J” – estimated concentration is applied to all detections, and “UJ” – estimated detection limit is applied to all non-detections.

Laboratory duplicates consist of laboratory prepared duplicates of field samples. The duplicates are prepared by subdividing a homogeneous field sample into two individual samples for analysis. The QA/QC objective of laboratory duplicates is to check the precision of the laboratory analytical methods employed. Laboratory duplicate qualifications are similar to field duplicate qualifications.

A laboratory blank was prepared by the analytical laboratory on the day of investigative sample analyses and consists of de-ionized water. The QA/QC objective of the laboratory blank is to determine the existence and magnitude of contamination, if any, occurring within the laboratory. Laboratory blank qualifications are similar to field blank qualifications.

Laboratory check samples are prepared by the analytical laboratory by adding a known concentration of a compound to the investigative sample and analyzing the sample for that known compound. The results are compared to established control limits. The QA/QC objective of laboratory check samples is to check the precision of the laboratory analytical methods employed. Laboratory check sample qualifications are similar to holding time qualifications.

5. 2021 Monitoring Program Results

5.1 General

Monitoring of leachate, groundwater, surface water, and LFG was completed during the current monitoring period in accordance with the requirements of the Landfill ECA and Industrial Sewage Works ECA.

The leachate monitoring activities consisted of measuring leachate levels monthly and collecting a leachate sample in May.

The groundwater monitoring activities consisted of measuring water levels and collecting samples from on-Site and off-Site monitoring wells in June and November.

The surface water monitoring consisted of collecting flow measurements and samples from on-Site and off-Site locations in March, June, August, and November.

During the current monitoring period, several water samples were not collected from the following groundwater monitoring wells and surface water monitoring locations for the stated reasons:

Monitoring Location	2021 Monitoring Event	Comment
MW1S-07	November	Blocked
MW4A-09	November	Dry
MW5A-09	November	Not monitored
MW5B-09	November	Not monitored
SW1	June	Dry
SW2	June	Dry
SW3	August and November	Dry
SW4	June	Dry
SW5	June	Dry
SW8	June, August, and November	Dry
SW9	June	Dry

The SWMS Pond was sampled four times in 2021 (March, June, August, and November).

LFG monitoring consisted of collecting gas readings from the LFG probes in January, February, March, April, July, September, and December.

It is noted select sample results for the groundwater, surface water, and leachate sampling for June 2021 sampling event (June 1 through 3, 2021) had to be “qualified” due to the loss of a portion of the field collection records. In the absence of the field documentation, the laboratory results for the June groundwater, surface water, and leachate sampling event were evaluated and assigned to their most likely sampling location (when sample location could not be determined by the sample identification) based on the typical sampling location collection sequence conducted by the Technician, and on a comparison with historical results at each location. The results from these events are noted as being “qualified” on the referenced summary tables by modify with the addition of “**” at the end and of, and underlining, the select sample identification. Additionally, groundwater elevations could not be calculated for the select monitoring wells (MW1A-13, MW1D/S-07, MW5A/B-09, MW6A/B-07, OW3A/B-13, OW8A/B-06, OW8D/S-07, MW10A/B-18. MW11A/B-19, and MW12A/B-19) and were designated with data not available “DNA” where field records were missing.

5.2 Leachate Monitoring

Leachate generated from within the waste cell is conveyed into the LCS and flows by gravity to a sump located in the southeast corner of the landfill base. The leachate is pumped from the sump to an above-ground storage tank for on-Site treatment and/or off-Site disposal.

5.2.1 Leachate Level

Leachate level monitoring at LW1-17 and the transducer installed in the leachate collection system sump was completed by GHD on a monthly basis as summarized below.

Monitoring Date	Leachate Elevation Recorded at LW1-17 (m AMSL)	Leachate Elevation Recorded in the Sump (m AMSL)
January	197.64	196.06
February	197.53	195.19
March	197.53	194.39
April	197.43	194.77
May	197.25	194.35
June	197.35	193.79
July	197.24	196.18
August	197.31	195.55
September	197.25	197.07
October	197.44	197.32
November	198.19	197.39
December	198.22	196.94

The leachate level measurements from the transducer in the leachate collection system sump show reduction in leachate elevation until July 2021 as a result of leachate removal activities. Leachate levels continued to increase from July to December 2021. The leachate elevation measured in leachate well LW1-17 also shows some reduction as a result of leachate removal activities in September 2021, but increased from October to December 2021. The elevation reduction observed in LW1-17 is muted and delayed compared to the elevation reduction observed in the leachate collection sump. This is due to the complicated material properties of the waste mound and the effect of pore pressures which is expected when comparing a monitoring location within the waste mound to a monitoring location within the leachate collection system. The results of leachate monitoring activities indicate that the leachate collection system continues to function as designed.

Leachate levels are further discussed in Section 7.1.7.

5.2.2 Leachate Quality

Leachate quality is monitored to characterize leachate source contaminants and concentrations. Understanding the characteristics of leachate is important for identifying potential leachate impacts to groundwater outside the waste footprint, as well as to surface water. Leachate samples are analyzed for general chemistry, metals, PAH, and VOCs on an annual basis. The 2021 leachate sample results are presented below.

Leachate samples collected from the LCS in accordance with the Landfill ECA were collected on June 3, 2021. Sample results are provided in Table 5.3. The following table summarizes select leachate parameters in comparison to historical concentration ranges and the ODWS where applicable:

Parameters	Units	2021 Results	Historical (2011-2021) Concentration Range	Comparative ODWS
Alkalinity	mg/L	820	820 – 3,700	30 – 500 (OG)
Chloride	mg/L	1,130	555 – 1,440	250 (AO)
DOC	mg/L	188	15.6 – 767	5 (AO)
Hardness	mg/L	1,640	1,560 – 2,310	80 – 100 (OG)
Sulphate	mg/L	287	26 – 1,490	500 (AO)
TDS	mg/L	4,120	2,980 – 5,800	500 (AO)
Aluminum	mg/L	<0.50	0.063 – 1.69	0.1 (OG)
Arsenic	mg/L	0.030	0.030 – 69	0.010 (MAC)
Boron	mg/L	10.0	4.97 – 16.1	5.0 (IMAC)
Chromium	mg/L	<0.050	0.016 – 0.058	0.050 (MAC)
Iron	mg/L	<1.0	<0.10 – 7.51	0.30 (AO)
Lead	mg/L	<0.0050	<0.00050 – 0.0088	0.01 (MAC)
Manganese	mg/L	--	0.249 – 3.04	0.05 (AO)
Sodium	mg/L	716	255 – 843	200 (AO)
Benzene	µg/L	3.40	<0.8 – 4.3	1 (MAC)
Ethylbenzene	µg/L	8.31	<1.00 – 11.5	2.4 (AO) / 140 (MAC)
Toluene	µg/L	1.06	1.06 – 41	60 (AO)
Benzo(a)pyrene	µg/L	<0.010	<0.010 – 0.085	0.01 (MAC)
Naphthalene	µg/L	8.12	2.1 – 11	--
Phenanthrene	µg/L	0.411	0.217 – 4	--
Notes: '--' indicates that no information available				

In general, the landfill leachate is characterized by elevated conductivity, alkalinity, chloride, DOC, hardness, phenolics, phosphorus, TDS, arsenic, boron, and iron. For the purposes of the Site groundwater assessment, alkalinity, boron, chloride, DOC, hardness, sodium and TDS have been selected as appropriate leachate indicator parameters. The concentration patterns of these parameters as they compare to leachate and background groundwater quality will be used as the principal means of identifying the presence and magnitude of leachate impacts within groundwater.

The following VOC parameters were detected in the landfill leachate during 2021: benzene, cis-1,2-dichloroethene, ethylbenzene, xylenes (m&p, o), and toluene. The following PAH parameters were detected in the landfill leachate during 2021: 1-Methylnaphthalene/2-Methylnaphthalene, acenaphthene, anthracene, fluoranthene, fluorene, naphthalene, and phenanthrene. The presence of these parameters in leachate quality may be used in identifying potential leachate impacts to groundwater in conjunction with the leachate indicator parameters identified above.

5.3 Groundwater Elevations

The groundwater elevation monitoring was conducted in accordance with the current monitoring program discussed in Section 4.1.1. A summary of groundwater elevations (2017 – present) is provided in Table 5.1. Hydrographs covering the period 2004 - 2021 are presented in Appendix F.

The results of the hydraulic monitoring program were utilized to interpret the groundwater flow patterns within the shallow overburden, basal overburden/shallow bedrock, and the bedrock hydrogeologic units at the Site. The results of the hydraulic monitoring and groundwater flow assessment are presented below.

5.3.1 Shallow Overburden Unit

Based upon the groundwater elevation data obtained for the current monitoring period, and consistent with historical levels, the shallow overburden unit is generally encountered at depths varying from approximately 0.4 to 5.8 m below ground surface (BGS). During the current monitoring period, the flow direction of the groundwater in the shallow overburden unit was interpreted to flow to the south in November 2021.

Due to the limited data set in June 2021, groundwater elevations contours were not generated. Groundwater elevations for June 2021 were within the historical seasonal range and have historically been interpreted to flow to the south.

The current results are generally consistent with historical results where the shallow overburden unit has been interpreted to flow generally in a southerly direction. Consistent with historical results, the average horizontal gradient was 0.003 m/m during the current monitoring period.

It is noted that the following deviations to the shallow overburden unit groundwater flow contour patterns were observed for November 2021:

– Monitoring wells MW1-03, MW2-03, and MW3-03 are all installed at a similar depth (5.8 m BGS) in close proximity to one another. However, the groundwater elevations between each of these monitoring wells generally vary slightly (up to 0.26 m in June and 0.24 m in November). MW1-03 is more consistent with general shallow overburden flow patterns and as such was selected for generating groundwater contours in November 2021 while MW2-03 and MW3-03 have not been used. There have been no deficiencies observed at either MW2-03 or MW3-03 and so the variation in groundwater elevation at MW2-03 and MW3-03 is likely influenced by local recharge to the shallow water table.
– Groundwater elevations for monitoring wells OW9B-06, MW2B-07, MW10B-18, and MW12-19 were identified at elevations lower than the surrounding wells. MW2B-07 and MW12-19 are typically dry or generally lower than the surrounding monitoring wells. Historical groundwater elevations at MW10B-18 have historically been lower then surrounding monitoring wells but are generally increasing with each monitoring event. The lower groundwater elevation at MW10B-19 is likely contributed to very slow groundwater recharge. OW9B-06 was approximately 1.0 m lower then typically observed and is likely anomalous.

The shallow overburden groundwater elevations and/or flow directions for the current monitoring period are presented in Figures 5.1 and 5.2 with the noted qualifications outlined above.

Hydrographs of shallow overburden groundwater elevations versus time are provided in Appendix F.

5.3.2 Basal Overburden/Shallow Bedrock Unit

Based upon groundwater level data obtained for the current monitoring period, the groundwater level in the basal overburden/shallow bedrock unit is encountered at depths varying from 14.44 to 18.85 m BGS. An average horizontal gradient of 0.0017 m/m was calculated for the on-Site basal overburden/shallow bedrock unit. Due to the flat horizontal gradient, groundwater flow pattern contours were not generated. Historical interpretations have indicated that groundwater generally flows towards the south.

The basal overburden/shallow bedrock groundwater elevations for the current monitoring period are presented on Figures 5.3 and 5.4.

Vertical groundwater hydraulic gradients have been downward during the current and historical monitoring periods as interpreted between the nested shallow overburden and basal overburden/shallow bedrock monitoring wells. The 2021 vertical hydraulic gradient averaged +1.05 m/m, which is consistent with historical gradients.

Hydrographs of basal overburden/shallow bedrock groundwater elevations versus time are provided in Appendix F.

5.3.3 Bedrock Unit

The bedrock monitoring is comprised of intermediate and deep bedrock monitoring wells screened in the same bedrock formation as the basal overburden/shallow bedrock monitoring wells. The intermediate bedrock monitoring wells at the Site are screened between 3.6 to 7.9 m below the top of bedrock, while the deeper bedrock monitoring wells are screened between 9.4 to 14.4 m below the top of bedrock. Discounting OW8D-07, during the current monitoring period, the intermediate and deep bedrock groundwater elevations ranged from 183.98 to 184.13 m AMSL with a very flat horizontal gradient, which is consistent with historical measurements.

The bedrock groundwater elevations for the current monitoring period are presented on Figures 5.5 and 5.6, respectively. Hydrographs of bedrock groundwater elevations versus time are provided in Appendix F.

Detailed information regarding the Bedrock Unit is referenced in the Gypsum Mine Investigation Report, prepared by GHD, and dated May 2016.

5.4 Groundwater Quality

The groundwater quality monitoring program for the current monitoring period was performed by GHD. A sample key for the groundwater samples collected and analyzed during the current monitoring period is presented in Table 5.2 and the groundwater quality results for the reporting period are provided in Tables 5.4, 5.5 and 5.6 for the shallow overburden, basal overburden/shallow bedrock, and bedrock wells respectively.

Although not a requirement for Site compliance, the discussion of water quality includes an evaluation of analytical results against the criteria listed in the Technical Support Document for Ontario Drinking Water Standards, Objectives and Guidelines, published by the MECP in June 2003, and revised in June 2006 (ODWS). The ODWS includes operational guidelines (OG), aesthetic objectives (AO), maximum acceptable concentrations (MAC), and interim maximum acceptable concentrations (IMAC) are used. Where an ODWS criterion was not available, criteria has been used from Table 2 of the *Soil, Ground Water and Sediment Standards for Use Under part XV.1 of the Environmental Protection Act*, dated April 15, 2011. This evaluation is provided for information and comparative purposes only.

Groundwater quality at the Site is assessed in terms of the presence and magnitude of potential effects from landfilling on groundwater quality primarily through examining the spatial and temporal patterns in leachate indicator parameter concentrations. For the purposes of the Site groundwater, alkalinity, boron, chloride, DOC, hardness, sodium and TDS have been selected as appropriate leachate indicator parameters (identified in Section 5.2.2.). To aid in the assessment, concentration versus time plots of these parameters for each groundwater monitoring well are provided in Appendix G-2.

It is noted that a portion of the sample results for the June 2022 sampling event (June 1 through 3, 2021) had to be “qualified” due to the loss of the field collection records. In the absence of the field documentation, the laboratory results for the June groundwater sampling event was evaluated and assigned to their “most likely” sampling location (when sample location could not be determined by the sample ID) based on the typical sampling location collection sequence conducted by the Technician, and on a comparison with historical results at each location. The results from these events are noted as being “qualified” on the referenced summary tables utilizing underlining and the addition of “**” at the end of the sample ID.

An assessment of the groundwater quality relative to the Reasonable Use Criteria (RUC) at boundary monitoring wells is discussed in Section 6.1 and presented in Tables 6.1 to 6.4.

5.4.1 Shallow Overburden Unit

The shallow overburden unit is assessed using groundwater quality data collected from ten on-Site (MW1B-13, MW2B-07, OW1B-06, OW3B-13, OW5B-06, OW8B-06, OW9B-06, MW10B-18, MW11B-19, MW12B-19) and two off-Site (MW5B-09, MW6B-07) shallow overburden wells. As previously indicated monitoring well MW2B-07 was noted

as dry during the May and November monitoring events, and MW5B-09 and MW12B-19 were noted as dry during the November monitoring event.

Monitoring wells MW1B-13, OW3B-13 and OW9B-06 are located upgradient relative to the landfill. Accordingly, water quality from these locations is interpreted to represent water quality flowing on-Site from upgradient. As OW3B-13 is located further from the landfill footprint than OW9B-06 and further from Brooks Road than MW1B-13, OW3B-13 represents the most conservative upgradient location. As such, the water quality data from this well has been included on the concentration versus time plots in Appendix G-2 so that comparison of water quality at each location to OW3B-13 can be made.

General Chemistry and Metals analytical results are summarized in Table 5.4A. Organics (VOCs and PAHs) results are summarized in Table 5.4B. Historical data is provided in Appendix G-1.

The following paragraphs describe the observations of shallow overburden water quality during the current monitoring period.

North Side of Landfill (Upgradient)

Water quality at MW1B-13 is generally similar to that observed at OW3B-13, however concentrations of chloride, sodium and TDS continue to be higher at this location. The proximity of this well to Brooks Road is interpreted to be the reason for these elevated parameters as road salt application on Brooks Road is a source of these parameters, particularly in shallow groundwater. Hardness is also elevated at MW1B-13 but with low concentrations of alkalinity, boron, and DOC, this is not interpreted to be related to the landfill.

Water quality at OW9B-06 is generally similar to that at OW3B-13, although concentrations of sodium and chloride are slightly elevated. Concentrations of sodium and chloride have been slowly increasing at this location since 2010 but have been generally stable or decreasing since 2019. The well is located in close proximity to the landfill; however, the water quality results do not suggest significant impairment of shallow groundwater at this location as the remainder of indicator parameters are at or not significantly elevated over background levels. Concentrations of alkalinity are slightly elevated over levels reported at OW3B-13 however alkalinity levels have remained relatively stable suggesting that the landfill is not the source of the slightly elevated alkalinity or increasing chloride observed. In addition, alkalinity concentrations are similar to those reported at historical background monitoring well OW1B-07.

Sulphate concentrations at MW1B-13 are elevated. Historically, sulphate has been frequently reported in samples from this well at concentrations greater than 1,000 mg/L. Similar sulphate levels have also been reported at OW9B-06. The absence of other leachate indicator parameters suggest that these levels are naturally occurring. Elevated sulphate levels are also observed within shallow overburden groundwater elsewhere on the Site. The source of the sulphate concentrations is suspected to be the influence of basal overburden/shallow bedrock flow zone water quality, as this flow zone frequently exhibits sulphate concentrations greater than 4,000 mg/L at the nested basal overburden/shallow bedrock monitoring well MW1A-13. Sulphate concentrations in the basal overburden/shallow bedrock unit are greater than 2,000 mg/L at most monitoring locations.

East Side of Landfill

MW2B-07 is a shallow overburden groundwater monitoring well located along the east side of the landfill. MW2B-07 was dry in November 2021.

Water quality at MW2B-07 shows evidence of influence from landfilling with slightly elevated concentrations of chloride, sodium, hardness and TDS. There is some evidence of a trend of increases in these parameter concentrations during recent monitoring events. Continued monitoring will provide additional insight into this potential trend.

Elevated naturally occurring concentrations of sulphate at this location represents substantial proportions of the elevated TDS reported.

West Side of Landfill

Monitoring wells MW1-03, MW2-03, MW3-03 and MW10B-18 are shallow overburden groundwater monitoring wells located to the west of the landfill. These monitoring wells are located in close proximity to Brooks Road. Since the beginning of 2019, MW1-03, MW2-03, and MW3-03 have been included in the monitoring program for hydraulic monitoring purposes only.

As illustrated on the concentration versus time plots included in Appendix G-2, water quality at MW1-03, MW2-03 and MW3-03 has not been assessed since fall 2018. Groundwater quality at these wells is similar to background water quality other than trends of increasing sodium, chloride and TDS. The source of these increases is interpreted to be road salt application along Brooks Road. This is consistent with previous interpretations.

Water quality at MW10B-18 is also essentially at background levels, except for chloride concentrations. In the absence of other indicators of landfill-related impacts, the mildly elevated chloride concentrations are not interpreted to be landfill-related.

South Side of Landfill

Monitoring well OW5B-06 is located to the south of the landfill approximately 80 m from the landfill footprint and 50 m upgradient of the south Site boundary. Water quality at OW5B-06 was historically consistent with background water quality, however trends of increases in chloride, sodium, hardness, TDS and to a lesser extent boron, were observed between 2013 and 2016. Since 2016 water quality has demonstrated decreasing trends in these parameters. The source of these trends in water quality is not known at this time. It should be noted that elevated concentrations of sulphate at this location represent a substantial proportion of the TDS concentrations reported.

Considering the improvements in water quality at this location during recent monitoring years, it is recommended that monitoring continue, and future reports consider the historical context of trends in water quality at this location. A discussion of the geochemical characteristics of water quality at select monitoring wells is provided under *Geochemical Fingerprint – Piper Diagram*, below.

Water quality at OW1B-06 is similar to background levels, however, increases in chloride concentrations have been observed between 2014 and 2016. This pattern is similar to that observed at OW5B-06, located to the east of OW1B-06. Hardness, sodium and to a lesser extent TDS, are slightly elevated above background levels. Elevated sulphate concentrations contribute to the elevated TDS concentrations reported.

Water quality at OW8B-06 is similar to background water quality, with slightly elevated chloride, sodium and TDS. This monitoring well is located in close proximity to Brooks Road and road salt is likely a source of these parameters at this monitoring well. Boron concentrations are slightly elevated over background levels. Other leachate indicator parameters are at or near background levels. In May 2020, chloride, sodium, and TDS increased sharply (particularly chloride). The concentrations of these parameters have decreased since May 2021 but remain elevated above historical concentrations. The sudden increase may indicate well integrity issues. The well seal should be inspected thoroughly during the spring 2022 monitoring event.

Monitoring wells MW11B-19 and MW12B-19 were installed in proximity to the south Site boundary in 2019 and therefore have limited groundwater results. Water quality at MW11B-19 shows evidence of influence from landfilling with slightly elevated but stable concentrations of alkalinity, boron, hardness, and TDS. Sodium concentrations are elevated above OW3B-13 background concentrations and are increasing.

Water quality at MW12B-19 shows evidence of influence from landfilling with slightly elevated but stable concentration of alkalinity, boron, hardness, sodium and TDS.

Sulphate concentrations are elevated at both monitoring wells MW11B-19 and MW12B-19, suggesting that water quality at these locations is naturally poor, contributing to the elevated TDS concentrations reported.

Organics

In June 2021, PAH detections were identified from samples collected from shallow monitoring wells MW2B-07, MW5B-09, OW3B-13, OW8B-06 for parameters including: 1-Methylnaphthalene/2-Methylnaphthalene,

Benzo(a)anthracene, Benzo(a)pyrene, Benzo(b)fluoranthene/Benzo(j)fluoranthene, Benzo(k)fluoranthene, Chrysene, Fluoranthene, Phenanthrene, and Pyrene. Benzo(a)pyrene concentrations at MW2B-07 (0.022 µg/L) and OW8B-06 (0.057 µg/L), located to the east and south of the landfill, respectively, were identified above the ODWS of 0.01 µg/L for the June 2021 samples. Benzo(a)pyrene has historically been detected above the ODWS at these locations. No other exceedances of PAHs were identified.

In May 2020, chloroform was detected at MW11B-19 (2.7 µg/L) above the ODWS of 2.4 µg/L. Concentrations in June 2021 decreased and were detected at 1.4 µg/L. There were no other detections of VOCs reported in any samples from 2021. PAH and VOC parameter concentrations at shallow overburden unit monitoring wells are presented in Table 5.4B.

Geochemical Fingerprint – Piper Diagram

In order to supplement the evaluation of potential landfill-related impacts to shallow overburden groundwater quality, an analysis of the geochemical “fingerprints” of shallow groundwater quality and leachate was undertaken. This analysis was accomplished through plotting major anion and cation on a Piper diagram for the June 2021 shallow overburden unit groundwater chemistry (Figure 5.7). A Piper diagram presents the major ions as percentages and is used to determine patterns in the geochemical character of water samples. Cations (positive ions) and anions (negative ions) are potted in two triangles at the base of the diagram. The compositions from the base triangles are then projected up to the central diamond. This central diamond therefore presents the data from all of the major ions on a single plot. On a Piper diagram, samples with similar geochemical character will plot relatively close to one another. Because the major ions are used, a Piper diagram is useful for detecting large differences in the geochemical characteristics between water samples. Data on the central diamond presents a line of evidence that assists in interpreting the likelihood of a monitoring location being affected by landfill-derived impacts. The likelihood of impacts can be gauged by the monitoring well’s proximity to leachate and other locations showing definite leachate-derived impacts. The following shallow overburden monitoring wells are used to plot the Piper diagram: MW1B-13, OW3B-13, OW9B-06, MW2B-07, MW10B-18, OW8B-06, OW1B-06, OW5B-06, MW11B-19, and MW6B-07.

The Piper diagram demonstrates that the pattern of major ions associated with the leachate chemistry is different from the pattern of major ions observed in shallow overburden monitoring wells. It is important to note that OW5B-06 (located immediately downgradient of the landfill footprint) plots far away from the leachate source. This pattern indicates that the elevated concentrations of analytes within groundwater, including OW5B-06, are not likely attributable to leachate migration beyond the landfill footprint. This finding is further substantiated with the apparent immobility of groundwater chemistry in the shallow overburden groundwater, as historically observed around the decommissioned OLA.

5.4.2 Basal Overburden/Shallow Bedrock Unit

The basal overburden/shallow bedrock unit was assessed in 2021 based on groundwater monitoring data collected from ten basal overburden/shallow bedrock monitoring wells, as listed in Table 5.2. Of these monitoring wells, ten are located throughout the Site (MW1A-13, MW2A-01, OW1A-06, OW3A-13, OW5A-06, OW8A-06, OW9A-06, MW10A-18, MW11A-19, MW12A-19), and of the three off-Site basal overburden/shallow bedrock monitoring wells, two (MW5A-09, MW6A-07) are located approximately 150 m south of the Site, and one (MW4A-09) is located to the west of, and in close proximity to the OLA. Since the beginning of 2019, MW4A-09 has been included in the monitoring program for hydraulic monitoring purposes only. Off-Site groundwater monitoring of the basal overburden/shallow bedrock unit downgradient of the Site is currently monitored at MW5A-09 and MW6A-07.

General Chemistry and Metals analytical results are summarized in Table 5.5A. Organics (VOCs and PAHs) results are summarized in Table 5.5B. Historical data, including concentration versus time plots of landfill indicator parameters are provided in Appendix G.

5.4.2.1 On-Site Basal Overburden/Shallow Bedrock Monitoring

Monitoring wells MW1A-13, OW3A-13 and OW9A-06 are located upgradient relative to the landfill. Accordingly, water quality from these locations is interpreted to represent water quality flowing on-Site from upgradient. Water quality

data from OW3A-13 has been included on the concentration versus time plots in Appendix G-2 so that comparison of water quality at each location to OW3A-13 can be made.

It is noted that water quality within the basal overburden/shallow bedrock flow zone is generally poor, including at upgradient monitoring locations. Concentrations of alkalinity, sulphate, hardness and TDS are all naturally elevated, often well above their respective ODWS.

The following paragraphs describe the observations of basal overburden/shallow bedrock groundwater quality during the current monitoring period.

North Side of Landfill (Upgradient)

Water quality at upgradient monitoring wells MW1A-13, OW3A-13 and OW9A-06 is generally poor with elevated concentrations of alkalinity, sulphate, hardness and TDS. Water quality, though variable, is generally stable over time. Concentrations of chloride and sodium decreased significantly between 2013 and 2016 at MW1A-13.

East Side of Landfill

MW2A-01 is completed within the basal overburden/shallow bedrock flow zone along the east side of the landfill. Water quality at this location is similar to that observed upgradient of the landfill. There is no indication of landfill-related water quality alterations at this location.

West Side of Landfill

MW4A-09 and MW10A-18 are completed within the basal overburden/shallow bedrock flow zone along the west side of the landfill. Water quality at this MW4A-09, prior to 2019, is similar to that observed upgradient of the landfill. There is no indication of landfill-related water quality alterations at this location. This location is currently used for hydraulic monitoring purposes only.

Water quality at this MW10A-18 is similar to that observed upgradient of the landfill. There is no indication of landfill-related water quality alterations at MW10A-18.

South Side of Landfill

Monitoring wells OW1A-06, OW5A-06, OW8A-06, MW11A-19 and MW12A-19 are completed within the basal overburden/shallow bedrock flow zone to the south of the landfill. Water quality at OW1A-06, OW5A-06 and OW8A-06 continues to be similar to upgradient and demonstrates no evidence of impact from the landfill.

Monitoring wells MW11A-19 and MW12A-19 were installed in mid-2019 have been sampled five and four times, respectively. Sample results suggest water quality is similar to upgradient locations and unaffected by the landfill. The November 2020 results from MW11A-19 show elevated concentrations of alkalinity and DOC. In 2021, alkalinity and DOC were similar to background water quality indicating that the fall 2020 results are not consistent with the previous two samples and following two sampling events.

Organics

During the current monitoring period, for comparison and informational purposes, all VOC and PAH parameter concentrations at basal overburden/shallow bedrock monitoring locations were below their respective ODWS and Table 2 criteria as shown in Table 5.5B. In light of the general absence of evidence of landfill-related water quality impacts in this flow zone, the occasional low-level detections of VOCs or PAHs reported in these monitoring wells are not considered to be landfill-related.

5.4.2.2 Off-Site Basal Overburden/Shallow Bedrock Aquifer Monitoring

Basal overburden/shallow bedrock aquifer monitoring wells MW6A-07 and MW5A-09 were installed to monitor water quality downgradient of the Site. The 2021 monitoring results for general chemistry and metals are provided in Table 5.5A. During the current monitoring period, for comparison and informational purposes, all VOC and PAH parameter concentrations at off-Site basal overburden/shallow bedrock monitoring locations were below their

respective ODWS and Table 2 criteria as shown in Table 5.5B. Phenanthrene was detected in the groundwater at monitoring well MW5A-09 in May 2020 and June 2021. In light of the general absence of evidence of landfill-related water quality impacts in this flow zone, the occasional low-level detections of VOCs or PAHs reported in these monitoring wells are not interpreted to be landfill-related. Historical data, including concentration versus time plots for leachate indicator parameters, are provided in Appendix G.

In general, the results from these monitoring wells are consistent with current and historical observations obtained from on-Site basal overburden/shallow bedrock monitoring locations. The concentration versus time plots provided in Appendix G-2 illustrate that water quality at these monitoring locations is very similar to that observed upgradient of the landfill.

On the basis of the pattern in water quality observed at MW6A-07 and MW5A-09, there is no evidence of landfill-related water quality impacts in the basal overburden/shallow bedrock water quality off-Site.

5.4.3 Bedrock Unit Monitoring

The bedrock unit is monitored through groundwater monitoring data collected from six on-Site bedrock monitoring wells (MW1S-07, MW1D-07, MW2S-07, MW2D-07, OW8S-07, OW8D-07). The bedrock unit is divided into two hydraulic units (intermediate bedrock and deep bedrock). In general, the water quality in the bedrock units is poor and comparable to the basal overburden/shallow bedrock aquifer unit.

General Chemistry and Metals analytical results are summarized in Table 5.6A. Organics (VOCs and PAHs) results are summarized in Table 5.6B. Historical data, including concentration versus time plots of landfill indicator parameters are provided in Appendix G.

It should be noted that MW1S-07 was not sampled following the 2017 monitoring events due to excessive sediment infilling within the monitoring well. The source of the infilling is suspected to be re-grading undertaken around the well during 2018. Water quality results following the monitoring well repair in August 2019 are comparable with historic ranges.

Water quality in the bedrock unit is poor and is characterized by elevated concentrations of hardness, sulphate, TDS, boron, iron, and manganese. These parameters generally exceed their respective ODWS. Water quality is generally stable at each monitoring well, with the exception of some variability noted at monitoring well MW1D-07.

A comparison of nested wells illustrates that water quality in the deep and shallow well nests for are generally similar in quality for leachate indicator parameters for MW1D/S-07 and MW2D/S-07 well nests. Water quality from the deep bedrock location OW8D-07 is characterized by lower alkalinity and sodium, and higher boron and chloride compared to the other five bedrock monitoring wells locations.

Based on the pattern of leachate indicator parameter concentrations in the bedrock unit monitoring wells, there is no evidence of landfill-related water quality impacts in the bedrock unit.

Sample results from bedrock unit monitoring wells, in particular monitoring well MW1D-07 and MW1S-07, have historically reported low-level detections above the ODWS of various PAH parameters. In light of the absence of landfill-related impacts, and the multiple flow zones between this monitoring well and the landfill, the PAH detections are considered unrelated to the landfill.

5.5 Surface Water Quality

The 2021 surface water quality monitoring program was performed by GHD. A sample key of the surface water samples collected and analyzed is presented in Table 5.7 and a summary of the surface water quality results for the 2017 through 2021 monitoring periods is provided in Tables 5.8A and 5.8B. Assessment of the potential influence of leachate impacts on surface water quality is undertaken primarily through comparing the pattern of leachate indicator parameter concentrations at each monitoring station against the criteria listed in the Water Management Policies, Guidelines, Provincial Water Quality Objectives (PWQO), published by the MECP in July 1994, and reprinted February 1999 is also presented in this Section.

Historical surface water quality results are provided in AppendixG-1. Concentration versus time plots of leachate indicator parameters at each surface water monitoring station are included in Appendix G-2.

The surface water monitoring locations include three off-site background locations: SW1, SW8, and SW9. All three have been established to document the background water quality in the local ditches and ponds. The on-Site surface water monitoring locations include one pond (SW5) located in the southern portion of the Site and one on-Site surface water ditch (SW2) located at the discharge from the Site SWMS. Off-Site surface water monitoring locations include two ponds (SW6 and SW7) located to the south of the Site, one drainage ditch located immediately downstream of the Site discharge point (SW3), and one drainage ditch (SW4) situated approximately 1 kilometre (km) south and downstream of the Site. SW9 is located immediately north of the Site, north of OW3A/B-13.

Throughout the year, many of the surface water locations are generally dry or not flowing. In March 2021, SW4 was the only surface water location that had a sample collected from flowing conditions. The surface water monitoring locations sampled during the current monitoring period are presented on Figure 4.1. The following provides a summary of the surface water quality for the reporting period.

5.5.1 Background Surface Water Quality

The location of SW1 is west of Brooks Road, and approximately 300 m north of the Site, as presented on Figure 4.1.

The concentration versus time plots included in Appendix G-2 present the historical pattern in leachate indicator parameter concentrations at background monitoring stations SW1 and SW8. The concentration patterns demonstrate that leachate indicator parameters exhibit significant variability, which is likely attributable to seasonal effects and the sensitivity of surface water quality to precipitation and run-off.

Samples obtained from SW1 are used to assess the quality of the background surface water in the local ditches in the vicinity of the Site. The high variability in chloride, sodium, and TDS concentrations at SW1 is likely attributable to seasonal road salt application along Brooks Road.

SW8 is located in an off-Site pond approximately 230 m south of the Site and approximately 310 m east of Brooks Road. This pond is not hydraulically connected to the Site and, due to its distance from the Site and Brooks Road, the water quality in this pond is considered background for assessing surface water quality on and in the vicinity of the Site. Water quality at SW8 exhibits lower variability than that observed at SW1, particularly for chloride, sodium, and TDS. Due to the location of SW8, water quality at this station is not likely affected by road salt. A pattern of increases in DOC concentrations is apparent at SW8. The increase is not landfill related but may be related to a buildup of organic, plant, material in the pond.

SW9 was installed in May 2020. The analytical results at SW9 indicate variable water quality that has been influenced by turbidity, such as elevated alkalinity, hardness, and total dissolved solids. Additional data is required to comment on the usefulness of the additional surface water monitoring station.

During the current monitoring period, VOC and PAH parameter concentrations were not detected above laboratory reporting limits at background surface water monitoring locations.

The background surface water monitoring results collected from SW1 and SW8 during 2021 were generally consistent with historical results.

5.5.2 On-Site Surface Water Quality

SW5 is located on-Site in a low-lying area where ponded water is frequently observed. The concentration versus time plots included in Appendix G-2 illustrate that water quality at SW5 is largely similar to that observed at the background monitoring locations.

Water quality at SW5 is essentially within historical background levels with similar parameter concentration ranges and demonstrating a degree of variability. At SW5 the following parameters did not meet their respective PWQO during the current monitoring period: field measured dissolved oxygen, total phenolics, phosphorus, aluminum, chromium, and iron. SW5 has historically exhibited elevated concentrations of boron over background concentrations.

In general, concentrations of parameters detected at SW5 during the 2021 monitoring period were similar to those noted at background locations SW1 and SW8. With the exception of toluene in November, there were no VOC or PAH parameter concentrations detected above the laboratory method reporting limits at SW5 during the current monitoring period.

The surface water monitoring results collected from SW5 during 2021 were generally consistent with historical results.

5.5.3 Downstream Surface Water Quality

Downstream surface water quality is assessed at five monitoring stations (SW2, SW3, SW4, SW6, and SW7). SW2 is located at the point of discharge from the SWMS and an on-Site swale adjacent to the Site entrance to the off-Site ditch along Brooks Road. Two surface water monitoring stations (SW3 and SW4) are located within drainage ditches downgradient of the Site. SW3 is located immediately downstream near the southwest corner of the Site and SW4 is located approximately 1,040 m south of the southeast corner of the Site. Two off-Site areas of ponded water (SW6 and SW7) are included in the monitoring program. SW6 is located immediately to the south of SW5, and SW7 is located south of the west-half of the Site.

SW2 was established in 2019 following completion of the final configuration of the SWMS. As illustrated on the concentration versus time plots included in Appendix G-2, the initial water quality results for SW2 demonstrate water quality that is within background ranges for leachate indicator parameters with the exception of elevated boron and hardness. No VOC parameter concentrations were detected above laboratory reporting limits at SW2 during the current monitoring period. SW3 was sampled once in 2021 (June). The leachate indicator parameter concentrations presented on the concentration versus time plots included in Appendix G-2 suggest water quality at this monitoring point shows concentrations of alkalinity, hardness, chloride, and TDS slightly over background levels during the current monitoring period. Water quality at this location has demonstrated variability in terms of alkalinity, chloride, and TDS concentrations. This variability is similar to that observed at SW1 and reflects the sensitivity of surface water quality in drainage ditches to runoff and precipitation as well as seasonal sources of impacts like road salt application. Since 2019, there has been an increasing trend in sodium concentrations. No VOC parameter concentrations were detected above laboratory reporting limits at SW3 during the current monitoring period.

Surface water monitoring location SW4 is located downstream of SW3. Water quality at SW4 is essentially at background levels with similar parameter concentrations ranges and demonstrating a degree of variability. At SW4 the following parameters did not meet their respective PWQO during the current monitoring period: field measured dissolved oxygen, phenolics, phosphorus, aluminum, chromium, and iron. The concentrations of these parameters at SW4 are similar to historical concentration ranges reported in background surface water quality. There were no VOC or PAH parameter concentrations detected above the laboratory reporting limit during the current monitoring period at SW4.

Based on the water quality results at SW4 during 2021, there is no evidence of landfill-related water quality impacts at this location.

SW6 is located in ponded water off-Site to the south of SW5. As illustrated on the concentration versus time plots provided in Appendix G-2, SW6 leachate indicator parameter concentrations, with the exception of boron and hardness, are within historical background ranges and variability. At SW6 the following parameters did not meet their respective PWQO during the current monitoring period: total phenolics, phosphorus, aluminum, boron, chromium, iron, and fluoranthene. The concentrations of these parameters are similar to concentrations reported in historical background surface water quality.

During the June 2021 monitoring, the following PAH parameters were detected at SW6: benzo(a)pyrene, benzo(b/j)fluoranthene, fluoranthene, and pyrene. No PAHs were detected above the laboratory reporting limits during the November 2021 monitoring event. No VOC parameter concentrations were detected above the laboratory reporting limit during the current monitoring period at SW6. In the absence of other significant indications of leachate-related surface water quality impacts, the PAH detections reported are not considered to be related to the leachate impacts. Elevated PAHs may be related to historic slag stockpiles in the vicinity of the Site and the use of road ballast along the Site entrance. The exact source of the detected parameters is not known.

At SW6, hardness has been elevated since 2013 and boron has been demonstrating an increasing trend since 2012, with the exception of the November 2021 boron concentration result. With the exception of boron and hardness, water quality results at SW6 during 2021 indicate no evidence of landfill-related water quality impacts at this location.

Monitoring location SW7 is located to the south of the Site within a pond located approximately 50 m to the east of Brooks Road. As illustrated on the concentration versus time plots in Appendix G-2, leachate indicator parameter concentrations at SW7 are generally similar to concentrations observed in background water quality. The occasional higher phosphorus concentrations in this pond are likely related to agricultural sources, as this pond is located adjacent to crop fields. Chloride, sodium and TDS are occasionally elevated over the levels observed at SW8 which is likely related to the proximity of SW7 to Brooks Road. At SW7 the following parameters did not meet their respective PWQO during the current monitoring period: pH, total phenolics, phosphorus, aluminum, boron, chromium, and iron. Concentrations of these parameters at SW7 are similar to concentrations historically reported in background surface water quality. There were no VOC or PAH parameter concentrations detected above the laboratory method detection limit during the current monitoring period at SW7.

Based on the water quality results at SW7 during 2021, there is no evidence of landfill-related water quality impacts at this location.

To conclude the discussion on surface water quality, minor surface water quality impacts are noted at SW3 and SW6 with elevated concentrations of hardness and boron, and several PAHs at SW6. These impacts are limited in extent as they are not observed at the downstream monitoring station SW4; albeit SW4 is located a considerable distance downstream. Based on the pattern in water quality at SW3 and SW6, the source of these impacts does not appear to be leachate-related.

5.6 Surface Water Flows

Surface water flow velocity and depth/width of flow was measured at SW4 during the following March 2021 monitoring event. These measurements were used to estimate the flow rates at monitoring stations where flow was apparent. The results of the 2021 surface water flow monitoring are provided along with the field measured parameters in Table 5.8A.

5.7 Landfill Gas Monitoring Results

The 2021 LFG monitoring was performed by GHD in January, February, March, April, July, September, and December. Monitoring was performed at a total of 12 gas probes, including 4 nested pairs of gas probes (GP-1S, GP-1D, GP-2S, GP-2D, GP-3S, GP-3D, GP-4S, GP-4D) and 4 individual gas probes (GP5-19, GP6-19, GP7-19, GP8-19). The 2021 landfill gas monitoring results are presented in Table 5.9.

In accordance with ECA No. A110302, LFG monitoring results have been assessed in comparison to the following levels:

– Methane gas at the Site boundary to be less than 2.5 percent by volume (% v/v)
    - Consistent with the compliance level for LFG migration at the landfill site boundary with guidance from O.Reg. 232/98, and ECA No. A110302 Section 6.2.a.

In 2021 there were no detections of methane at the gas probes above 2.5% v/v. The 2021 monitoring results were generally consistent with historical monitoring data. The majority of gas probes were identified to be flooded during the monitoring period, as the water levels were measured to be above the top of the screen. Only an open screen will allow soil gas from the surrounding soil to enter a gas probe as water is general considered a barrier to gas migration. Gas composition readings were not collected from flooded gas probes as the monitoring results would not be considered representative of the surrounding soil gas conditions.

Below provides discussion of the 2021 LFG monitoring results.

– Gas probes, GP-1S, GP-1D, and GP5-19 are located near the northwest corner of the Site. The nearest off-Site dwelling/structure is a private property, which is located approximately 300 m to the northwest of the gas probes.
    - Gas probe GP1-S could not be monitored in 2021 due to a damaged lock and casing preventing access. It is recommended gas probe GP1-S is repaired so that monitoring can be continued.
    - Gas probe GP-1D was flooded during the monitoring period. Gas composition readings were not collected from gas probe GP1-D as the monitoring results would not be considered representative of the surrounding soil gas conditions.
    - Gas probe GP5-19 was operational during the January, April, and December monitoring events. Methane was not detected at gas probe GP5-19 in January and April as concentrations were less than 0.3% v/v. Methane was detected at a concentration of 0.7% v/v during the December monitoring event, which is less than the ECA requirement of 2.5% v/v methane at the Site boundary. GP5-19 was flooded during the other monitoring events, and therefore no gas readings were obtained.
– Gas probes GP-2S and GP-2D are located west of the landfill between GP-3S/D and GP-1S/D.
    - GP-2D was identified to be blocked at ground surface during the current monitoring period, and therefore no gas readings were obtained. It is recommended the owner consider repairing the gas probe so that monitoring can be continued.
    - Gas probe GP-2S was flooded during the monitoring events in the monitoring period, and therefore no gas readings were obtained.
– Gas probes GP-3S and GP-3D are located between the landfill and the on-Site trailers. GP-3D and GP-3S were flooded during the current monitoring period, and therefore no gas readings were obtained.
– Gas probes GP-4S, GP-4D, and GP7-19 are located in proximity to the SWMS pond and LTS effluent holding tanks.
    - Gas probe GP-4S was flooded during the monitoring events in the monitoring period, and therefore no gas readings were obtained.
    - GP-4D was operational during the February, March, April, July, and September monitoring events. Methane was not detected at GP-4D as concentrations were less than 0.3% v/v. GP-4D was flooded during the other monitoring events, and therefore no gas readings were obtained.
    - GP7-19 was operational during the January, February, March, and July monitoring events. Methane was not detected at GP7-19 as concentrations were less than 0.3% v/v. GP7-19 was flooded during the other monitoring events, and therefore no gas readings were obtained.
– Gas probe GP6-19 is located in the vicinity of the on-Site office/maintenance building. GP6-19 was operational during all monitoring events in the monitoring period. Methane was not detected at GP6-19 as concentrations were less than 0.3% v/v.
– Gas probe GP8-19 is located adjacent to the leachate treatment system. GP8-19 was flooded during the monitoring events in the monitoring period, and therefore no gas readings were obtained.

5.8 Industrial Sewage Works Monitoring Results

The Site also operated under an amended Industrial Sewage Works ECA No. 1122-BKUPSM (dated February 3, 2020) for the SWMS and leachate collection, treatment, and disposal system. During 2021 stormwater from capped portions of the waste disposal area was directed towards the SWMS.

The LTS is operated by CWI. CWI prepared a 2021 Annual Report (CWI Report) which provides a summary of the LTS including a description and operational parameters as required in the Industrial Sewage Works ECA. The following summarizes the CWI Report:

1. Influent leachate samples were collected on a monthly and quarterly basis for respective required parameters.
2. The annual average treatment system flow rate was 41 m^3/day, and the peak treatment system flow rate was 88 m^3/day. The peak daily flow rate is below the treatment system rated capacity of 200 m^3/day.

3. Operational problems were encountered and addressed.
4. Routine maintenance was conducted.
5. There were no bi-pass or abnormal discharges during the reporting period.
6. No treated effluent was discharged to the roadside ditch from the LTS in 2021.

A copy of the 2021 annual report prepared by CWI is presented in Appendix H.

6. Groundwater and Surface Water Compliance Assessment

6.1 Groundwater

6.1.1 Evaluation of Site Using RUC

In 2015, GHD undertook a detailed review of the available database of groundwater and leachate quality data for the Site. The purpose of this review was to use this information in the development of a Site-specific Trigger Level Program (TLP) and Contingency Response Plan (CRP). Updated D&O report was submitted and approved in December 2018. Additionally, an updated D&O report submitted and approved in June 2021 in support of an application for approval of an amendment to the ECA. The updated D&O report included a revised TLP and CRP. Appendix I includes the results of this review and outlines the updated TLP and CRP for the Site. The purpose of the TLP is to provide timely identification of potential Site-related water quality impairment and in turn permit implementation of appropriate contingency measures to mitigate the potential for non-compliance.

Groundwater compliance at the Site is based on Site boundary groundwater quality and how it compares to Site-specific Reasonable Use Concept (RUC) criteria. The RUC criteria are calculated from generic ODWS and background concentrations. For the purposes of the TLP, 85 percent of the Site-specific RUC criteria are used as the trigger levels. Accordingly, the TLP is intended to provide advance warning of potential Site groundwater compliance issues.

The RUC criteria are re-calculated annually as more data is added to the database. The RUC criteria used for this assessment were established using background water quality data collected from monitoring wells located upgradient of the landfill. The RUC established for the shallow overburden unit was derived from background groundwater quality data gathered at MW1B-01/MW1B-07/MW1B-13, OW3B-85/OW3B-07/OW3B-13, and OW9B-92/OW9B-06 as summarized in Table 6.1. The RUC established for the basal overburden/shallow bedrock unit were derived from background groundwater quality data gathered at MW1A-01/MW1A-07/MW1A-13, OW3A-85/OW3A-07/OW3A-13, and OW9A-06, as summarized in Table 6.2. The revised calculated RUCs are based on the average median concentration (median 2017 - 2021 concentrations for each parameter at each location are averaged) reported in the background/upgradient monitoring wells, except for PAH and VOC parameters, which were assigned a concentration value of zero, as recommended by the MECP.

In previous reports, OW5B-06 was included as a southern boundary shallow monitoring well. Exceedances of the chloride trigger level were historically noted at OW5B-06 and an evaluation of the degree, nature, and potential source(s) of the water quality impact(s), was undertaken during 2018-2019. Based on the evaluation undertaken in response to consecutive trigger level exceedances, a recommendation was made to install additional monitoring wells on the southern property boundary, downgradient of OW5A/B-19. Monitoring wells MW11A/B-19 and MW12A/B-19 were installed in 2019 and have been incorporated into the environmental monitoring program. In light of the installed southern property boundary monitoring wells, OW5A/B-06 were removed from the Site's trigger level program.

As noted in Appendix I, the following parameters were selected as trigger parameters for groundwater quality:

– General Chemistry: chloride
– Metals: boron, chromium, lead
– PAHs: naphthalene, phenanthrene, pyrene, benzo(a)pyrene
– VOCs: benzene, ethylbenzene, toluene

The following subsections discuss the results of the 2021 TLP for groundwater in the shallow overburden unit and basal overburden/shallow bedrock unit.

6.1.2 Shallow Overburden Unit

The groundwater impact assessment undertaken for the current monitoring period for the Site has focused on shallow overburden wells located downgradient of the current landfill, including the western boundary of the Site (MW10B-18), the eastern portion of the Site (MW2B-07), and along the southern boundary of the Site (OW1B-06, OW8B-06, MW11B-19, and MW12B-19).

Table 6.3A provides a comparison of the 2021 data at the shallow overburden unit boundary wells to the calculated Trigger Levels, with exceedances of Trigger Levels highlighted. As noted in Table 6.3A, all results were below their respective trigger levels with the following exceptions:

– Chloride concentrations at OW8B-06 during the June and November 2021 monitoring events.
– Boron concentrations at OW8B-06 during the November 2021 monitoring event.
– Benzo(a)pyrene at OW8B-06 during the June 2021 monitoring event.

Monitoring well OW8B-06 is located south of the landfill footprint in the southwest corner of the property, adjacent to Brooks Road. As indicated in the TLP included in Appendix I, Tier II monitoring is triggered when a parameter exceeds its respective trigger level at a single trigger location in two consecutive sampling events.

Although the chloride trigger level continues to be exceeded at OW8B-06 (four consecutive sampling events throughout 2020 and 2021), the proximity of this well to Brooks Road is interpreted to be the reason for these elevated chloride as road salt application on Brooks Road is a source.

Benzo(a)pyrene concentrations at OW8B-06 have historically been detected (2017 and 2018) and have fluctuated above and below the laboratory detection limit. Elevated PAHs are interpreted to be related to historic slag stockpiles in the vicinity of the Site and the use of road ballast along the Site entrance. The exact source of the detected parameters is not known.

A boron exceedance of the RUC was detected in November 2021. Boron concentrations from June 2021 were below the RUC. In the absence of other significant indications of leachate-related groundwater quality impacts and VOC detections, the chloride, benzo(a)pyrene and boron detections reported are not interpreted to be related to the landfill.

No RUC were exceeded for the trigger parameters at monitoring wells located on the property boundary.

6.1.3 Basal Overburden/Shallow Bedrock Unit

The basal overburden/shallow bedrock unit beneath the OLA is overlain by a clay aquitard of very low hydraulic conductivity, and thus the potential for water quality impact in this unit is minimal. For the 2021 monitoring period, the basal overburden/shallow bedrock included in the TLP (Appendix I) include wells located in the southern portion of the Site (OW1A-06, OW8A-06, MW11A-19, MW12A-19), the eastern portion of the Site (MW2A-01), and the western property boundary (MW10A-18).

Table 6.4A, provides a comparison of the 2021 data at the basal overburden/shallow bedrock unit boundary wells to the calculated Trigger Levels, with exceedances of Trigger Levels highlighted. As noted in Table 6.4A, all results for basal overburden/shallow bedrock unit trigger wells were below their respective trigger levels in all samples collected during 2021.

6.2 Surface Water (SWMS Pond)

During the 2021 monitoring period the Site-specific surface water TLP corresponded with Table 7 of the Industrial Sewage ECA. A copy of the Industrial Sewage ECA is available in Appendix B, and a summary of the surface water TLP and CRP is provided in Appendix I.

The surface water trigger parameters and corresponding levels from Table 7 of the Industrial Sewage ECA are presented as follows:

Table 7 – Trigger Parameters

Parameter	Trigger Level
Un-ionized Ammonia	0.02 mg/L
Arsenic	0.005 mg/L
Boron	1.5 mg/L
pH (unitless)	6.5 to 8.5

Samples collected from the SWMS Pond during routine quarterly monitoring and prior to discharge were compared to the trigger levels. The 2021 quarterly monitoring occurred on March 26, June 1, August 31, and November 12. Tabulated results of the 2021 monitoring of the SWMS Pond are presented in Table 5.10.

Laboratory analyzed pH (8.87) did not meet the trigger level on June 1, 2021, and the field measured pH (6.32) did not meet the trigger level on November 12, 2021. Condition 11 (10) of the Sewage ECA states that re-sampling of the SWMS Pond is required within 2 weeks of receipt of analytical data when an exceedance of the trigger level is identified. Confirmatory sampling of the pond was not conducted within 2 week of receipt of the pH exceedances from the SWMS Pond on June 1, 2021 or November 12, 2021 and this represents a non-conformance with this condition of the ECA.

The SWMS Pond analytical results were below the TLP for all parameters for the August 31, 2021 sampling event, collected between the March and November 2021 SWMS pond sampling events.

The remaining water quality results from the June and November samples do not suggest that there was any impact to water quality within the SWMS Pond on these occasions. On the basis of the water quality, there is no evidence of a discharge of impacted water off-site, despite the pH results reported.

7. Site Operations and Development

7.1 Site Operations

7.1.1 Daily Operations

Hours of operations are 6 am to 6 pm Monday to Friday and 6 am to 2 pm Saturdays. The hours for receiving waste are 7 am to 5 pm, Monday to Friday and 7 am to 1 pm Saturdays.

7.1.2 Site Entrance

The Site access is provided from Brooks Road via a driveway located approximately 30 m north of the south Site boundary. The main entrance is equipped with a lockable entrance gate to prohibit unauthorized vehicles from entering the Site.

A weigh scale is located inside the entrance gate. All waste haulage vehicles must pass over the scale when entering and leaving the Site.

A mobile office/site trailer is located at the Site entrance and is utilized for the Site operator and personnel responsible for daily landfill operations.

7.1.3 Volumes and Site Life

According to ECA A110302, the total waste disposal capacity for the Site is 1,045,065 m^3. BRE surveyed the landfill disposal area in December 2021. The remaining airspace as of December 2021 was calculated to be 180,553 m^3. Waste density was calculated based on total tonnage placed in 2021 (183,977 tonnes) and airspace consumed in 2021 (79,777 m^3); the corresponding apparent waste density is 2.31 tonnes/m^3. The higher apparent waste density in 2021 may be the result of waste consolidation.

Assuming waste filling at a rate between 150,000 to 250,000 tonnes per year and varying waste densities achieved, the remaining Site life is estimated at between 2.78 and 0.89 years.

The type of material received primarily consisted of non-hazardous contaminated soil. The following is a summary of the waste/contaminated soil received each month in 2021:

Month	Tonnes
January	17,384.87
February	11,422.56
March	19,380.59
April	15,127.59
May	17,430.50
June	19,072.45
July	15,336.13
August	11,921.25
September	8,177.94
October	12,533.00
November	19,859.67
December	16,331.91
Total	**183,977.34**

7.1.4 Daily Cover

During landfilling in 2021, non-hazardous contaminated soil was used as daily cover in accordance with the Landfill ECA; therefore, no additional soil from the on-Site stockpiles was used for daily cover.

7.1.5 Interim and Final Cover Works

Interim cover was applied to Stage 3 in 2021. Interim cover thickness varied between 300 mm and 750 mm. Interim cover soil was obtained from the on-Site stockpiles. Interim cover installation was completed in Stage 2 during 2021.

7.1.6 Engineered Controls

No additional engineered controls were installed in 2021.

7.1.7 Leachate Collection, Treatment and Removal

During the 2021 reporting period, leachate levels within the LCS were maintained to prevent mounding within the landfill. As previously indicated, the leachate is pumped from the LCS to storage tanks for on-Site treatment or hauled from the storage tanks to an off-Site licensed facility for treatment and disposal. The on-Site LTS treated 14,872 m^3 of leachate based on the CWI sewage treatment flow data. A total of 19,409.71 m^3 of treated leachate and contact water from Stage 3 was hauled off-Site for disposal in 2021.The following table provides a monthly summary of leachate treated and total effluent/contact water hauled off-Site in 2021.

Month	Treated Effluent (m^3)	Treated Effluent/Contact Water Hauled (m^3)
January	1,099	1,787.81
February	969	1,564.09
March	502	2,151.76
April	448	1,318.18
May	949	875.44
June	1,447	1,473.71
July	1,485	1,429.62
August	1,547	1,441.77
September	1,392	1,278.80
October	1,525	1,400.02
November	1,722	2,543.88
December	1,787	2,143.63
Total	**14,872**	**19,409.71**

Treated effluent was hauled to the Haldimand County Dunnville wastewater treatment plant in 2021. No effluent was directed to the Brooks Road ditch during the current reporting period.

In accordance with the LRP, the Site is required to reach leachate elevation targets annually. To be in compliance with the LRP and Landfill ECA Condition 5, the leachate elevation targets must be achieved within 15 days of the anniversary of the issuance of the Landfill ECA (March 27). As shown in Section 5.2.1, the leachate elevation has decreased in 2021 as a result of the leachate removal activities described above. Leachate levels as of March 12, 2021 (within 15 days of the compliance date of March 27, 2021) were below the targeted leachate level of 196 m AMSL as per the dates outlined in Schedule “C” and the capacity-based target of 195.7 m AMSL as per the estimated landfilled volume of 815,000 m^3 as outlined in Scheduled “D”.

The MECP issued Notice of Violation 1-90395772 on December 17, 2021. The Notice of Violation required the completion and submission of a Short-Term Leachate Removal Actions Summary to identify measures to be taken to address leachate elevations at the Site to meet the leachate elevations listed in Schedule “D” of ECA A110302. A copy of the Notice of Violation and is provided as Appendix J. BRE provided a response to the Notice of Violation on January 5, 2022.

7.1.8 Public Complaints

In accordance with the ECA, a Public Complaints Procedure was developed for the Site. The initial Public Complaints Procedure was revised to incorporate comments received from the Public Liaison Committee (PLC) and was approved, with amendments, by the PLC on December 15, 2004. An updated Public Complaints Procedure was prepared in accordance with the EA Notice of Approval and approved by the MECP in October 2020. A copy of the public complaint procedure is provided in Appendix K. A sign at the Site entrance provides a contact phone number for

registering complaints. Further contact details are provided on the BRE website. Complaints can also be registered 24 hours/day through the MECP's Spills Action Centre.

Based on information received from BRE and copies of correspondence provided to GHD, two odour complaints were documented in 2021. Verification activities and corrective actions were completed by BRE when possible. In the follow-up to several of the complaints, odours were not detected. The majority of the complaints were made to the MECP and by the time they were received by BRE it was unable to verify the complaint.

As indicated above, the complaints received from the public during the 2021 monitoring period were related to only to odour.

To reduce the potential for off-Site odour impacts, the following operational measures were recommended based on historical odour monitoring completed by GHD in 2016 and carried out by BRE during

– Continue with the odour monitoring program established by BRE.
– If odours are noted at the property boundary, increase the amount of daily cover applied on the waste.
– Minimize the active working face. Apply interim cover at a minimum thickness of 300 mm on areas of the landfill where landfilling has ceased for 6 months or more.
– Limit exposed areas of the leachate collection system and control passive odour emissions from the east above ground leachate storage tank.
– When not in use, ensure blind flanges are placed on leachate collection system cleanouts and sump risers.
– Use odour control granules as required to mitigate odour sources within the Site.
– Increase removal of leachate to lower the leachate level within the waste.

An Odour Management Plan (OMP), included the June 2021 D&O report, was prepared for persons engaging in activities at the Site to be aware of all odorous sources at the Site, potential causes of odourous emissions and to implement best practices and procedures to minimize odours. The OMP was followed in 2021.

7.1.9 Public Liaison Committee

As required by the ECA, a PLC was established in 2004 to serve as a forum for the dissemination of information, consultation, review and exchange of information regarding the operation of the Site. Due to COVID-19, PLC meetings were conducted in 2021 by way of electronic updates (e-updates). Three e-updates were provided in March, June and November 2021.

7.2 Site Development

The approved development plan for the Site is described in the reports entitled "Design and Operations Report, Edwards Landfill Site, Haldimand County, Ontario" dated November 2003 (D&O), "Updated Site Decommissioning Plan, Edwards Landfill Site" dated July 2010 (Decommissioning Report), Design and Operations Report Interim Expansion dated December 2018, Design and Operations Report Vertical Expansion dated April 2019, and Design and Operations Report Vertical Expansion – Rev. 1 dated June 2021.

The Site design provides for three disposal stages that were constructed in a progressive manner from east (Stage 1) to west (Stage 3). The landfill design has been laid out such that the Site entrance features, and Stage 1 could be constructed outside the limits of the OLA. The D&O report for the interim expansion (December 2018) provides for additional filling in Stage 4, located on top of a portion of Stages 1 and 2A. The D&O report for the vertical expansion provides for additional filling over the existing landfill footprint.

As the refuse/cover soil reaches final contours the final cover is to be constructed. In conjunction with final cover construction, the perimeter ditching is to be constructed to direct clean surface water runoff away from the active stage and into the SWMS Pond.

The final SWMS, including perimeter ditching, will be constructed in stages as landfilling progresses to final contours. Runoff from any landfill cell that has a completed interim cap will be conveyed to the constructed SWMS Pond via storm water ditching around the perimeter of the landfill.

7.2.1 Work Completed In 2021

Construction activities conducted in 2021 included the following main tasks:

– Operation of Dissolved Air Flotation Unit (DAF) unit pilot to increase leachate treatment plant output
– Installation of interim cover within portions of Stage 3
– onstruction of internal landfill access roads
– Interim cover installation in Stage 2
– Installation of perimeter animal exclusion and silt fencing
– Installation of screening berm along west side of Site

7.2.2 Regulatory Activities

In 2021, regulatory activities related to the Site included issuance of the amended Landfill ECA for the purpose of implementing the fill rate amendment. BRE was issued a Notice of Violation on December 17, 2021 relating to the management of leachate levels in the landfill.

7.3 Development Work Scheduled For 2022

Work scheduled for 2022 includes the following:

– Continual improvements to the permanent leachate treatment system
– Improvement to the road and entrance surfaces (asphalt paving) in accordance with the amended Landfill ECA

8. Financial Assurance

In accordance with Condition 2 of the Landfill ECA, the total financial assurance provided by BRE totals $9,956.333. A copy of the surety bond is provided in Appendix L. The bond is automatically renewed each year on December 20th on the same terms and conditions.

9. ECA Compliance Status

During the 2021 reporting period SWMS Pond laboratory analyzed pH did not meet the trigger level on June 1, 2021, and the field measured pH did not meet the trigger level on November 12, 2021. This represents a non-conformance with this condition of the ECA. Table 9.1 provides a summary of ECA conditions applicable to the Site during the 2021 reporting period and the compliance status.

10. Annual Monitoring Report Completion Checklist

Appendix M of the document entitled “Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water, Technical Guidance Document” (MECP, November 2010) includes a monitoring and screening checklist which is intended to provide the MECP with a quick reference for Site information and relevant monitoring results for the monitoring period. A completed checklist is provided in Appendix M of this report. As there is still some uncertainty regarding the nature of the declaration included in the checklist, the checklist has not been signed, but has been completed, as possible, and is included for reference.

11. Conclusions

Environmental Monitoring

a. This report covers the 2021 environmental monitoring data collected by GHD.
b. The 2021 environmental monitoring program consisted of leachate, groundwater, surface water, and gas probe sampling and monitoring.
c. Quarterly surface water monitoring events and semi-annual groundwater monitoring events were completed in 2021.

Leachate Levels and Water Quality

a. The leachate is generally characterized by elevated conductivity, alkalinity, COD, DOC, phenols, phosphorus, aluminum, arsenic, boron, chromium, iron, manganese, and sodium. Chloride is moderately elevated. The leachate also exhibits trace organics based on the presence of low concentrations of VOCs: benzene, cis-1,2-dichloroethene, ethylbenzene, xylenes (m&p, o), and toluene and PAHs: acenaphthene, anthracene, fluoranthene, fluorene, naphthalene, phenanthrene, and pyrene.
b. Leachate level monitoring was carried out monthly throughout 2021 in accordance with the Landfill ECA. Leachate level monitoring will continue to be completed monthly within the waste mound and LCS in 2022.

Groundwater Flow and Gradients

a. The 2021 groundwater flow directions in the shallow overburden unit were generally in a southerly direction with an average hydraulic gradient of 0.003 m/m in November 2021.
b. Review of the basal overburden/shallow bedrock levels indicate a relatively flat hydraulic gradient in the range of 0.0017 m/m.

Groundwater Quality

a. Groundwater data gathered in 2021 further confirms that natural background water quality within the on-Site shallow overburden unit is generally characterized by elevated levels of alkalinity, hardness, DOC, TDS, sulphate, and iron. The basal overburden/shallow bedrock unit is characterized by naturally elevated levels of sulphate, hardness, TDS, iron, and manganese.
b. The RUC and trigger level values for chloride were both exceeded in the groundwater quality of the shallow overburden unit at on-Site monitoring well OW8B-06 in June and November 2021. The proximity of this well to Brooks Road is interpreted to be the reason for these elevated chloride as road salt application on Brooks Road is a source.

c. The RUC and trigger level values for benzo(a)pyrene were both exceeded in the groundwater quality of the shallow overburden unit at on-Site monitoring well OW8B-06 in June 2021. Detectable PAHs at OW8B-06 are interpreted to be related to historic slag stockpiles in the vicinity of the Site and the use of road ballast along the Site entrance.

d. The trigger level value for boron was exceeded in the groundwater quality of the shallow overburden unit at on-Site monitoring well OW8B-06 in November 2021. In the absence of other significant indications of leachate-related groundwater quality impacts the boron trigger level exceedance are not interpreted to be related to the landfill.

e. There were no trigger level exceedances in groundwater samples collected from basal overburden/shallow bedrock monitoring wells during the current monitoring period.

f. There is no evidence of landfill related impacts to water quality in the basal overburden/shallow bedrock or deeper bedrock units.

Surface Water Quality

a. Water quality at background locations SW1, SW8, and SW9 indicated minor exceedances of several general chemistry and metals PWQOs. The background surface water monitoring results collected from SW1 and SW8 during 2021 were generally consistent with historical results. Results from SW9 are still variable and indicate elevated concentrations of alkalinity, hardness, and total dissolved solids. Additional sampling is required to understand water quality at SW9. VOC and PAH parameter concentrations were not detected above laboratory reporting limits at any background surface water monitoring location.

b. Water quality at SW6 has historically demonstrated some evidence of PAH and metals impacts. The source of these concentrations in the ditch at this location is not known but may be related to historic slag stockpiles and ballast used near the Site entrance. It is unlikely that leachate from the Site is the source of the concentrations identified.

c. Water quality at SW3 has historically been variable with elevated concentrations of hardness and boron observed during the 2021 monitoring period.

d. Based on the results of the 2021 surface water monitoring program, there is no direct evidence that landfilling-related activities are impacting water quality at the downstream surface water monitoring locations (SW4, SW5, SW6, SW7).

Landfill Gas

a. On-Site gas probes were monitored during the current monitoring period. Consistent with historical results, many gas probes were not operational due to flooding.

b. There were no detections of methane at the gas probes above 2.5% v/v. The highest concentration of combustible gas in 2021 was 0.7% v/v at GP5-19 in December. Methane was not detected at the other gas operational gas probes in 2021.

Industrial Sewage Works

a. An Annual Report of the leachate treatment system was prepared by CWI, with a summary copied as follows:

   i) Influent leachate samples were collected on a monthly and quarterly basis for respective required parameters.

   ii) The annual average treatment system flow rate was 41 m^3/day and the peak treatment system flow rate was 88 m^3/day. The peak daily flow rate is below the treatment system rated capacity of 200 m^3/day.

   iii) Operational problems were encountered and addressed.

   iv) Routine maintenance was conducted.

   v) There were no bi-passes or abnormal discharges during the reporting period.

   vi) No treated effluent was discharged to the roadside ditch from the LTS in 2021.

SWMS Pond

a. Monitoring of the SWMS Pond was carried-out in March, June, August, and November 2021.
b. Discharge of surface water from the SWMS Pond occurred during the reporting year.
c. Laboratory analyzed pH did not meet the trigger level on June 1, 2021, and the field measured pH did not meet the trigger level on November 12, 2021.
d. Confirmatory sampling of the pond was not conducted following the pH exceedances from the SWMS Pond on June 1, 2021 or November 12, 2021 and this represents a non-conformance with this condition of the ECA.
e. The remaining water quality results from the June and November samples do not suggest that there was any impact to water quality within the SWMP on these occasions. On the basis of the water quality, there is no evidence of a discharge of impacted water off-site, despite the pH results reported. As such the SWMS Pond is considered to be functioning properly.
f. The 2021 monitoring & reporting period operated under the Industrial Sewage ECA.

Summary of Site Operations and Development

During 2021 reporting period, the Site was actively receiving waste.

a. The 2021 quantity of waste disposed is estimated at 183,977 metric tonnes. The remaining Site life is calculated at approximately 2.78 and 0.89 years at varying waste densities.
b. The on-Site LTS treated 14,872 m3 of leachate and 19,409.71 m^3 of treated leachate/contact water was hauled off-Site for disposal in 2021.
c. The Site construction activities completed during the 2021 reporting period, consisted of the completion of interim cover in Stage 2, installation of interim cover over portions of Stage 3, visual fencing along the western berm and animal exclusionary and silt fence construction.
d. A total of two complaints were made in 2021. The complaints were related to odour. A complaint procedure is in place that includes a contact telephone number. A daily OMP was implemented by BRE. BRE has taken active operational measures to help reduce the potential for off-Site odours, including the use odour control granules.
e. Three e-updates were provided in place of PLC meetings were held in 2021.

Financial Assurance

In accordance with Condition 2 of the Landfill ECA, BRE has provided a total of $9,956,333 within an Environmental Protection Act Bond surety rider.

ECA Compliance

During the 2021 reporting period SWMS pond laboratory analysed pH did not meet the trigger level on June 1, 2021, and the field measured pH did not meet the trigger level on November 12, 2021. This represents a non-conformance with this condition of the ECA.

12. Recommendations

Based on the results of the 2021 Monitoring Program, the following recommendations are provided:

Environmental Monitoring

a. Implement the environmental monitoring program outlined in the amended Landfill ECA, and the Industrial Sewage Works ECA, as amended.
b. The surface seal at OW8B-06 should be inspected for integrity during 2022. The well may require repairs.
c. Assess blockage in MW1S-07 identified during the November 2021 monitoring and sampling event.

d. Consider repairing gas probes GP1-S and GP2-D so that monitoring can continue.

Stormwater Management

a. Carry out stormwater sampling from the SWMS in accordance with the Industrial Sewage ECA, as amended.

Leachate Management

a. Continue to remove leachate from the landfill through the operation of the on-Site LTS.
b. Continue to haul or dispose of treated effluent generated above the approved daily roadside ditch discharge rate to the Haldimand County WWTPs or otherwise as lawfully permitted.
c. Assess compliance with the annual leachate level requirements in accordance with Condition 5 of the Landfill ECA.
d. Carry out LTS sampling in accordance with the Industrial Sewage ECA in 2022.

Site Operations

a. Reduce potential for nuisance odours by:
    i. Continuing to conduct daily inspections and take steps to mitigate any odour identified at the property boundary.
    ii. Increase the amount of daily cover applied on the waste if odour is identified during daily inspections.
    iii. Minimize the active working face. Apply interim cover at a minimum thickness of 300 mm on areas of the landfill where landfilling has ceased for 6 months or more.
    iv. Limit exposed areas of the leachate collection system and control passive odour emissions from the east above ground leachate storage tank.
    v. When not in use, ensure blind flanges are placed on leachate collection system cleanouts and sump risers.
    vi. Use odour control granules as required to mitigate odour sources within the Site.
    vii. Lower the leachate level within the waste.
    viii. Follow the procedures within the Odour Management Plan.

All of Which is Respectfully Submitted,

Benjamin O. Kempel, P.Geo.

Brian Packer, B.Sc., P.Geo.

Ryan Loveday, P. Eng.

Notes:

[1] Groundwater levels will be measured at all monitoring wells during the May and November sampling events

[2] Surface water levels and flows will be measured during all surface water sampling events at all surface water locations

[3] List E - Trigger Parameter samples are collected and reviewed prior to discharging water from the SWMS Pond

Refer to Table 2 for the list of parameters

List A - indicator parameters (groundwater)

List B - inorganic chemistry, metals, PAHs, VOCs

List C - indicator parameters (surface water)

List D - TDS Pond Parameters

List E - Effluent Discharge Parameters

Table 4.1B

Environmental Monitoring Program
2021 List of Analytical Parameters
Brooks Road Landfill Site
Haldimand County, Ontario

List (s)	Analytical Group	Analytical Parameters
A	Indicator Parameters (groundwater)	alkalinity, ammonia, barium, boron, calcium, chloride, conductivity, iron, magnesium, nitrate, pH, sodium, TDS, sulphate, COD, DOC, turbidity
B	Inorganic Chemistry	alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulfate, DOC, TDS, suspended solids, phenol, BOD_5, COD, pH, total phosphorus, conductivity, turbidity
B	Metals	arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, nickel, potassium, calcium, aluminum
B	PAHs	naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(j)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene,
B	VOCs	chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, trans-1,2-dichloroethene, methyl-t-butyl ether, 1,1-dichloroethane, methyl ethyl ketone, cis-1,2-dichloroethene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane, trichloroethene, bromodichloromethane, cis-1,3-dichloropropene, methyl isobutyl ketone, trans-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m,p,o-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene
C	Indicator Parameters (surface water)	alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, pH, total phosphorus, TDS, suspended solids, sulphate, BOD5, COD, phenol, turbidity, temperature (field), and dissolved oxygen (field)
D	PSWMS Pond Parameters	General Chemistry: alkalinity, conductivity, hardness, pH, chloride, sulphate, nitrite, nitrate, ammonia, TSS, TDS, COD, total phosphorus, TKN, BOD_5, phenols Metals: arsenic, barium, boron, cadmium, chromium, copper, iron, lead, mercury, zinc Organics: ethylbenzene, naphthalene, benzo(a)pyrene Field Parameters: conductivity, dissolved oxygen, pH, temperature
E	PSWMS Pond Trigger Parameters	TSS, pH, un-ionized ammonia, iron, total phosphorus, zinc, boron, toluene, fluorene, napthalene Field Parameters: conductivity, dissolved oxygen, pH, temperature

Notes:

All units in meters above mean sea level (m AMSL)
(1) Surveyed on February 18, 2005
(2) Surveyed on May 1, 2001
(3) Surveyed on January 9, 2007
(4) Surveyed on June 13, 2007
(5) Surveyed on July 26, 2007
(6) Surveyed on March 31, 2010
(7) Surveyed on July 17, 2013
(8) Water level not considered reliable, monitoring well replaced
(9) Water level elevation obtained from others and considered unreliable
(10) Surveyed in February 2020
(11) Leachate well also measured by BRE on December 12, 2017
(12) Monitoring Wells MW5A-09 and MW5B-09 were accessed and measured on December 27, 2017
(13) surveyed on July 26, 2018
(14) surveyed on December 17, 2019
(15) risers adjusted in August 2019
NM Not Measured
NS Not Surveyed
DNA Data Note Available
* Groundwater elevation likely erroneous

Notes:

(1)	Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.
(2)	Water Management Policies, Guidelines, Provincial Water Quality Objectives, July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable ODWS/O. Reg 153/04 criteria.
< 0.10	Method detection limit does not meet ODWS/O. Reg 153/04 criteria.
< 0.20	Result below method detection limit.

Notes:

(1)	Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable ODWS/O. Reg 153/04 criteria.
< 0.10	Method detection limit does not meet ODWS/O. Reg 153/04 criteria.
< 0.20	Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable ODWS/O. Reg 153/04 criteria.

< 0.10 Method detection limit does not meet ODWS/O. Reg 153/04 criteria.

< 0.20 Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable ODWS/O. Reg 153/04 criteria.

< 0.10 Method detection limit does not meet ODWS/O. Reg 153/04 criteria.

< 0.20 Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

(2) Table 2 of the Soil, Groundwater and Sediment Standards for Use under Part XV.I of the Environmental Protection Act, dated April 15, 2011.

\- No Value/Not Analyzed.

J The result is an estimated value.

0.054 Does not meet the applicable criteria.

< 0.10 Method detection limit does not meet criteria.

< 0.20 Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable ODWS/O. Reg 153/04 criteria.

< 0.10 Method detection limit does not meet ODWS/O. Reg 153/04 criteria.

< 0.20 Result below method detection limit.

Notes:

(1)	Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable ODWS/O. Reg 153/04 criteria.
< 0.10	Method detection limit does not meet ODWS/O. Reg 153/04 criteria.
< 0.20	Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable ODWS/O. Reg 153/04 criteria.

< 0.10 Method detection limit does not meet ODWS/O. Reg 153/04 criteria.

< 0.20 Result below method detection limit.

Notes:

(1)	Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable ODWS/O. Reg 153/04 criteria.
< 0.10	Method detection limit does not meet ODWS/O. Reg 153/04 criteria.
< 0.20	Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

(2) Table 2 of the Soil, Groundwater and Sediment Standards for Use under Part XV.I of the Environmental Protection Act, dated April 15, 2011.

\- No Value/Not Analyzed.

J The result is an estimated value.

0.054 Does not meet the applicable criteria.

< 0.10 Method detection limit does not meet criteria.

< 0.20 Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

(2) Table 2 of the Soil, Groundwater and Sediment Standards for Use under Part XV.I of the Environmental Protection Act, dated April 15, 2011.

\- No Value/Not Analyzed.

J The result is an estimated value.

0.054 Does not meet the applicable criteria.

< 0.10 Method detection limit does not meet criteria.

< 0.20 Result below method detection limit.

Notes:

(1)	Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable ODWS/O. Reg 153/04 criteria.
< 0.10	Method detection limit does not meet ODWS/O. Reg 153/04 criteria.
< 0.20	Result below method detection limit.

Notes:

(1) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, prepared by the MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable ODWS/O. Reg 153/04 criteria.

< 0.10 Method detection limit does not meet ODWS/O. Reg 153/04 criteria.

< 0.20 Result below method detection limit.

Sample Key - Surface Water Monitoring
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Notes:

[1]	- Beginning on May 9, 2005, SW-1 was sampled from a new location because the approved SW-1 was historically dry.
[1]	Confirmatory sampling occurs following a SWMS Pond sample result detected above the relative trigger level.
NS	Not Sampled
Dry	Location was dry at time of sampling
Indicator Parameters	Alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, total phosphorus, TDS, pH, suspended solids, sulphate, BOD_5, COD, phenols, temperature, and dissolved oxygen.
Inorganic Chemistry	Alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulphate, DOC, TDS, suspended solids, phenol, BOD_5, COD, pH, total phosphorus, potassium, conductivity, and calcium.
Metals	Arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, and nickel.
VOCs	Volatile Organic Compounds
PAHs	Polycyclic Aromatic Hydrocarbons
SWMS Pond Parameter List	Alkalinity, conductivity, hardness, pH, chloride, sulphates, nitrate, nitrite, ammonia, TSS, TDS, COD, total phosphorus, TKN, BOD_5, phenolics, dissolved oxygen, temperature, arsenic, barium, boron, cadmium, calcium chromium, copper, iron, lead, magnesium, mercury, zinc, ethylbenzene, benzo(a)pyrene, fluorene, and napthalene.
Leachate Monitoring (LCS Industrial Sewage Works ECA)	Alkalinity, conductivity, hardness, pH, chloride, sulphates, nitrate, nitrite, ammonia, TSS, TDS, COD, total phosphorus, TKN, BOD_5, DOC, phenols, dissolved oxygen, temperature, arsenic, barium, boron, cadmium, chromium, copper, iron, lead, mercury, zinc, benzo(a)pyrene, ethylbenzene, napthalene, benzene, toluene, 1,4-dichlorobenzene, dichloromethane, and vinyl chloride
Quarterly Parameters	Alkalinity, conductivity, hardness, pH, chloride, sulphates, nitrate, nitrite, ammonia, TSS, TDS, COD, total phosphorus, TKN, BOD_5, phenols, dissolved oxygen, temperature, arsenic, barium, boron, cadmium, chromium, copper, iron, lead, mercury, zinc, ethylbenzene, napthalene, and benzo(a)pyrene.
Trigger Parameters	pH, TSS, un-ionized ammonia, iron, total phosphorus, zinc, boron, ethylbenzene, benzo(a)pyrene, and napthalene.
Indicator Parameters	Alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, total phosphorus, TDS, pH, suspended solids, sulphate, BOD_5, COD, phenols, temperature, and dissolved oxygen.
Comprehensive List	Alkalinity, ammonia, arsenic, barium, benzo(a)pyrene, boron, cadmium, chloride, chromium, conductivity, copper, ethylbenzene, iron, lead, mercury, napthalene, nitrate, nitrite, TKN, total phosphorus, TDS, pH, suspended solids, sulphate, BOD_5, COD, phenol, temperature, and dissolved oxygen.

Notes:

(1)	Water Management Policies, Guidelines, Provincial Water Quality Objectives,July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable PWQO criteria.
< 0.10	Method detection limit does not meet PWQO criteria.
< 0.20	Result below method detection limit.

Notes:

(1) Water Management Policies, Guidelines, Provincial Water Quality Objectives,July 1994 (reprinted February 1999), prepared by MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable PWQO criteria.

< 0.10 Method detection limit does not meet PWQO criteria.

< 0.20 Result below method detection limit.

Notes:

(1)	Water Management Policies, Guidelines, Provincial Water Quality Objectives,July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable PWQO criteria.
< 0.10	Method detection limit does not meet PWQO criteria.
< 0.20	Result below method detection limit.

Notes:

(1) Water Management Policies, Guidelines, Provincial Water Quality Objectives,July 1994 (reprinted February 1999), prepared by MOECC.

\- No Value/Not Analyzed.

J The result is an estimated value.

R Rejected.

0.054 Does not meet the applicable PWQO criteria.

< 0.10 Method detection limit does not meet PWQO criteria.

< 0.20 Result below method detection limit.

Notes:

(1)	Water Management Policies, Guidelines, Provincial Water Quality Objectives,July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable PWQO criteria.
< 0.10	Method detection limit does not meet PWQO criteria.
< 0.20	Result below method detection limit.

Notes:
All units in ug/L.

(1) Water Management Policies, Guidelines, Provincial Water Quality Objectives, July 1994 (reprinted February 1999), prepared by MOECC.
- No Value/Not Analyzed.
J The result is an estimated value.
R Rejected.
0.054 Does not meet the applicable PWQO criteria.
< 0.10 Method detection limit does not meet PWQO criteria.
< 0.20 Result below method detection limit.

Notes:
All units in ug/L.

(1)	Water Management Policies, Guidelines, Provincial Water Quality Objectives, July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable PWQO criteria.
< 0.10	Method detection limit does not meet PWQO criteria.
< 0.20	Result below method detection limit.

Notes:
All units in ug/L.

(1)	Water Management Policies, Guidelines, Provincial Water Quality Objectives, July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
R	Rejected.
0.054	Does not meet the applicable PWQO criteria.
< 0.10	Method detection limit does not meet PWQO criteria.
< 0.20	Result below method detection limit.

Notes:
All units in ug/L.

(1) Water Management Policies, Guidelines, Provincial Water Quality Objectives, July 1994 (reprinted February 1999), prepared by MOECC.
- No Value/Not Analyzed.
J The result is an estimated value.
R Rejected.
0.054 Does not meet the applicable PWQO criteria.
< 0.10 Method detection limit does not meet PWQO criteria.
< 0.20 Result below method detection limit.

Toluene	0.00	41	NHR	60	NV	0.7	30	25.5

Notes:

(1) General chemistry and metals results are expressed in mg/L and PAH and VOC results are expressed in µg/L.
(2) Average median background concentrations are based on groundwater quality reported at wells MW1B-01, MW1B-07, MW1B-13, OW3B-85, OW3B-07, OW3B-13, OW9B-92, and OW9B-06 between 2004 and 2020.
(3) Highest reported concentration in current landfill leachate between (2010 and 2020).
(4) Where a parameter was analyzed for but was not detected at or above the Method Detection Limit, a value of 1/2 of the lowest MDL was assumed.
(5) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, as amended, prepared by the MECP. Where no ODWS criteria exists, the RUC values were developed using Table 2 of the Soil, Groundwater and Sediment Standards for Use Under Part XV.I of the Environmental Protection Act, dated April 15, 2011.
(6) A value of zero was used to calculate the RUC for PAHs and VOCs, as recommended by the MECP.
NV No value.
HR Health Related Parameters.
NHR Non Health Related Parameters.
RUC Reasonable Use Criteria.
RUC for NHR Parameters = (ODWS - Average Background Level) x 0.5 + Average Background Level.
RUC for HR Parameters = (ODWS - Average Background Level) x 0.25 + Average Background Level.
Concentration exceeds ODWS and RUC.

Notes:

(1)	General chemistry and metals results are expressed in mg/L and PAH and VOC results are expressed in µg/L.
<0.001	The parameter was analyzed for but not detected at or above the method detection limit. The associated value is the method detection limit.
RUC	Reasonable Use Criteria.
	Concentration exceeds RUC.
--	Not analyzed
41.4/44.1	Duplicate samples were submitted for analysis.
U	The analyte was analyzed for but not detected above the reported sample quantitation limit.
NS	Not sampled
< 0.10	Method detection limit does not meet criteria.

Table 9.1

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
1. GENERAL		
Compliance		
(1) This Approval revokes all previous Approvals and Notices of Amendment issued under Part V of the Environmental Protection Act for this Site. The approval given herein, including the terms and conditions set out, replaces all previously issued Approvals and related terms and conditions under Part V of the Act for this Site.	Acknowledged	
(2) The Owner and Operator shall ensure compliance with all the conditions of this Approval and shall ensure that any person authorized to carry out work on or operate any aspect of the Site is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.	Acknowledged	
(3) Any person authorized to carry out work on or operate any aspect of the Site shall comply with the conditions of this Approval.	Acknowledged	
In Accordance		
(4) Except as otherwise provided by this Approval, the Site shall be designed, developed, built, operated and maintained in accordance with the documentation listed in the attached Schedule "A".	Acknowledged	
(5) 1. Construction and installation of aspects described in Schedule "A" must be completed within 5 years of the later of:		
(a) the date this Approval is issued; or	Complete	
(b) if there is a hearing or other litigation in respect of the issuance of this Approval, the date that this hearing or litigation is disposed of, including all appeals.		
2. This Approval ceases to apply in respect of the aspects of the Site noted above that have not been constructed or installed before the later of the dates identified in Condition 1(5)1.		
Interpretation		
(6) Where there is a conflict between a provision of any document listed in Schedule "A" in this Approval, and the conditions of this Approval, the conditions in this Approval shall take precedence.	Acknowledged	
(7) Where there is a conflict between the application and a provision in any document listed in Schedule A, the application shall take precedence, unless it is clear that the purpose of the document was to amend the application and the Ministry approved the amendment.	Acknowledged	
(8) Where there is a conflict between any two documents listed in Schedule "A", the document bearing the most recent date shall take precedence.	Acknowledged	
(9) The conditions of this Approval are severable. If any condition of this Approval, or the application of any condition of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.	Acknowledged	
Other Legal Obligations		
(10) The issuance of, and compliance with, this Approval does not:		
(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement; and	Acknowledged	
(b) limit in any way the authority of the Ministry to require certain steps be taken or to require the Owner and Operator to furnish any further information related to compliance with this Approval.		
Adverse Effect		
(11) The Owner and Operator shall take steps to minimize and ameliorate any adverse effect on the natural environment or impairment of water quality resulting from the present, past and historical operations at the Site. Such steps may include accelerated or additional monitoring as may be necessary to determine the nature and extent of the effect or impairment.	Acknowledged	
(12) Despite an Owner, Operator, or any other person fulfilling any obligations imposed by this Approval, the person remains responsible for any contravention of any other condition of this Approval or any applicable statute, regulation, or other legal requirement resulting from any act or omission that caused the adverse effect to the natural environment or impairment of water quality.	Acknowledged	
(13) At no time shall the Owner or Operator allow the discharge of a contaminant that causes or is likely to cause an adverse effect.	Acknowledged	
Change of Ownership		
(14) The Owner shall notify the Director, in writing, and forward a copy of the notification to the District Manager, within 30 days of the occurrence of any changes in the following information:		
(a) the ownership of the Site;		
(b) the Operator of the Site;	Acknowledged	
(c) the address of the Owner or Operator; and		
(d) the partners, where the Owner or Operator is or at any time becomes a partnership and a copy of the most recent declaration filed under the Business Names Act, R. S. O. 1990, c. B.17, shall be included in the notification.		
(15) No portion of this Site shall be transferred or encumbered prior to or after closing of the Site unless the Director is notified in advance and sufficient financial assurance is deposited with the Ministry to ensure that these conditions will be carried out.	Acknowledged	
(16) In the event of any change in ownership of the Site, other than change to a successor municipality, the Owner shall notify the successor of and provide the successor with a copy of this Approval, and the Owner shall provide a copy of the notification to the District Manager and the Director.	Acknowledged	
Registration on Title Requirement		
(17) Prior to dealing with the property in any way, the Owner shall provide a copy of this Approval and any amendments, to any person who acquires an interest in the property as a result of the dealing.	Acknowledged	
(18) (a) If not already completed, within ninety (90) calendar days from the date of issuance of this Approval, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:		
(i) a plan of survey prepared, signed and sealed by an Ontario Land Surveyor, which shows the area of the Site where waste has been and is to be deposited at the Site;		
(ii) proof of ownership of the Site;		A letter addressed to Taylor Buck of the MECP, dated January 8, 2021, requested concurrence on an updated Certificate of Requirement to be filed as an update to the Certificate of Requirement already on title.
(iii) a letter signed by a member of the Law Society of Upper Canada or other qualified legal practitioner acceptable to the Director, verifying the legal description provided in the Certificate of Requirement;		
(iv) the legal abstract of the property; and	Acknowledged	
(v) any supporting documents including a registerable description of the Site.		
(b) If not already completed, within fifteen (15) calendar days of receiving a Certificate of Requirement authorized by the Director, the Owner shall:		
(i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and		
(ii) submit to the Director and the District Manager, written verification that the Certificate of Requirement has been registered on title.		

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
Registration on Title Requirement - Contaminant Attenuation Zone (CAZ)		
(19) Within thirty (30) calendar days from the date of establishing a contaminant attenuation zone (CAZ) (overburden and/or bedrock aquifers) in either fee simple or by way of a groundwater easement, the Owner shall submit to the Director a completed Certificate of Requirement which shall include: (a) If rights are obtained in fee simple, the Owner shall provide: (i) documentation evidencing ownership of the CAZ obtained in compliance with Regulation 232, as amended; (ii) a completed Certificate of Requirement and supporting documents containing a registerable description of the CAZ; and (iii) a letter signed by a member of the Law Society of Upper Canada; or other qualified legal practitioner acceptable to the Director, verifying the legal description of the CAZ. (b) within fifteen (15) calendar days of receiving a Certificate of Requirement signed or authorized by the Director,the Owner shall: (i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and (ii) submit to the Director and the District Manager, a written verification that the Certificate of Requirement has been registered on title. (c) If rights are obtained by way of a groundwater easement, the Applicant shall: (i) provide a copy of the agreement for the easement; (ii) provide a plan of survey signed and sealed by an Ontario Land Surveyor for the CAZ; and (iii) submit proof of registration on title of the groundwater easement to the Director and District Manager; (d) The Owner shall not amend, or remove, or consent to the removal of the easement or CAZ from title without the prior written consent of the Director.	Acknowledged	
Inspections by the Ministry		
(20) No person shall hinder or obstruct a Provincial Officer from carrying out any and all inspections authorized by the OWRA, the EPA, the PA, the SDWA or the NMA, of any place to which this Approval relates, and without limiting the foregoing: (a) to enter upon the premises where the approved works are located, or the location where the records required by the conditions of this Approval are kept; (b) to have access to, inspect, and copy any records required to be kept by the conditions of this Approval; (c) to inspect the Site, related equipment and appurtenances; (d) to inspect the practices, procedures, or operations required by the conditions of this Approval; and (e) to sample and monitor for the purposes of assessing compliance with the terms and conditions of this Approval or the EPA, the OWRA, the PA, the SDWA or the NMA.	Acknowledged	
Information and Record Retention		
(21) (a) Except as authorized in writing by the Director, all records required by this Approval shall be retained at the Site for a minimum of two (2) years from their date of creation. (b) The Owner shall retain all documentation listed in Schedule "A" for as long as this Approval is valid. (c) All information and logs required in Conditions 9(1), 10(1), 11(3), 11(4), 12(3), and 12(4) shall be kept at the Site until they are included in the Annual Report. (d) The Owner shall retain employee training records as long as the employee is working at the Site. (e) The Owner shall make all of the above documents available for inspection upon request of Ministry staff.	Acknowledged	
(22) The receipt of any information by the Ministry or the failure of the Ministry to prosecute any person or to require any person to take any action under this Approval or under any statute, regulation or other legal requirement, in relation to the information, shall not be construed as: (a) an approval, waiver, or justification by the Ministry of any act or omission of any person that contravenes any term or condition of this Approval or any statute, regulation or other legal requirement; or (b) acceptance by the Ministry of the information's completeness or accuracy.	Acknowledged	
(23) The Owner shall ensure that a copy of this Approval, in its entirety and including all its Notices of Amendment, and documentation listed in Schedule "A", are retained at the Site at all times.	Acknowledged	
(24) Any information related to this Approval and contained in Ministry files may be made available to the public in accordance with the provisions of the Freedom of Information and Protection of Privacy Act, RSO 1990, CF-31.	Acknowledged	
2. FINANCIAL ASSURANCE		
(1) (a) Within twenty (20) days of issuance of this Notice, the Owner shall submit to the Director, Financial Assurance as defined in Section 131 of the Environmental Protection Act, in the amount of $8,371,282.00. This Financial Assurance shall provide sufficient funds for the closure and post-closure care/monitoring of the Site. (i) The total amount of financial assurance specified in Condition 2(1)(a) shall be updated by the Owner, as follows, by the specified dates: i. October 1, 2021 - $9,956,333.00 ii. October 1, 2022 - $11,541,383.00 iii. October 1, 2023 - $10,424,285.00 iv. October 1, 2024 - $10,097,075.00	Acknowledged	Amount required for 2021 has been provided.
(b) Commencing on October 1, 2023 and on a three (3) year basis thereafter, the Owner shall provide to the Director a re-evaluation of the amount of the Financial Assurance to facilitate the actions required under Condition 2(1)(a). The re-evaluation shall include an assessment based on any new information relating to the environmental conditions of the Site and shall include the costs of additional monitoring and/or implementation of alternative measures required by the Director upon review of the annual reports. The Financial Assurance must be submitted to the Director within twenty (20) days of written acceptance of the re-evaluation by the Director; (c) The amount of Financial Assurance is subject to review at any time by the Director and may be amended at his/her discretion. If any Financial Assurance is scheduled to expire or notice is received, Indicating Financial Assurance will not be renewed, and satisfactory methods have not been made to replace the Financial Assurance at least sixty (60) days before the Financial Assurance terminates, the Owner shall forthwith replace the Financial Assurance with cash.		
3. SITE OPERATION		
Operation		
(1) The Site shall be operated and maintained at all times including management and disposal of all waste, in accordance with the EPA, Regulation 347, Regulation 232, and the conditions of this Approval.	Acknowledged	
Service Area		
(2) Waste categories of Industrial, Commercial and Institutional ("ICI waste"), generated from within the geographic boundaries of the Province of Ontario may be received for disposal at this Site.	Acknowledged	
Waste Types		
(3) Only solid non-hazardous ICI waste, including contaminated soils, and processed organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant), shall be received for disposal at this Site. No hazardous waste or liquid industrial waste, as defined in Reg. 347, as amended by Reg. 558/00, shall be disposed at this Site.	Acknowledged	
(4) The Owner shall develop and implement a program to inspect waste to ensure that the waste received at the Site is of a type approved for acceptance under this Approval.	Acknowledged	
(5) The Owner shall ensure that all loads of waste are properly inspected by Trained Personnel prior to acceptance at the Site and that the waste vehicles are directed to the appropriate areas for disposal or transfer of the waste. The Owner shall notify the District Manager, in writing, of load rejections at the Site within one (1) business day from their occurrence.	Acknowledged	

Table 9.1

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
Approved Waste Quantities		
(6) The maximum volumetric capacity for the Site including waste and daily cover shall not exceed 1,045,065 cubic metres.	Acknowledged	
(7) The Owner shall ensure that the waste received at the Site does not exceed:		
(a) a total of 151,000 tonnes in any calendar year; and	Acknowledged	
(b) the daily maximum received at the site does not exceed 1,000 tonnes.		
Waste Placement		
(8) No waste shall be landfilled outside of the approved six (6) hectare footprint fill area. The site shall be developed, maintain established buffer areas, and adhere to final contours for waste and final cover material in accordance with the design drawings provided in Appendix L of the Design and Operations Report.	Acknowledged	
(a) The maximum elevation of the fill zone, including final cover, shall be 221.50 metres above mean sea level.		
Signage		
(9) A sign shall be installed and maintained at the main entrance/exit to the Site on which is legibly displayed the following information:		
(a) the name of the Site and Owner;		
(b) the number of the Approval;		
(c) the name of the Operator;		
(d) the normal hours of operation;	Complete	
(e) the allowable and prohibited waste types;		
(f) the telephone number to which complaints may be directed;		
(g) a warning against unauthorized access;		
(h) a twenty-four (24) hour emergency telephone number (if different from above); and		
(i) a warning against dumping outside the Site.		
(10) All landfill signs shall be kept legible, in good repair, and cleaned when required.	Acknowledged	
Nuisance Control (Vermin, Vectors, Dust, Litter, Odour, Noise and Traffic)		
(11) The Site shall be operated and maintained such that vermin, vectors, dust, litter, odour, noise and traffic do not create a nuisance.	Acknowledged	
(12) The Owner/Operator shall install visual screening berms, in accordance with the Design and Operations Report and shall inspect and maintain them as required, during the operating life of the landfill Site.	Acknowledged	Installation of visual screening fence along west berm completed in 2021
(13) The Owner/Operator shall conduct inspections and ensure that appropriate controls are in place to prevent the acceptance of liquid industrial waste and hazardous waste and to prevent the acceptance of waste from outside the approved service area. Records of violations by haulers or waste generators shall be maintained in the daily records for the Site operations. The Owner/Operator shall ensure that any waste refused for disposal leaves the Site immediately, and the District Manager is notified forthwith, of all waste load refusals at the Site related to requirements in this Certificate, including service area and waste types.	Acknowledged	
(14) The Owner/Operator shall ensure that the leachate collection system piping in the fill area and the connecting forcemain piping which leads to the leachate holding tank, shall be cleaned out at least once per year with a high pressure wash, and video inspections conducted, as necessary, to confirm that the pipes are clean and to determine the need for more frequent cleaning. Assessment of the need to amend the cleaning frequency shall be based on regular inspections of the leachate collection system and monitoring results.	Acknowledged	
(15) A thickness of at least 5 metres of compacted waste and cover material shall be maintained between any landfilled sludge (solid non-hazardous as per Reg. 347) and the granular leachate collection layer and leachate monitoring wells.	Acknowledged	
(16) The Owner/Operator shall take all reasonable steps to prevent off-site nuisance impacts, including visual impacts, transfer of waste, mud, or dust from the Site onto public roads due to landfill operations.	Acknowledged	
Burning of Waste		
(17) Burning of waste at the Site is prohibited.	Acknowledged	
Scavenging		
(18) Scavenging (as defined in Reg. 347) of deposited and/or stockpiled waste is prohibited at the Site. Controlled removal of recycleable/reusable material from the Site may only occur in a designated paved area on the Site, and shall be supervised by Trained Personnel.	Acknowledged	
Hours of Operation		
(19) The permitted hours of operation for the site are from 6:00 a.m. to 6:00 p.m., Monday to Friday, and from 6:00 a.m. to 2:00 p.m. on Saturdays, for site preparation, site maintenance and daily cover activities. The operating hours for receipt of waste for disposal at the Site shall be from 7:00 a.m. to 5:00 p.m., Monday to Friday, and from 7:00 a.m. to 1:00 p.m., on Saturdays. No operations shall take place at the Site outside of the stated hours and the Site shall be closed on statutory holidays.	Acknowledged	
(20) The hours of operation may be amended from time to time to accommodate seasonal or unusual demand, based on prior consultation with the PLC and written concurrence from the District Manager.	Acknowledged	
Site Security		
(21) No waste shall be received, landfilled or removed from the Site unless a site supervisor or other Trained Personnel are present to supervise the operations during operating hours. The Site shall be closed when a supervisor or Trained Personnel are not present to supervise operations at the Site.	Acknowledged	
(22) The Site shall be operated and maintained in a safe and secure manner. During non-operating hours, the Site entrance and exit gates shall be locked and the Site shall be secured against access by unauthorized persons.	Acknowledged	
Cover Material		
(23) Alternative materials to soil may be used as weekly and interim cover material, based on an application with supporting information and applicable fee for a trial use or permanent use, submitted by the Owner to the Director, copied to the District Manager and as approved by the Director via an amendment to this Approval. The alternative material shall be non-hazardous according to Regulation 347 and will be expected to perform at least as well as soil in relation to the following functions:		
(a) control of blowing litter, odours, dust, landfill gas, gulls, vectors, vermin and fires;	Acknowledged	
(b) provision for an aesthetic condition of the landfill during the active life of the Site;		
(c) provision for vehicle access to the active tipping face; and		
(d) compatibility with the design of the Site for groundwater protection, leachate management and landfill gas management.		
(24) Daily, interim and final cover material shall be shall be applied as follows:		
a. Daily Cover - At the end of each working day, the entire working face shall be compacted and covered with a minimum thickness of 150 mm of soil cover, compost, wood chips, or other approved daily cover material. Prior to placing waste at the start of the next operating day, the existing daily cover material shall be scarified or removed to the extent practical, to ensure vertical hydraulic connection is maintained between layers of waste and to promote percolation of leachate downwards to the leachate collection system.		
b. Interim Cover - In areas where landfilling ceases temporarily for a period of 6 months or more, a minimum thickness of 300 mm of soil shall be placed as interim cover and graded to promote surface water runoff. The quality of soil for use as interim cover shall, as a minimum, meet the standards specified in Table 3 of Soil, Groundwater and Sediment Standards for use under Part XV.1 of the Environmental Protection Act. Prior to the use of interim cover soil, representative samples shall be taken and analysed for metals, Volatile Organic Compounds (VOCs) and PAHs, to confirm the soil meets the above-mentioned standards.	Acknowledged	
c. Final Cover - Final cover shall be applied progressively as areas of the landfill reach final waste elevations within the fill area. Prior to placement of final cover, the Owner/Operator shall submit for the approval of the Director, a report detailing the specifications, including particle size distribution of the final cover soil which shall confirm the designed infiltration rate of 0.15 m/year, as well as the protocols for testing and acceptance for on-site and off-site final cover soils. All areas of final cover shall be graded and vegetated as soon as practically possible. The final soil cap shall be regularly inspected and maintained after the installation and during the post-closure period. Without limiting the above, the Owner/Operator shall ensure for a minimum of five years after completion of the cap that the Site shall be inspected at least on a quarterly basis to ensure that there is positive drainage along the cap and that during the frost free period of the first two years following completion, such inspections shall be monthly. If any inspection indicates that there is an area of ponding or zero slope, the Owner/Operator shall take all steps necessary to provide positive drainage and rehabilitate the final cover as soon as practically possible.		
d. All on-site and excess soil used for daily, interim, and final cover shall be managed in accordance with Regulation 406.		
Traffic Control		
(25) The Owner/Operator shall ensure that vehicles carrying waste or materials to and from the Site shall only enter the Site from Highway #3 and Brooks Road. At no time shall any vehicle carrying waste or materials to and from the Site travel along Townline Road to access the Site.	Acknowledged	
(26) The Owner/Operator shall be responsible for maintenance and remedial work to the Improvement Area.		
The Improvement Area shall be maintained to the following minimum requirements:		
(a) 300 mm thick granular "A" layer of gravel, meeting all applicable Haldimand County and Ontario Provincial Standards Specification (OPSS) to the Improvement Area; and	Acknowledged	Completion of the improvement area is planned for 2022
(b) Maintain asphalt on the entranceway/exit to the landfill and the parking area for the landfill Site, as well as 30 metres of the road approach on Brooks Road to the entranceway/exit to the Site, extending both north and south of the entranceway/exit, in base asphalt and top coat. The thickness of asphalt shall be a base coarse of 60 mm (HL8), and a surface coarse of 50 mm (HL3).		
Odour Management		
(27) Within ninety (90) days from the issuance of this Approval, the Owner shall submit to the District Manager for approval, an Odour Management Plan that includes mitigation measures to minimize off-Site odour impacts, and if appropriate, a trigger mechanism and contingency plan.	Complete	
(28) The Odour Management Plan shall be reviewed on an annual basis as part of the Annual Report.	Acknowledged	

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
(29) If there is any odour complaint, or significant odour is detected during daily inspection, and the odour is confirmed to originate from the Site, mitigation measures shall be implemented immediately in accordance with the Odour Management Plan approved by the District Manager.	Acknowledged	
(30) If odour causes adverse off-site impacts that are not mitigated through implementation of odour mitigation measures according to the Odour Management Plan, the Owner shall, upon written notification from the District Manager, conduct an investigation into the cause as to why the impacts were not mitigated and submit to the District Manager within the time frame identified in the notice, an assessment of the issues and the need for implementation of contingency actions in accordance with the Odour Management Plan.	Acknowledged	
(31) If the Ministry deems the odour mitigation measures taken as per Condition 3(29) to be unsuitable, insufficient or ineffective, the District Manager may direct the Owner, in writing, to propose further measures to address the noted failure, upset or malfunction, which may include requiring a reduction in the receipt of waste, cessation of the receipt of waste, removal and disposal of waste from the waste diversion area, the removal of leachate from the Site in accordance with Condition 5(5), as well as, making repairs or modifications to equipment or processes. Such measures shall be implemented by the Owner upon approval by the District Manager.	Acknowledged	
(32) If the cessation of the receipt of waste is required, as determined by Condition 3(31), no waste shall be received at the Site until the District Manager is satisfied that odour impacts have been adequately mitigated.	Acknowledged	
4. GROUNDWATER AND SURFACE WATER MONITORING		
Compliance		
(1) The Site shall be operated in such a way as to ensure compliance with the following: (a) Reasonable Use Guideline B-7 for the protection of the groundwater at the Site; and (b) Provincial Water Quality Objectives included in the July 1994 publication entitled Water Management Policies, Guidelines, Provincial Water Quality Objectives, as amended from time to time, or limits set by the Regional Director, or the Canadian Water Quality Guidelines published by the Canadian Council of Ministers of the Environment, 1999 for the protection of the surface water at and off the Site.	Acknowledged	
Surface Water and Groundwater		
(2) The Owner shall monitor surface water and groundwater in accordance with the environmental monitoring program outlined in Schedule "B".	Acknowledged	
(3) A certified Professional Geoscientist or Engineer possessing appropriate hydrogeologic and hydrologic training and experience shall execute or directly supervise the execution of the environmental monitoring and reporting program.	Acknowledged	
Groundwater Wells and Monitors		
(4) The Owner shall ensure that all groundwater monitoring wells which form part of the monitoring program are properly capped, locked and protected from damage and maintained in accordance with Regulation 903.	Acknowledged	
(5) Where landfilling is to proceed around monitoring wells, suitable extensions shall be added to the wells and the wells shall be properly re-secured.	Acknowledged	
(6) Any groundwater monitoring well included in the on-going monitoring program that is damaged shall be assessed, repaired, replaced or decommissioned by the Owner, as required.		
(a) The Owner shall repair or replace any monitoring well which is destroyed or in any way made to be inoperable for sampling such that no more than one regular sampling event is missed. (b) All monitoring wells which are no longer required as part of the groundwater monitoring program, and have been approved by the Director or the District Manager for abandonment, shall be decommissioned by the Owner, as required, in accordance with Regulation 903, to prevent contamination through the abandoned well. A report on the decommissioning of the well shall be included in the Annual Report for the period during which the well was decommissioned.	Acknowledged	Integrity of OW8B06 and Blockage at MW1S-07 will be assessed prior to the May 2022 sampling event.

Table 9.1

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
Trigger Mechanisms and Contingency Plans		
(7) In the event of a confirmed exceedance of a site-specific trigger level relating to groundwater or surface water impacts due to leachate, the Owner shall immediately notify the District Manager, and an investigation into the cause and the need for implementation of remedial or contingency actions shall be carried out by the Owner in accordance with the approved trigger mechanisms and associated contingency plans provided in Appendix J of the Design and Operations Report.	Acknowledged	
(8) If monitoring results, investigative activities and/or trigger mechanisms indicate the need to implement contingency measures, the Owner shall ensure that the following steps are taken: (a) the Owner shall notify the District Manager, in writing of the need to implement contingency measures, no later than seven (7) days after confirmation of the exceedances; (b) within thirty (30) days from the date of confirming the need to implement contingency measures, detailed plans, specifications and descriptions for the design, operation and maintenance of the contingency measures shall be prepared and submitted by the Owner to the Director for approval; and (c) the contingency measures shall be implemented by the Owner upon approval by the Director.	Acknowledged	
(9) The Owner shall ensure that any proposed changes to the site-specific trigger levels for leachate impacts to surface water or groundwater, are approved in advance by the Director via an amendment to this Approval.	Acknowledged	
Changes to the Monitoring Plan, Trigger Mechanism and Contingency Plan		
(10) The Owner may request to make changes to the environmental monitoring program, Trigger Mechanism and Contingency Plan to the District Manager in accordance with the recommendations of the annual report. The Owner shall make clear reference to the proposed changes in a separate letter that shall accompany the annual report.	Acknowledged	
(11) Within fourteen (14) days of receiving the written correspondence from the District Manager confirming that the District Manager is in agreement with the proposed changes to the environmental monitoring program, the Owner shall forward a letter identifying the proposed changes and a copy of the correspondences from the District Manager and all other correspondences and responses related to the changes to the monitoring program, to the Director requesting the Approval be amended to approve the proposed changes to the environmental monitoring plan prior to implementation.	Acknowledged	
(12) In the event any other changes to the environmental monitoring program are proposed outside of the recommendation of the annual report, the Owner shall follow current Ministry procedures for seeking approval for amending the Approval.	Acknowledged	
5. LEACHATE MANAGEMENT AND DISPOSAL		
(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site Leachate Treatment System, in accordance with the terms and conditions of the Industrial Sewage Works Approval No. 1122-BKUPSM dated February 3, 2020, as amended. (a) Notwithstanding Condition 5(1), leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.	Acknowledged	
(2) Leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall not be discharged to the natural environment at any time.	Acknowledged	
(3) Any alternative proposal for leachate management and disposal must receive prior written approval of the District Manager.	Acknowledged	
(4) The Owner shall reduce the level of leachate within the landfill to an elevation 191 metres above mean sea level (AMSL), which equates to an average leachate depth of no greater than 0.3 metres, by the earlier of: (a) five (5) years from the issuance date of this ECA; or (b) the date the landfill reaches capacity.	Acknowledged	
(5) In addition to the requirements of Condition 5(4), the interim annual leachate elevation levels and interim landfill capacity-based leachate elevations shall be adhered to pursuant to Schedules "C" and "D" respectively. (a) The leachate elevation, as determined by the pressure transducer located in the leachate collection sump riser pipe shall be used to establish the landfill leachate elevation. The leachate elevation will be considered in compliance with the target leachate elevations if the measurement meets the elevations stated in Schedules "C" and "D" within fifteen (15) days of the compliance date.	Acknowledged	
(6) The Owner shall implement the leachate management contingency measures in the report titled "Leachate Removal Plan, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited", prepared February 7, 2020, as amended, as necessary to meet the leachate elevations in Schedules "C" and "D". (a) if the leachate elevations in Schedules "C" and "D" are not met within 105 days of the anniversary date of the issuance of this Approval the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below the leachate elevation in Schedules "C" and "D": (i) notify the District Manager; (ii) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site; (iii) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site; (iv) install interim cover to cells that have not reached final waste contours and to the working face; (v) install final cover to cells that have reached final waste contours; (vi) establish vegetation on installed cover material where appropriate and weather permitting; and (vii) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate. (b) landfilling activities may commence again when the compliance leachate elevation has been attained; and (c) prior to amending the Leachate Removal Plan proposed amendments shall be submitted to the District Manager for approval.	Acknowledged	
(7) If the leachate elevation in the landfill reaches 199.0 metres AMSL, the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below 199.0 metres AMSL: (a) notify the District Manager; (b) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site; (c) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site; (d) install interim cover to cells that have not reached final waste contours and to the working face; (e) install final cover to cells that have reached final waste contours; (f) establish vegetation on installed cover material where appropriate and weather permitting; and (g) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.	Acknowledged	
(8) The Owner shall monitor leachate in accordance with the monitoring program outlined in Schedule "B".	Acknowledged	

Table 9.1

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
6. LANDFILL GAS MANAGEMENT		
(1) The Owner/Operator shall ensure that all buildings and structures containing enclosed spaces at the Site, shall be situated, constructed and monitored in a manner which minimizes the potential for explosive hazards due to landfill gas. The Owner/Operator shall install and maintain in good working condition, methane detection and alarm equipment (with active venting or with an effective passive venting system to relieve any possible landfill gas accumulation) for all enclosed buildings at the Site.	Complete	
(2) The Owner/Operator shall ensure that site design plans, specifications and descriptions for the control of landfill gas are such that the subsurface migration of landfill gas meets the requirements of the Ministry's Landfill Standards Guideline, Section 4.10, including but not limited to the following: (a) the concentration of methane gas below the ground surface at the Site boundary must be less than 2.5 per cent by volume; (b) the concentration of methane gas in any on-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, if the building or structure is accessible to any person or contains electrical equipment or a potential source of ignition, must be less than 1.0 per cent by volume; (c) sub-condition (b) does not apply to a leachate collection, storage or treatment facility or a landfill gas collection or treatment facility for which specific health and safety measures and procedures are in place relating to the risk of asphyxiation and the risk of explosion; and (d) the concentration of methane gas from the Site in any off-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, must be less than 0.05 per cent by volume (i.e. not present).	Acknowledged	
(3) If the measured gas concentration at a gas probe exceeds the applicable limit listed in Condition 6(2) above, the District Manager shall be notified immediately. The gas concentrations shall be re-measured immediately and daily for a period of up to three (3) consecutive days. If these readings confirm that the applicable limit has been exceeded, the Owner/Operator shall forthwith, implement appropriate control measures.	Acknowledged	
(4) The Owner shall monitor landfill gas in accordance with the monitoring program outlined in Schedule "B".	Acknowledged	
7. STORMWATER MANAGEMENT		
(1) Stormwater runoff generated from the active waste fill area shall be treated by the Owner/Operator as leachate. The Owner/Operator shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system. If necessary, granular sumps shall be dug into the waste to facilitate drainage of contaminated stormwater towards the leachate collection system.	Acknowledged	
(2) The Owner shall monitor the stormwater management pond in accordance with the monitoring program outlined in Schedule "B".	Acknowledged	
8. EMPLOYEE TRAINING		
(1) A training plan for all employees that operate any aspect of the Site shall be developed and implemented by the Owner or the Operator. Only Trained Personnel shall operate any aspect of the Site or carry out any activity required under this Approval.	Acknowledged	
(2) The Owner shall ensure that all site operations employees have been adequately trained and received on-going training with respect to the following, but not limited to: (a) terms, conditions and operating requirements of this Approval for the Site; (b) the operation, inspection, and maintenance of the Site with respect to the approved design and operations documents; (c) relevant waste management legislation and regulations; (d) environmental concerns related to waste management at the Site; (e) occupational Health and Safety concerns related to waste management at the Site; and (f) emergency procedures and contingency plans in case of fire, spills, off-site impacts and any other emergency situations.	Acknowledged	
9. COMPLAINTS RESPONSE PROCEDURE		
(1) If at any time the Owner receives complaints regarding the operation of the Site, the Owner shall respond to these complaints according to the following procedure: (a) The Owner shall record and number each complaint, either electronically or in a log book, and shall include the following information: the nature of the complaint, the name, address and the telephone number of the complainant if the complainant will provide this information and the time and date of the complaint; (b) The Owner, upon notification of the complaint, shall initiate appropriate steps to determine possible causes of the complaint, proceed to take the necessary actions to eliminate the cause of the complaint and forward a written reply to the complainant; and (c) The Owner shall complete and retain on-site a report written within one (1) week of the complaint date, listing the actions taken to resolve the complaint and recommendations, if any, for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents.	Acknowledged	
10. EMERGENCY AND SPILL RESPONSE		
(1) All Spills as defined in the EPA occurring at or from the Site shall be immediately reported to the Ministry's Spills Action Centre at 1-800-268-6060 and shall be recorded in the log book. The Owner/Operator shall record for each Spill event the contaminant(s) spilled, the quantity or volume of contaminants spilled, the spatial distribution of the area impacted by the Spill, a root cause analysis of the events leading up to the Spill and a list of actions designed to prevent similar Spill events.	Acknowledged	
(2) In addition, the Owner shall submit, to the District Manager a written report within three (3) business days of the Spill event, outlining the nature of the incident, remedial measures taken, handling of waste generated as a result of the emergency situation and the measures taken to prevent future occurrences at the Site.	Acknowledged	
(3) All wastes resulting from a Spill event shall be managed and disposed of in accordance with the EPA and Regulation 347.	Acknowledged	
(4) All equipment and materials required to handle the Spill event shall be: (a) kept on hand at all times that waste landfilling and/or handling is undertaken at the Site; and (b) adequately maintained and kept in good repair.	Acknowledged	
(5) The Owner shall ensure that the emergency response personnel are familiar with the use of such equipment and its location(s).	Acknowledged	
11. PUBLIC LIAISON COMMITTEE (PLC)		
(1) The Owner or Operator shall maintain and participate in a landfill PLC, which shall function in accordance with the Terms of Reference for the PLC, as amended from time to time. Any amendment to the Terms of Reference must be approved by the District Manager. The PLC shall serve as a forum for dissemination, consultation, review and exchange of information regarding the operation of the landfill Site, including environmental monitoring, maintenance, complaint resolution, and new approvals or amendments to existing approvals related to the operation of this landfill Site.	Acknowledged	
(2) The Owner/Operator shall invite representation from the following groups to participate on the PLC: (a) the County of Haldimand; (b) Six Nations of the Grand River; (c) landowners within a minimum 500 metre distance of the Site; (d) residents of Haldimand County; and (e) Lower Grand River Land Trust. The number of representatives from each group shall be as specified in the Terms of Reference approved by the District Manager.	Acknowledged	
(3) Copies of all reports or other submissions required by the conditions of this Approval shall be made available to the PLC and the County of Haldimand, in accordance with the deadlines specified in the Conditions.	Acknowledged	
(4) The Owner or Operator shall provide to the PLC and the County of Haldimand, reasonable notice and opportunities to make comments regarding any proposed amendment to this Approval. The Owner or Operator shall forward to the Director for consideration any written comments received by the Owner or Operator and advise the Director of the essence of any verbal comments received by the Owner or Operator regarding the proposed amendment.	Acknowledged	
12. INSPECTIONS, RECORD KEEPING AND REPORTING **Daily Inspections and Inspection Log** (1) A visual inspection of the entire Site and all equipment on the Site shall be conducted each day the Site is open to ensure that: (a) the Site is secure; (b) the operation of the Site is not causing any nuisances; (c) the operation of the Site is not causing any adverse effects on the environment or impairing water quality; and (d) the Site is being operated in compliance with this Approval.	Acknowledged	
(2) Any deficiencies discovered as a result of the inspection shall be remedied immediately, including temporarily ceasing operations at the Site if needed.	Acknowledged	

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
(3) An electronic or written record of the inspections shall be maintained and shall include the following: (a) the name and signature of person that conducted the inspection; (b) the date and time of the inspection; (c) the list of all deficiencies discovered during the inspections, including but not limited to: (i) the presence of any leachate seeps; (ii) the condition of the methane venting system; (iii) poor drainage conditions and ponding of surface water; and (iv) the presence of waste outside of the approved fill area; (d) the recommendations for remedial action to address the identified deficiencies; and (e) the date, time and description of the remedial actions taken.	Acknowledged	
Daily Waste Log (4) A daily log shall be maintained in written or electronic format and shall include the following information: (a) the type, date and estimated quantity (tonnes) of all waste, including non-landfilled waste received at the Site; (b) the type, date and estimated quantity (tonnes) of cover material applied at the Site; (c) the area of the Site in which waste disposal operations are taking place; (d) a record of litter collection activities and the application of any dust suppressants; (e) a record of all refusals of waste shipments, the reason(s) for refusal, and the origin of the waste, if known; and (f) a description of any out-of-service period of any control, treatment, disposal or monitoring facilities, the reasons for the loss of service, and action taken to restore and maintain service.	Acknowledged	
Other Information (5) Any information requested, by the Director, the District Manager or a Provincial Officer, concerning the Site and its operation under this Approval, including but not limited to any records required to be kept by this Approval shall be provided to the Ministry, upon request.	Acknowledged	
Annual Report (6) A written report on the development, operation and monitoring of the Site, shall be completed annually (the "Annual Report"). The Annual Report shall be submitted to the District Manager, by March 31st of the year following the period being reported upon. (7) The Annual Report shall include but not be limited to the following information: (a) the results and an interpretive analysis of the results of all leachate, groundwater surface water and landfill gas monitoring, including an assessment of the need to amend the monitoring programs; (b) an assessment on the Site's compliance with Guideline B7; (c) an assessment of the operation and performance of all engineered facilities, the need to amend the design or operation of the Site, and the adequacy of and need to implement the Ministry approved contingency plans; (d) site plans showing the existing contours of the Site; areas of landfilling operation during the reporting period; areas of intended operation during the next reporting period; areas of excavation during the reporting period; the progress of final cover, vegetative cover, and any intermediate cover application; facilities existing, added or removed during the reporting period; and site preparations and facilities planned for installation during the next reporting period; (e) summaries of any actions taken for the odour management plan and compliance with the leachate removal plan; (f) calculations of the volume of waste, daily and intermediate cover, and final cover deposited or placed at the Site during the reporting period and a calculation of the total volume of Site capacity used during the reporting period; (g) a calculation of the remaining capacity of the Site or an estimate of the remaining Site life; (h) summary of total annual quantity (tonnes) of waste received at the Site; (i) a summary of any complaints received and the responses made; (j) a summary of the information included in the logs required by Conditions 9(1), 10(1), 11(3), 11(4), 11(5), and 12(2); (k) a summary of the daily waste log; (l) a discussion of any operational problems encountered at the Site and corrective action taken; (m) any changes to the Ministry approved Design and Operations Report and the Closure Plan that have been approved by the Director since the last Annual Report; (n) a report on the status of all monitoring wells and a statement as to compliance with Regulation 903; (o) a description and location of any leachate seeps identified during the daily inspection of the Site and the mitigative measures taken to address the presence of seeps; (p) a summary of the daily inspections conducted over the monitoring period; (q) any other information with respect to the Site which the District Manager may require from time to time; (r) a copy of the most current ministry approved monitoring programs in table format; (s) compliance status with all conditions of the Approval and the approved Design and Operations Plan; (t) a "Monitoring and Screening Checklist" completed and signed by a Qualified Professional; and (u) items identified in Section 7.7 Annual Progress Report of the Design and Operations Report;	Acknowledged	

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
13. CLOSURE PLAN		
(1) At least two (2) years prior to the anticipated date of closure of this Site, or when the Site reaches 90% capacity, whichever comes first, the Owner shall submit to the Director for approval, with copies to the District Manager, a detailed Site closure plan pertaining to the termination of landfilling operations at this Site, post-closure inspection, maintenance and monitoring, and end use. The plan shall include but not be limited to the following information:		
(a) A plan showing Site appearance after closure;		
(b) A description of the proposed end-use of the Site;		
(c) Description of the procedures for closure of the Site, including:		
i. advance notification of the public of the landfill closure;		
ii. posting of a sign at the Site entrance indicating the landfill is closed and identifying any alternative waste disposal arrangements;		
iii. completion, inspection and maintenance of the final cover and landscaping;		
iv. site security;		
v. removal of unnecessary landfill-related structures, buildings and facilities;	Acknowledged	
vi. final construction of any control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas; and		
vii. a schedule indicating the time-period for implementing sub-conditions (i) to (vi) above.		
(d) Description of the procedures for post-closure care of the Site, including:		
i. operation, inspection and maintenance of the control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas;		
ii. record keeping and reporting; and		
iii. complaint contact and response procedures;		
(e) An assessment of the adequacy of and need to implement the contingency plans for leachate and landfill gas;		
(f) An updated estimate of the contaminating life span of the Site, based on the results of the monitoring programs to date; and		
(g) An update of the cost estimate for financial assurance and the amount which has been provided to the Director.		
(2) The Site shall be closed in accordance with the closure plan as approved by the Director.	Acknowledged	
The following Schedule "A" forms part of this Approval		
Schedule "A"		
1. Application for an amendment to ECA No. A110302 for a vertical expansion. Signed by Richard Weldon, Managing Partner, 2270386 Ontario Limited. Dated April 26, 2019. The application includes all supporting documentation and consists of the following:		
i. Design and Operations Report Vertical Expansion, Brooks Road Landfill Site, 2270386 Ontario Inc., Prepared by GHD, April 18, 2019;		
ii. Appendix A - Provisional CofA No. A110302 and Amendments;		
iii. Appendix B - Site Preparation Reports;		
iv. Appendix C - Site Legal Surveys;		
v. Appendix D - Geotechnical Assessment;		
vi. Appendix E - HELP Model Outputs;		
vii. Appendix F - Hydrologic Modeling;		
vii. Appendix G - Surface Water Supporting Engineering Calculations;		
viii. Appendix H - Landfill Gas Production and Air Dispersion Modeling Results;		
ix. Appendix I - Fugitive Odour Best Management Practices Plan and BRE Odour Complaint Response Procedure;		
ix. Appendix J - Trigger Level Program;		
ix. Appendix K - Financial Assurance Plan; and		
ix. Appendix L - Design and Operations Report Drawings.		
2. Leachate Removal Plan, Brooks Road landfill Site Haldimand County, 2270386 Ontario Limited. Report No 90. Prepared by GHD, February 7, 2020.		
The following Schedule "B" forms part of this Approval		
Schedule "B"		
Table B1: Groundwater, Surface Water, Leachate and Landfill Gas Monitoring Programs		
Notes:		
1. Groundwater levels will be measured during May and November sampling events.		
2. Surface water levels and flows will be measured for all sampling events.		
3. A - Indicator parameters (groundwater): alkalinity, ammonia, barium, boron, calcium, chloride, conductivity, iron, magnesium, nitrate, pH, sodium, TDS, sulphate, COD, and DOC.		
4. B - Metals: aluminum, arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, nickel.		
B - PAHs: naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(j)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, benzo(ghi)perylene.		
B - VOCs: chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, trans-1,2-dichloroethene, methyl-t-butyl ether, 1,1-dichloroethane, methyl ethyl ketone, cis-1,2-dichloroethene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane trichloroethene, bromodichloromethane, cis-1,3-dichloropropene, methyl isobutyl ketone, trans-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m,p,o-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene.		
B - Inorganic chemistry parameters: alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulfates, DOC, TDS, suspended solids, phenol, BOD5, COD, pH, total phosphorus, potassium, conductivity, calcium.		
5. C - Indicator parameters (surface water): alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, pH, total phosphorus, TDS, suspended solids, sulphate, BOD5, COD, phenol, temperature, and dissolved oxygen.		
6. WL - only: water level or leachate level only.		
7. Leachate: Leachate water levels shall be collected on a monthly basis at leachate monitoring well LW1-17 and the inclined leachate collection sump riser pipe, while an annual leachate chemistry sample is required to be collected in May from the collection sump. Compliance with the leachate level elevation shall be determined by the pressure transducer that is located in the leachate collection sump riser pipe.		
8. Landfill Gas: Sampling is to occur monthly from December 1 to April 30 and quarterly from May through November for % lower explosive limit methane concentration of combustible gas, carbon dioxide, oxygen and balance gases, gas pressure, and water level.		
The following Schedule "C" forms part of this Approval		
Schedule "C"

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
EA Compliance Report and Monitoring Commitments		
4.1 The Proponent shall prepare and submit to the Director for approval and for the public record, an Environmental Assessment compliance monitoring program.	Complete	
4.2 The compliance monitoring program shall be submitted within one year from the Date of Approval, or 60 days before the commencement of Construction, whichever is earlier, or by another date agreed upon by the Director.	Complete	
4.3 The compliance monitoring program shall include a description of how the Proponent will: a. monitor implementation of the Undertaking in accordance with the Environmental Assessment with respect to mitigation measures, public consultation, and additional studies and work to be carried out; b. monitor compliance with the conditions in this Notice of Approval; and, c. monitor compliance with all commitments made in the Environmental Assessment and the subsequent review of and approval process for the Environmental Assessment with respect to mitigation measures, public consultation, and additional studies and work to be carried out.	Complete	
4.4 The compliance monitoring program must contain an implementation schedule for monitoring activities to be completed.	Complete	
4.5 The Director may require the Proponent to amend the compliance monitoring program at any time. Should an amendment be required, the Director will notify the Proponent in writing of the required amendment and the date by which the Proponent must complete and submit the amendment to the Director.	Acknowledged	
4.6 The Proponent shall submit the amended compliance monitoring program to the Director within the time period specified by the Director.	Acknowledged	
4.7 The Proponent shall implement the compliance monitoring program and any amendments to it.	Acknowledged	
5.1 The Proponent shall prepare an annual compliance report outlining the results of the compliance monitoring program (Condition 4 above) and place the document on the public record.	Acknowledged	
5.2 The first compliance report shall be submitted to the Director for review and for the public record no later than one year following the Date of Approval. Each subsequent annual compliance report shall be submitted on the date that is the anniversary of the Date of Approval thereafter. Each report shall cover the previous year to the date of report submission.	Acknowledged	
5.3 The Proponent shall submit annual compliance reports until all conditions are satisfied.	Acknowledged	
5.4 Once all conditions in this Notice of Approval have been satisfied, the Proponent shall notify the Director in writing that the final annual compliance report is being submitted, and that all conditions in this Notice of Approval have been satisfied. The Ministry will confirm whether all conditions have been satisfied and the Director will state this in writing to the Proponent.	Acknowledged	
5.5 The Proponent shall retain either on the Site or in another location approved by the Director, copies of the annual compliance reports for each reporting year and any associated documentation of compliance monitoring activities.	Acknowledged	
5.6 The Proponent shall make the compliance reports and associated documentation available to the Director or a designate in a timely manner when requested to do so by the Ministry.	Acknowledged	
6. Complaint Protocol		
6.1 The Proponent shall prepare and implement a complaint protocol that sets out provisions for dealing with and responding to inquiries and complaints during all stages of the Undertaking. The complaint protocol shall include a procedure for notifying the Ministry's Hamilton District Office of the complaints received.	Complete	
6.2 The Proponent shall submit the complaint protocol to the Director for approval and for the public record within one year from the Date of Approval, or 60 days before the start of Construction, whichever is earlier, or by another date agreed upon by the Director.	Complete	
6.3 The Director may require the Proponent to amend the complaint protocol at any time. Should an amendment be required, the Director shall notify the proponent in writing of the amendment required and when the amendment must be completed.	Acknowledged	
6.4 The Proponent shall submit the amended complaint protocol to the Director within the time period specified by the Director.	Acknowledged	
6.5 The Proponent shall implement the complaint protocol and any amendments to it.	Acknowledged	
6.6 The Proponent shall provide a summary on the complaints received and how they were addressed as part of the annual compliance reporting (Condition 5) and post the summary on the website as part of the public record.	Acknowledged	
7 Consultation with Indigenous Communities		
7.1 The Proponent shall prepare, in consultation with Indigenous Communities, an Indigenous consultation plan that sets forth: a. how, during the planning, design, Construction, operation, and closure of the Undertaking, the Proponent will consult with Indigenous Communities and provide them with opportunities to be involved in environmental monitoring activities; b. how the Proponent will notify Indigenous Communitis, using a notification protocol, if archaeological resources or Indigenous remains are encountered during the planning, design, Construction, operation, and closure of the Undertaking; and, c. how the Proponent will issue notices and updates to Indigenous communities on key steps in the planning, design, Construction, operation, and closure of the Undertaking.	Complete	
7.2 90 days before the start of Construction or by such other date as may be agreed to in writing by the Director, the Proponent shall submit the Indigenous consultation plan to the Director for approval, with an outline of how the Proponent consulted on it as be Condition 7.1 above.	Complete	
7.3 Once the Director is satisfied with the Indigenous consultation plan, the Proponent shall implement the Indigenous consultation plan durin gthe planning, design, Construction, operation, and closure of the Undertaking	Acknowledged	
8. Air Quality and Odour		
8.1 When applying for an Environmental Compliance Approval, the Proponent shall provide, to the satisfaction of the Ministry, the following as part of its application: a. an emissions summary and dispersion modelling report that includes landfill gas; b. an odour assessment and modelling report for the expanded landfill Site; c. a dust management plan for the Site which shall include fugitive dust emissions from all sources at the Site; and d. an odour management plan detailing the measures for addressing the potential odours that may emanate from the Site.	Complete	
8.2 The Proponent shall prepare and implement a landfill gas mitigation plan that specifies measures for monitoring and reducing landfill gas emissions for the Construction, operation, closure and post-closure phases of the expanded landfill Site. The Proponent shall report on changes in landfill gas production in its annual compliance report (Condition 5 above).	Acknowledged	
9. Groundwater and Surface Water Protection		
9.1 When applying for an Environmental Compliance Approval, the Proponent shall provide, to the satisfaction of the Ministry, the following information as part of its application. A. information documenting the performance of the existing leachate management system at the Site; b. a description in the design and operations report on how the Proponent will manage the rate of fill and potential leachate generation; and, c. a leachate management plan for the vertical landfill expansion.	Complete	
10 Extreme Weather Events		
10.1 When applying for an Environmental Compliance Approval, the Proponent shall provide to the satisfaction of the Ministry as part of its application, an assessment of landfill vulnerability to side slope stability failure due to extreme weather events. The Proponent shall complete a slope stability modelling exercise to determine the appropriate safety factor to be applied to the design of the vertically expanded landfill and identify appropriate mitigation and contingency measures to prevent side slope failure.	Complete	
11 Waste Diversion		
11.1 The Proponent shall develop and implement a waste diversion protocol which shall contain information on awareness programs for waste generators and haulers, and on-site waste segregation protocols to maximize the diversion of industrial, commercial and institutional waste, including organics. The Proponent shall submit the waste diversion protocol to the Ministry in its application for an Environmental Compliance Approval and report industrial, commercial and institutional waste diversion amounts in its annual compliance report (Condition 5 above).	Complete	

Table 9.1

Summary of Environmental Compliance Approval
2021 Operations and Monitoring Report
Brooks Road Landfill Site
Haldimand County, Ontario

Conditions	Status	Comments
12. Wetland and Species at Risk Protection 12.1 The Proponent shall install a permanent silt fence that extends the entire perimeter of the Site property to exclude wildlife from accessing the Site. This exclusion fence shall be routinely monitored and maintained in good working condition throughout the Construction, operation and closure of the landfill.	Complete	Construction of silt fencing completed in 2021.
12.2The Proponent shall train staff in the identification of Blanding's Turtle and other Species at Risk known to be within the general vicinity of the Site. Training shall include Specieis at Risk awareness and the appropriate steps to take upon encountering a Species at Risk. In the event that a Species at Risk is found on the Site property, all activities that could potentially harm the animal shall cease and a Minitry of Natural Resources and Forestry biologist shall be contacted.	Complete	GHD prepared a Site-specific SAR identification guide for Brooks Road Environmental Site staff and visitor use.
12.3 The Proponent shall develop and implement a wetland monitoring program to demonstrate that there are no impairments to the water quality, quantity, vegetation, or wildlife in the Cayuga Swamp Wetland Complex located adjacent to the Site as a result of the Undertaking. The Proponent shall prepare wetland monitoring reports outlining the results of the wetland monitoring program. The Proponent shall provide copies of the wetland monitoring reports to the Ministry of Natural Resources and Forestry and submit them to the Ministry as part of its annual compliance report (Condition 5 above).	Acknowledged	A Wetland Monitoring report was submitted in February 2022.
13. Duration of Approval 13.1 If Construction has not commenced within 2 years of the Date of Approval, the Proponent shall conduct a review of the Environmental Assessment and submit that review to the Director. The review shall look at the potential environmental effects and mitigation measures, and identify any changes to these components. If Construction has not commenced within 5 years of the Date of Approval, this Notice of Approval shall expire.	Complete

ENVIRONMENTAL COMPLIANCE APPROVAL
NUMBER 8922-9ZHR29
Issue Date: October 8, 2015

2270386 Ontario Limited
160 Cumberland Ave, No. 300
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd, Lot 24, Concession 1, North of Talbot Road Haldimand County, Ontario

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act , R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

- one (1) shredder, equipped with a diesel engine rated at 315 kilowatts, having a production rate of 30 tonnes per hour;

all in accordance with the Application for Environmental Compliance Approval (Air and Noise) and all supporting information dated September 3, 2014, and signed by Paul Zizek of 2270386 Ontario Limited.

For the purpose of this environmental compliance approval, the following definitions apply:

1. "Approval" means this Environmental Compliance Approval, including the application and supporting documentation listed above.

2. "Company" means 2270386 Ontario Limited, that is responsible for the construction or operation of the Plant and includes any successors and assigns.

3. "Director" means a person appointed by the Minister pursuant to section 5 of the EPA.

4. "District Manager" means the District Manager of the appropriate local district office of the Ministry, at the geographic location where the Plant is operated.

5. "EPA" means the Environmental Protection Act , R.S.O. 1990, c.E.19, as amended.

6. "Equipment" means the equipment and processes described in the Company's application, this Approval and in the supporting documentation referred to herein, to the extent approved by this Approval.

7. "Facility" means the entire operation where the Equipment is located.

8. "Manual" means a document or a set of documents that provides written instructions to staff of the Company.

9. "Ministry" means the ministry of the government of Ontario responsible for the EPA and includes all officials, employees or other persons acting on its behalf.

10. "Publication NPC-300" means the Ministry Publication NPC-300, "Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning, Publication NPC-300", August, 2013, as amended.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

PERFORMANCE REQUIREMENTS

1. The Company shall ensure that the noise emissions from the Facility comply with the limits determined in accordance with Ministry Publication NPC-300.

OPERATION AND MAINTENANCE

2. The Company shall ensure that the Equipment is properly operated and maintained at all times. The Company shall:

(1) prepare, not later than three (3) months after the date of this Approval, and update, as necessary, a Manual outlining the operating procedures and a maintenance program for the Equipment, including:

(a) routine operating and maintenance procedures in accordance with good engineering practices, and as recommended by the Equipment suppliers;

(b) emergency procedures;

(c) procedures for any record keeping activities relating to operation and maintenance of the Equipment;

(d) all appropriate measures to minimize noise and dust emissions from all potential sources;

(e) procedures for recording and responding to environmental complaints relating to the operation of the Equipment; and

(2) implement the recommendations of the Manual.

FUGITIVE DUST CONTROL

3. The Company shall prepare, before commencement of operation of the Equipment, implement and update as necessary, a Best Management Practices Plan for the control of fugitive dust emissions from the Facility. This Best Management Practices Plan shall include, but not be limited to:

(1) identification of the main sources of fugitive dust emissions such as:

(a) on-site traffic;

(b) paved roads/areas;

(c) unpaved roads/areas;

(d) material stock piles;

(e) loading/unloading areas and loading/unloading techniques;

(f) material spills;

(g) material conveyance systems;

(h) exposed openings in process and storage buildings; and

(i) general work areas;

(2) potential causes for high dust emissions and opacity resulting from these sources;

(3) preventative and control measures in place or under development to minimize the likelihood of high dust emissions and opacity from the sources of fugitive dust emissions identified above. Details of the preventative and control measures shall include:

(a) a description of the control equipment to be installed;

(b) a description of the preventative procedures to be implemented; and/or

(c) the frequency of occurrence of periodic preventative activities, including material application rates as applicable;

(4) an implementation schedule for the Best Management Practices Plan, including training of personnel; and

(5) inspection and maintenance procedures and monitoring initiatives to ensure effective implementation of the preventative and control measures.

RECORD RETENTION

4. The Company shall retain, for a minimum of two (2) years from the date of their creation, all records and information related to or resulting from the recording activities required by this Approval, and make these records available for review by staff of the Ministry upon request. The Company shall retain:

(1) all records on the maintenance, repair and inspection of the Equipment;

(2) all records of any upset conditions associated with the operation of the Equipment;

(3) all records on the environmental complaints, including:

(a) a description, time, date and location of each incident;
(b) operating conditions (e.g. upset conditions, etc.) at the time of the incident;
(c) wind direction and other weather conditions at the time of the incident;
(d) the name(s) of Company personnel responsible for handling the incident;

(e) the cause of the incident;
(f) the Company's response to the incident; and
(g) a description of the measures taken to address the cause of the incident and to prevent a similar occurrence in the future, and the outcome of the measures taken.

NOTIFICATION REQUIREMENTS

5. The Company shall notify the District Manager, in writing, of each environmental complaint within two (2) business days of the complaint. The notification shall include:

(1) a description of the nature of the complaint;
(2) a description, time, date and location of each incident;
(3) operating conditions (e.g. upset conditions, etc.) at the time of the incident;
(4) wind direction and other weather conditions at the time of the incident;
(5) the name(s) of Company personnel responsible for handling the incident;
(6) the cause of the incident;
(7) the Company response to the incident; and
(8) a description of the measures taken to address the cause of the incident and to prevent a similar occurrence in the future, and the outcome of the measures taken.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition Nos. 1 to 3, inclusive, are included to provide the minimum performance requirements considered necessary to prevent an adverse effect resulting from the operation of the Equipment and to emphasize that the Equipment must be maintained and operated according to a procedure that will result in compliance with the EPA, the regulations and this Approval.

2. Condition No. 4 is included to require the Company to keep records and to provide information to the Ministry so that compliance with the EPA, the regulations and this Approval can be verified.

3. Condition No. 5 is included to require the Company to notify/report to the Ministry so that compliance with the EPA, the regulations and this Approval can be verified.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me, the Environmental Review Tribunal and in accordance with Section 47 of the Environmental Bill of Rights, 1993 , S.O. 1993, c. 28 (Environmental Bill of Rights), the Environmental Commissioner, within 15 days after receipt of this Notice, require a hearing by the Tribunal. The Environmental Commissioner will place notice of your appeal on the Environmental Registry. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

1. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
2. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

The Notice should also include:

3. The name of the appellant;
4. The address of the appellant;
5. The environmental compliance approval number;
6. The date of the environmental compliance approval;

7. The name of the Director, and;
8. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary* Environmental Review Tribunal 655 Bay Street, Suite 1500 Toronto, Ontario M5G 1E5	AND	The Environmental Commissioner 1075 Bay Street, Suite 605 Toronto, Ontario M5S 2B1	AND	The Director appointed for the purposes of Part II.1 of the Environmental Protection Act Ministry of the Environment and Climate Change 135 St. Clair Avenue West, 1st Floor Toronto, Ontario M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 326-5370 or www.ert.gov.on.ca**

This instrument is subject to Section 38 of the Environmental Bill of Rights, 1993, that allows residents of Ontario to seek leave to appeal the decision on this instrument. Residents of Ontario may seek leave to appeal within 15 days from the date this decision is placed on the Environmental Registry. By accessing the Environmental Registry at www.ebr.gov.on.ca , you can determine when the leave to appeal period ends.

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 8th day of October, 2015

Rudolf Wan, P.Eng.
Director
appointed for the purposes of Part II.1 of
the *Environmental Protection Act*

QN/
c: District Manager, MOECC Hamilton - District
Matthew Griffin, Conestoga-Rovers & Associates

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 1122-BKUPSM
Issue Date: February 3, 2020

2270386 Ontario Limited
162 Cumberland St
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd, Lot 24, Concession 1 North of Talbot Road
County of Haldimand

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

A stormwater management facility and a leachate collection, treatment, and disposal system to service the Brooks Road Landfill Site (formerly Edwards Landfill Site), located in Part of Lot 24, Concession 1, North of Talbot Road, Haldimand County, discharging to a roadside ditch along the east side of Brooks Road, consisting of the following:

Leachate Treatment System

A leachate treatment system designed and installed for a Rated Capacity of 200 m³/day to service the Brooks Landfill Site, located at the south-central side of the landfill site, with an effluent discharge system to discharge effluent to a roadside ditch along Brooks Road with a Rated Capacity of 45 m^3 /day, with a Peak Daily Flow of 60 m^3/day and such other removal of effluent from the Landfill Site in compliance with law, including Ontario Regulation 347, and consisting of the following:

- One (1) leachate collection sump located in the south-east corner of Stage One part of the landfill, equipped with one (1) 6.3 L/sec at 14 m TDH pump discharging through one (1) approximately 35 m long 76.2 mm diameter forcemain into the primary settling tank described below.

- One (1) 28 m³ **Primary Settling Tank** receiving leachate from the existing leachate collection sump, equipped with baffle walls and one (1) 7 L/sec at 9.0 m TDH PST pump, three (3) level floats, and pH monitor, discharging through one (1) 500 micron opening strainer installed on the

feed line to an aeration system described below.

- One (1) **Aeration System** comprising of two (2) 114 m³ capacity concrete tanks in series each aeration tank equipped with 1" lateral air diffusers, two (2) air blowers each with 910 m³/hr (530 cfm) capacity at 13 psi head loss, and the second aeration tank fitted with three (3) level floats, discharging via one (1) 66 m³/hr capacity at 106 m TDH feed pump to the Membrane Biofiltration Reactor (MBR) treatment system described below.

- One (1) 200 m³/day Rated Capacity **Membrane Biofiltration Reactor (MBR) Treatment System** consisting 8 mm diameter membranes housed in four (4) 200 mm diameter tubular modules installed in series and providing a filtration surface area of 36.7 m² per module, designed to operate at maximum pressure of 8 Bar (116 psi) at 40º C with a circulation velocity of 3 m/sec, providing a total filtration area of 146.8 m², equipped with one (1) 200 m³/hr capacity MBR recirculation pump to be used to recirculate activated sludge across the membranes, discharging to a UV disinfection system described below.

- Two (2) **UV Disinfection Units** operating in parallel, each unit capable of providing minimum UV dosage of 40 mJ/cm² at a flow of 114 L/min, discharging by gravity to an effluent transfer tank described below.

- Effluent discharge system consisting of:
  - One (1) 12.5 m³ capacity **Effluent Transfer Tank** equipped with one (1) 7 L/sec at 11 m TDH capacity effluent pump and three (3) level floats, to be used as temporary storage tank to transfer effluent to the existing effluent discharge holding tanks described below.
  - Three (3) 150 m³ capacity **Effluent Discharge Holding Tanks.**
  - Discharge piping from the **Effluent Discharge Holding Tanks** and flow measuring device for a Rated Capacity of 45 m^3/day with a Peak Daily Flow of 60 m^3/day, discharging to the roadside ditch.
  - Discharge piping from the **Effluent Discharge Holding Tanks** and control valve for loading of haulage units for lawful removal of effluent from the Site

- One (1) 12.5 m³ capacity **Sludge Storage Tank**, providing approximately eight (8) days sludge storage capacity, equipped with one (1) 7 L/sec at 7 m TDH capacity sludge pump transferring sludge to the landfill for disposal.

- A chemical feed system consisting of:

  Nitrification
  - one (1) 9 L/hr at 44 psi capacity chemical metering pump dosing **magnesium hydroxide** from a dual wall storage tank to the aeration tank described above for alkalinity control.

  Phosphorus Removal
  - one (1) 9 L/hr at 44 psi capacity chemical metering pump dosing **alum** into the feed line of the aeration tank described above for phosphorus removal.

  Acid Cleaning

- one (1) 24 L/hr at 145 psi capacity chemical metering pump dosing **citric acid** into the MBR feed piping during an acid cleaning of the membranes to remove calcified minerals.

Oxidation Cleaning
- one (1) 78 L/hr at 145 psi capacity chemical metering pump dosing **sodium hypochlorite** into the MBR feed piping during a chlorine cleaning of the membranes to remove accumulated sludge.

Alkaline Cleaning
- one (1) 24 L/hr at 145 psi capacity chemical metering pump dosing **magnesium hydroxide** into the MBR feed piping during an alkaline cleaning of the membranes to remove accumulated fats, oil, and grease.

Leachate Collection System

- a leachate collection, transmission, and storage, designed to handle a maximum of 60 m³/day of leachate generated from the site, consisting of two (2) 75.7 L/min capacity leachate pumps and one (1) 50 mm diameter HDPE forcemain.

Stormwater Management System

A stormwater management facility to service the Brooks Road Landfill Site with a total drainage area of 14.91 ha and an approved landfill footprint of 6.07 ha, designed to provide quantity and quality control of stormwater runoff from storm events with up to 1:100 year return frequency, consisting of the following:

Stormwater Management System (SWMS)

A stormwater management system to provide quality and quantity control of stormwater runoff from the site during the active operation and post closure of the landfill site, consisting of the following:

- one (1) perimeter ditch running from the north-east corner of the landfill site along the east side and south side of the landfill foot print, having a 0.3 m bottom width, a minimum of 1.0 m depth, and 3H:1V side slopes on the road side, conveying collected stormwater runoff to a stormwater management pond described below.

- one (1) perimeter ditch running from the north-east corner of the landfill site along the north side and west side of the landfill foot print, having a 0.3 m bottom width, a minimum of 1.0 m depth, and 3H:1V side slopes on the road side, conveying collected stormwater runoff to a stormwater management pond described below.

- one (1) inlet structure including two (2) 600 mm diameter concrete culverts and an open swale covered with turf reinforcement mat discharging into a forebay described below.

- one (1) forebay with approximate length of 29 m, upstream width of 4 m and downstream width of 15 m, a permanent pool depth of 0.60 m, and side slopes of 4H:1V, equipped with a berm with top

elevation 197.85 m AMSL, discharging to a stormwater management pond described below.

- one (1) wet detention stormwater management pond **(SWMS Pond)** to be located on south west corner of the site providing a total storage capacity of 6,768 m³ consisting of a permanent pool storage volume of 1,266 m³ (at elevation 197.85 m AMSL) with a maximum depth of 0.60 m and an extended storage volume of 5,502 m³ with an extended storage depth of 0.34 m (at elevation of 198.19 m AMSL).

- one (1) outlet structure consisting of one (1) 150 mm diameter perforated PVC pipe with an invert elevation of 197.85 m AMSL, equipped with 75 mm orifice plate, an outlet control valve, and one (1) 600 mm x 1200 mm concrete catch basin, discharging to a roadside ditch along the east side of Brooks Road.

- one (1) emergency by-pass structure consisting of a 2.0 meter wide rip-rap spillway at invert elevation of 199.10 m AMSL discharging to a roadside ditch along Brooks Road,

Including all controls and associated appurtenances,

all in accordance with the submitted supporting documents listed in Schedule A.

For the purpose of this environmental compliance approval, the following definitions apply:

"Approval" means this entire document and any schedules attached to it, and the application;

"BOD5" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"CBOD5" means 5 day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in unfiltered sample;

"Daily Concentration" means the concentration of a contaminant in the effluent discharged over any single day, as measured by a composite or grab sample, whichever is required;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for purposes of Part II.1, EPA;

"District Manager" means the District Manager of the Hamilton District Office;

"EPA" means the Environmental Protection Act, R.S.O. 1990, c.E.19, as amended;

"Equivalent Equipment" means a substituted equipment or like-for-like equipment that meets the required quality and performance standards of a named equipment;

"Limited Operational Flexibility" (LOF) means any modifications that the Owner is permitted to make to the Works under this Approval;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Monthly Average Concentration" means the arithmetic mean of all Daily Concentrations of a contaminant in the effluent sampled or measured, or both, during a calendar month;

"Monthly Average Daily Flow" means the cumulative total sewage flow to the sewage works during a calendar month divided by the number of days during which sewage was flowing to the sewage works that month;

"Notice of Modifications" means the form entitled "Notice of Modifications to Sewage Works";

"Owner" means 2270386 Ontario Limited and its successors and assignees;

"OWRA" means the Ontario Water Resources Act, R.S.O. 1990, c. O.40, as amended;

"Previous Works" means those portions of the sewage works previously constructed and approved under an Approval;

"Proposed Works" means the sewage works described in the Owner's application, this Approval, to the extent approved by this Approval;

"Rated Capacity" means the Monthly Average Daily Flow for which the Works are approved to handle;

"Works" means the sewage works described in the Owner's application, and this Approval, and includes Proposed Works, Previous Works, and modifications made under Limited Operational Flexibility.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

I. GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with the description given in this Approval, and the application for approval of the Works.

(3) Where there is a conflict between a provision of any document in the schedule referred to in this Approval and the conditions of this Approval, the Conditions in this Approval shall take precedence, and where there is a conflict between the documents in the schedule, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the documents listed in the Schedule submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The Conditions of this Approval are severable. If any Condition of this Approval, or the application of any requirement of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within thirty (30) days of the change occurring:

(a) change of Owner or operating authority, or both.

(b) change of address of Owner or operating authority or address of new owner or operating authority.

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Partnerships Registration Act.

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the most current "Initial Notice or Notice of Change" (Form 1, 2 or 3 of O. Reg. 189, R.R.O. 1980, as amended from time to time), filed under the Corporations Information Act shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this Condition will refer to this Approval's number.

II. LEACHATE COLLECTION AND TREATMENT FACILITY

3. LEACHATE MANAGEMENT

(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site leachate treatment system

(a) Notwithstanding Condition 3(1), leachate generated at the landfill Site that is not treated using the on-site leachate treatment system shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.

(b) In the event there is effluent from leachate that has been treated in the on-site leachate treatment system that cannot be disposed of to the roadside ditch, such effluent may be disposed of to an off-site facility provided such disposal is completed lawfully, including pursuant to Ontario Regulation 347.

(2) Leachate generated at the Landfill Site that is not treated using the on-site leachate treatment system shall not be discharged to the natural environment at any time.

4. OPERATIONS AND MAINTENANCE

(1) Within six (6) months of the issuance date of this Approval, the Owner shall prepare and submit for approval to the Director and a copy to the District Manager a "Contingency and Remedial Action Plan for the Works (**On-site leachate treatment system**)" which shall provide detailed action plans that will be implemented during any event when the effluent limits set under Condition 6(1) are not met;

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the works.

(b) inspection programs, including frequency of inspection, for the works and the methods or tests employed to detect when maintenance is necessary.

(c) repair and maintenance programs, including the frequency of repair and maintenance for the works.

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager, and

(e) complaint procedures for receiving and responding to public complaints.

(3) The Owner shall maintain the operations manual up to date through revisions undertaken from time to time and retain a copy at the location of the sewage works. Upon request, the Owner shall make the manual available for inspection and copying by Ministry personnel.

5. EFFLUENT OBJECTIVES

(1) The Owner shall use best efforts to design, construct and operate the works with the objective that the concentrations of the materials named below as effluent parameters are not exceeded in the effluent from the Works.

Table 1 - Effluent Objectives	
Effluent Parameter	**Concentration Objective** (milligrams per litre unless otherwise indicated)
CBOD5	5.0
Total Suspended Solids (TSS)	5.0
Total Ammonia Nitrogen (TAN)	1.0
Total Phosphorus (TP)	0.2
Zinc	0.03
Phenols	0.005
Ethylbenzene	0.008

(2) As a further effluent objective, the Owner shall use best efforts to maintain the pH of the effluent from the works within the range of 6.5 to 8.5, inclusive, at all times.

(3) The Owner shall include in all reports submitted in accordance with Condition 12 a summary of the efforts made and results achieved under this Condition.

6. EFFLUENT LIMITS

(1) The Owner shall design, construct and operate the works such that the concentrations of the materials named below as effluent parameters are not exceeded in the effluent from the works.

Table 2 - Effluent Limits	
Effluent Parameter	**Concentration Limit** (milligrams per litre unless otherwise indicated)
Column 1	Column 2
CBOD5	10.0
Total Suspended Solids (TSS)	10.0
Total Ammonia as Nitrogen (TAN)	3.0
Total Phosphorus (TP)	0.29
Toxicity (Daphnia magna)	Non-acutely lethal
Toxicity (Rainbow Trout)	Non-acutely lethal
pH of the effluent maintained between 6.0 to 9.5, inclusive, at all times	

(2) The Owner shall ensure that monitoring results for effluent discharge parameters outlined in Condition 9(3) meet the concentration limits set out in Column 2 of subsection (1).

(3) For the purposes of determining compliance with and enforcing subsection (1):

(a) The Concentration of a parameter named in Column 1 of subsection (1), sampled in accordance with Condition 9(3) shall not exceed the corresponding maximum concentration set out in Column 2 of subsection (1).

(b) The pH of the effluent shall be maintained within the limits outlined in subsection (1), at all times.

(4) In the event of any instance of non-compliance with the effluent limits stipulated under Condition 6(1), the Owner shall implement the "Contingency and Remedial Action Plan for the Works (**On-site leachate treatment system**)" prepared under Condition 3(1), and shall determine appropriate control measures to achieve effluent limits and the time lines for the implementation of identified control measures. The Owner shall submit the proposed control measures and implementation time lines for approval to the Director and a copy to the District Manager.

(5) If compliance with effluent limits are not met within the time lines approved under Condition 6(4), the Owner shall discontinue effluent discharge from the Works and implement off-site disposal of leachate for proper treatment.

(6) In the event that any of the control measures proposed under Condition 6(4) require the installation or an upgrade of the Works, the Owner shall submit an application to the Director for an amendment of this Approval.

7. EFFLUENT - VISUAL OBSERVATIONS

(1) Notwithstanding any other condition in this Approval, the Owner shall ensure that the effluent from the works is essentially free of floating and settleable solids and does not contain oil or any other substance in amounts sufficient to create a visible film, sheen or foam on the receiving waters.

8. SPECIAL CONDITION

(1) The Owner shall operate the roadside ditch discharge system for the On-Site Leachate Treatment System at the approved Rated Capacity of 45 m^3/day and Peak Daily Flow of 60 m^3/day until an approval is issued by the Director to operate the roadside ditch discharge system at a higher rated capacity. To obtain approval for using the roadside ditch discharge system at a higher rated capacity, the Owner shall complete a detailed receiving surface water assimilative capacity study and submit the study report along with a proposal for effluent limits to the Ministry's Regional Technical Support Section for review and recommendation. Upon receiving review comments and recommendation of the effluent limits from the Technical Support Section, the Owner shall submit to the Director an application for amendment of this Approval and a detailed design brief for approval of the higher rated capacity for the roadside ditch discharge system.

9. EFFLUENT MONITORING AND RECORDING

The Owner shall, upon commencement of operation of the sewage works, carry out the following monitoring program:

(1) All samples and measurements taken for the purposes of this Approval are to be taken at a time and in a location characteristic of the quality and quantity of the effluent stream over the time period being monitored.

(2) Leachate grab samples shall be collected and analyzed at the following sampling point and at the sampling frequencies specified for each parameter listed:

Table 3 - Influent Leachate Monitoring
Sampling Point: Leachate Storage Tank

Parameters	Frequency	Parameter	Frequency
CBOD5	Monthly	Chlorides	Quarterly
Total Suspended Solids (TSS)	Monthly	Nitrate as Nitrogen	Quarterly
Total Ammonia as Nitrogen (TAN)	Monthly	Arsenic	Quarterly
Total Phosphorus (TP)	Monthly	Barium	Quarterly
pH	Monthly	Boron	Quarterly
Zinc	Monthly	Chromium	Quarterly
Phenols	Monthly	Copper	Quarterly
Ethylbenzene	Monthly	Iron	Quarterly
		Lead	Quarterly
		Benzo(a)pyrene	Quarterly
		Naphtalene	Quarterly
		Benzene	Quarterly
		Toluene	Quarterly

(3) Effluent samples shall be collected and analyzed at the following sampling point, at the sampling frequencies and using the sample type specified for each parameter listed:

Table 4 - Effluent Monitoring
Sampling Point: Effluent Discharge Pipe
Discharge to Brooks Road Ditch

Parameters	Sample Type	Frequency
CBOD5	Grab	Monthly
Total Suspended Solids (TSS)	Grab	Monthly
Total Ammonia as Nitrogen (TAN)	Grab	Monthly
Total Phosphorus (TP)	Grab	Monthly
pH	Grab	Monthly
Zinc	Grab	Monthly
Phenols	Grab	Monthly
Ethylbenzene	Grab	Monthly
Chlorides	Grab	Quarterly
Nitrate as Nitrogen	Grab	Quarterly
Arsenic	Grab	Quarterly
Barium	Grab	Quarterly
Boron	Grab	Quarterly
Chromium	Grab	Quarterly
Copper	Grab	Quarterly
Iron	Grab	Quarterly
Lead	Grab	Quarterly
Benzo(a)pyrene	Grab	Quarterly
Naphtalene	Grab	Quarterly
Benzene	Grab	Quarterly
Toluene	Grab	Quarterly
Acute Lethality Test (Rainbow Trout and Daphnia magna)	Grab	Quarterly

(4) The methods and protocols for sampling, analysis, toxicity testing, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater Version 2.0" (January 2016), PIBS 2724e02, as amended from time to time by more recently published editions.
(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions, and
(c) the Environment Canada publications "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Rainbow Trout" (EPS 1/RM/13 Second Edition - December 2000)

and "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Daphnia magna" (EPS 1/RM/14 Second Edition - December 2000), as amended from time to time by more recently published editions.

(5) The measurement frequencies specified in subsections (2) and (3) in respect of any parameter are minimum requirements which may, after one (1) year of monitoring in accordance with this Condition, be modified by the District Manager in writing from time to time.

(6) The owner shall install and maintain (a) continuous flow measuring device(s) to measure the flow rate of the effluent discharged from the sewage works, with an accuracy to within plus or minus fifteen (15) per cent of the actual flow rate for the entire design range of the flow measuring device and record the flow rate at a daily frequency..

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

III - STORMWATER MANAGEMENT FACILITY

10. MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following stormwater monitoring program. Stormwater grab samples shall be collected from the Stormwater Management System **(SWMS) Pond** at a **quarterly frequency** (Spring, Summer, Fall, and Winter) and analysed for the following parameters:

Table 5 - Stormwater Monitoring
Sampling Point: **SWMS Pond**

General Parameters	Metals	Field Parameters
Alkalinity	Arsenic	Conductivity
Conductivity	Barium	Dissolved Oxygen
Hardness	Boron	pH
pH	Cadmium	Temperature
Chloride	Chromium	
Sulphate	Copper	
Nitrate as Nitrogen	Iron	
Nitrite as Nitrogen	Lead	
Total Ammonia as Nitrogen (TAN)	Mercury	
Total Suspended Solids	Zinc	
Total Dissolved Solids		
Chemical Oxygen Demand	**Organics**	
Total Phosphorus	Benzo(a)pyrene	
Total Kjeldahl Nitrogen	Ethylbenzene	
Biological Oxygen Demand (BOD5)	Naphthalene	
Phenols		

(2) The methods and protocols for sampling, analysis, toxicity testing, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater Version 2.0" (January 2016), PIBS 2724e02, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions.

11. OPERATION AND MAINTENANCE

(1) The stormwater run-off generated from the active waste fill area shall be considered contaminated and treated as leachate. The Owner shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system.

(2) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(3) The Owner shall prepare an operations manual within six (6) months of Substantial Completion of the Works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works.

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary for operational efficiency and environmental protection of the receiving body.

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works.

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager, and

(e) complaint procedures for receiving and responding to public complaints.

(4) The Owner shall maintain the operations manual current and retain a copy at the location of the Works or operational office of the Owner for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(5) The Owner shall undertake an inspection of the condition of the stormwater management ponds and ditches, at least once a year, and undertake any necessary cleaning and maintenance to prevent the

excessive build-up of sediment and/or decaying vegetation.

(6) The Owner shall undertake an inspection and necessary maintenance of the SWMS pond and associated erosion controls including temporary berms, silt fences, rocks and straw bale check dams at least once a year to ensure that the Works are effectively protecting the environment.

(7) The Owner shall maintain a logbook to record the results of the stormwater management pond inspections and any cleaning and maintenance operations undertaken and shall keep the logbook at the site or operational office of the Owner for inspection by the Ministry.

Stormwater Management System (SWMS)

(8) Before the commencement of operation of the Works, the Owner shall prepare a "Stormwater Contingency and Remedial Action Plan" for the Works and provide a copy to the District Manager.

(9) The Owner shall operate the Works in a **normally open position**. The Owner shall compare monitoring results obtained from the Works under Condition 10(1) with the trigger levels of the selected trigger parameters listed in Table 7 to identify any potential leachate impact to stormwater discharged from the ponds.

Table 7 - Trigger Parameters

Parameter	Trigger Level (mg/L)
Un-ionized Ammonia	0.02
Arsenic	0.005
Boron	1.5
pH (unitless)	6.5 to 8.5

(10) In the event that a monitoring result for any of the parameters listed in Table 7 exceeds its corresponding trigger level concentration, the Owner shall re-sample within two weeks period to confirm the trigger level concentration exceedance for that parameter.

(11) In the event that the trigger level concentration exceedance of any parameter of concern is not confirmed after the second round of sampling conducted under Condition 11(10), then, normal stormwater monitoring shall be resumed.

(12) In the event that the trigger level concentration exceedance of any parameter of concern is confirmed after the second round of sampling conducted under Condition 11(10), the Owner shall operate the Works in a **normally closed position** and notify the District Manager forthwith.

(13) While operating the Works in a **normally closed position**, the Owner shall implement the "Stormwater Contingency and Remedial Action Plan" prepared under Condition 11(8) and collect a grab sample and analyze for the trigger parameters listed under Condition 11(9) at a **weekly frequency** preferably after a rainfall event.

(14) The Owner shall resume operating the Works in a **normally open position** if monitoring results for all

trigger parameters from three (3) consecutive sampling events conducted under Condition 11(13) are less than their respective trigger level concentrations.

(15) Discharge of contaminated stormwater from the Works to storm sewer/surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

IV - GENERAL

12. REPORTING

(1) One week prior to the start up of the operation of the works, the Owner shall notify the District Manager (in writing) of the pending start up date.

(2) The Owner shall report to the District Manager or designate, any exceedance of any parameter specified in Condition 6 orally, as soon as reasonably possible, and in writing within seven (7) days of the exceedance.

(3) In addition to the obligations under Part X of the Environmental Protection Act, the Owner shall, within ten (10) working days of the occurrence of any reportable spill as defined on Ontario Regulation 675/98, bypass or loss of any product, by-product, intermediate product, oil, solvent, waste material or any other polluting substance into the environment, submit a full written report of the occurrence to the District Manager describing the cause and discovery of the spill or loss, clean-up and recovery measures taken, preventative measures to be taken and schedule of implementation.

(4) The Owner shall prepare and submit a performance report to the District Manager on an annual basis by April 30th. The first such report shall cover the first annual period following the commencement of operation of the works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a summary and interpretation of all monitoring data and a comparison to the effluent limits outlined in Condition 6, including an overview of the success and adequacy of the sewage works.

(b) a description of any operating problems encountered and corrective actions taken.

(c) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the sewage works.

(d) a summary of any effluent quality assurance or control measures undertaken in the reporting period.

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment, and

(f) a description of efforts made and results achieved in meeting the effluent objectives outlined in Condition 5.

13. LIMITED OPERATIONAL FLEXIBILITY

(1) The Owner may make modifications to the Works in accordance with the Terms and Conditions of this Approval and subject to the Ministry's "Limited Operational Flexibility Criteria for Modifications to Sewage Works", included under Schedule B of this Approval, as amended.

(2) Sewage works under Limited Operational Flexibility shall adhere to the design guidelines contained within the Ministry's publication "Design Guidelines for Sewage Works 2008", as amended.

(3) The Owner shall ensure at all times, that the Works, related equipment and appurtenances which are installed or used to achieve compliance are operated in accordance with all Terms and Conditions of this Approval.

(4) For greater certainty, the following are not permitted as part of Limited Operational Flexibility:

(a) Modifications to the Works that result in an increase of the approved Rated Capacity of the Works.

(b) Modifications to the Works that may adversely affect the approved effluent quality criteria or the location of the discharge/outfall.

(c) Modifications to the treatment process technology of the Works, or modifications that involve construction of new reactors (tanks) or alter the treatment train process design.

(d) Modifications to the Works approved under s.9 of the EPA, and

(e) Modifications to the Works pursuant to an order issued by the Ministry.

(5) Implementation of Limited Operational Flexibility is not intended to be used for piecemeal measures that result in major alterations or expansions.

(6) If the implementation of Limited Operational Flexibility requires changes to be made to the Emergency Response, Spill Reporting and Contingency Plan, the Owner shall, provide a revised copy of this plan for approval to the local fire services authority prior to implementing Limited Operational Flexibility.

(7) For greater certainty, any modification made under the Limited Operational Flexibility may only be carried out after other legal obligations have been complied with, including those arising from the *Environmental Protection Act, Niagara Escarpment Planning and Development Act, Oak Ridges Moraine Conservation Act, Lake Simcoe Protection Act* and *Greenbelt Act.*

(8) At least thirty (30) days prior to implementing Limited Operational Flexibility, the Owner shall complete a Notice of Modifications describing any proposed modifications to the Works and submit it to the District Manager.

(9) The Owner shall not proceed with implementation of Limited Operational Flexibility until the District Manager has provided written acceptance of the Notice of Modifications or a minimum of thirty (30) days have passed since the day the District Manager acknowledged the receipt of the Notice of Modifications.

Schedule A

1. Application for Approval of Industrial Sewage Works submitted by Mr. Richard Weldon, Managing Partner, 2270386 Ontario Inc., dated September 9, 2019 and supporting information prepared by GHD Consulting Engineers.

2. Letter from GHD to Mr. Paul Widmeyer, Ministry of Environment, Conservation and Parks, Re: Permanent Stormwater Management System ECA No. 4142-ASEKJ2 dated September 17, 2019.

3. Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated September 11, 2013 and design specifications and drawings Prepared by Conestoga-Rovers & Associates Ltd., Waterloo, Ontario.

4. Letter from Peter Kemp, B. Eng., Conestoga-Rovers & Associates Ltd., to Stefanos Habtom, P. Eng., dated May 31, 2014 in response to an additional information request dated April 10, 2014.
5. Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated May 15, 2015 and design specifications and drawings for the leachate treatment system prepared by KOESTER CANADA, Brantford, Ontario.

6. Revised Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated December 15, 2017 but received on January 8, 2018 and revised design specifications and drawings for the leachate treatment system prepared by KOESTER CANADA, Brantford, Ontario.

Schedule B

Limited Operational Flexibility Criteria for Modifications to Industrial Sewage Works

1. The modifications to sewage works approved under an Environmental Compliance Approval (Approval) that are permitted under the Limited Operational Flexibility (LOF), are outlined below and are subject to the LOF conditions in the Approval, and require the submission of the Notice of Modifications. If there is a conflict between the sewage works listed below and the Terms and Conditions in the Approval, the Terms and Conditions in the Approval shall take precedence.

1.1 Sewage Pumping Stations

a. Alter pumping capacity by adding or replacing equipment where new equipment is located within an existing sewage treatment plant site or an existing sewage pumping station site, provided that the modifications do not result in an increase of the sewage treatment plant Rated Capacity and the existing flow process and/or treatment train are maintained, as applicable.

1.2 Sewage Treatment Process

a. Installing additional chemical dosage equipment including replacing with alternative chemicals for pH adjustment or coagulants (non-toxic polymers) provided that there are no modifications of treatment processes or other modifications that may alter the intent of operations and may have negative impacts on the effluent quantity and quality.

b. Expanding the buffer zone between a sanitary sewage lagoon facility or land treatment area and adjacent uses provided that the buffer zone is entirely on the proponent's land.

c. Optimizing existing sanitary sewage lagoons with the purpose to increase efficiency of treatment operations provided that existing sewage treatment plant rated capacity is not exceeded and where no land acquisition is required.

d. Optimizing existing sewage treatment plant equipment with the purpose to increase the efficiency of the existing treatment operations, provided that there are no modifications to the works that result in an increase of the Rated Capacity, and may have adverse effects to the effluent quality or location of the discharge.

e. Replacement, refurbishment of previously approved equipment in whole or in part with Equivalent Equipment, like-for-like of different make and model, provided that the firm capacity, reliability, performance standard, level of quality and redundancy of the group of equipment is kept the same. For clarity purposes, the following equipment can be considered under this provision: screens, grit separators, blowers, aeration equipment, sludge thickeners, dewatering equipment, UV systems, chlorine contact equipment, bio-disks, and sludge digester systems.

1.3 Sewage Treatment Plant Outfall

a. Replacement of discharge pipe with similar pipe size provided that the outfall location is not changed.

1.4 Sanitary Sewers

a. Pipe relining and replacement with similar pipe size within the Sewage Treatment Plant site, where the nominal diameter is not greater than 1,200 mm.

1.5 Pilot Systems

a. Installation of pilot systems for new or existing technologies provided that:

i. any effluent from the pilot system is discharged to the inlet of the sewage treatment plant or hauled off-site for proper disposal,
ii. any effluent from the pilot system discharged to the inlet of the sewage treatment plant or sewage conveyance system does not significantly alter the composition/concentration of the influent sewage to be treated in the downstream process; and that it does not add any inhibiting substances to the downstream process, and
iii. the pilot system's duration does not exceed a maximum of two years; and a report with results is submitted to the Director and District Manager three months after completion of the pilot project.

2. Sewage works that are exempt from section 53 of the OWRA by O. Reg. 525/98 continue to be exempt and are not required to follow the notification process under this Limited Operational Flexibility.

3. Normal or emergency operational modifications, such as repairs, reconstructions, or other improvements that are part of maintenance activities, including cleaning, renovations to existing approved sewage works equipment, provided that the modification is made with Equivalent Equipment, are considered pre-approved.

4. The modifications noted in section (3) above are <u>not</u> required to follow the notification protocols under Limited Operational Flexibility, provided that the number of pieces and description of the equipment as described in the Approval does not change.

Ontario
Ministry of
the Environment

Notice of Modification to Sewage Works

RETAIN COPY OF COMPLETED FORM AS PART OF THE ECA AND SEND A COPY TO THE WATER SUPERVISOR (FOR MUNICIPAL) OR DISTRICT MANAGER (FOR NON-MUNICIPAL SYSTEMS)

Part 1 – Environmental Compliance Approval (ECA) with Limited Operational Flexibility

(Insert the ECA's owner, number, issuance date and notice number, which should start with "01" and consecutive numbers thereafter)

ECA Number	Issuance Date (mm/dd/yy)	Notice number (if applicable)

ECA Owner	Municipality

Part 2: Description of the modifications as part of the Limited Operational Flexibility

(Attach a detailed description of the sewage works)

Description shall include:
1. A detail description of the modifications and/or operations to the sewage works (e.g. sewage work component, location, size, equipment type/model, material, process name, etc.)
2. Confirmation that the anticipated environmental effects are negligible.
3. List of updated versions of, or amendments to, all relevant technical documents that are affected by the modifications as applicable, i.e. submission of documentation is not required, but the listing of updated documents is (design brief, drawings, emergency plan, etc.)

Part 3 – Declaration by Professional Engineer

I hereby declare that I have verified the scope and technical aspects of this modification and confirm that the design:
1. Has been prepared or reviewed by a Professional Engineer who is licensed to practice in the Province of Ontario;
2. Conforms with the Limited Operational Flexibility as per the ECA;
3. Has been designed consistent with Ministry's Design Guidelines, adhering to engineering standards, industry's best management practices, and demonstrating ongoing compliance with s.53 of the Ontario Water Resources Act; and other appropriate regulations.

I hereby declare that to the best of my knowledge, information and belief the information contained in this form is complete and accurate.

Name of Employer

Part 4 – Declaration by Owner

I hereby declare that:
1. I am authorized by the Owner to complete this Declaration;
2. The Owner consents to the modification; and
3. These modifications to the sewage works are proposed in accordance with the Limited Operational Flexibility as described in the ECA.
4. The Owner has fulfilled all applicable requirements of the *Environmental Assessment Act*.

I hereby declare that to the best of my knowledge, information and belief the information contained in this form is complete and accurate.

Owner Representative's Signature	Date (mm/dd/yy)

Notice of Modifications Dec-2013.pdf

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved works and to ensure that subsequent Owners of the works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is imposed to ensure consistency between approvals granted by the Ministry.

4. Conditions 4 and 11 are included to ensure that a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the Owner and made available to the Ministry. Such a manual is an integral part of the operation of the works. Its compilation and use should assist the owner in staff training, in proper plant operation and in identifying and planning for contingencies during possible abnormal conditions. The manual will also act as a benchmark for Ministry staff when reviewing the owner's operation of the works.

5. Condition 5 is imposed to establish non-enforceable effluent quality objectives which the Owner is obligated to use best efforts to strive towards on an ongoing basis. These objectives are to be used as a mechanism to trigger corrective action proactively and voluntarily before environmental impairment occurs and before the compliance limits of Condition 5 are exceeded.

6. Conditions 6 and 7 are imposed to ensure that the effluent discharged from the Works to the Brooks Road side ditch meets the Ministry's effluent quality requirements thus minimizing environmental impact on the receiver.

7. Condition 8 is included to ensure that treatment capacity for the leachate treatment system is established based on proper receiving surface water assimilative capacity assessment and effluent limits requirements.

8. Conditions 9 and 10 are included to require the Owner to demonstrate on a continual basis that the quality and quantity of the effluent from the approved Works is consistent with the (design objectives and) effluent limits specified in the Approval and that the approved works does not cause any impairment to the receiving watercourse.

9. Condition 12 is included to provide a performance record for future references and to ensure that the Ministry is made aware of problems as they arise, so that the Ministry can work with the Owner in resolving the problems in a timely manner.

10. Condition 13 is included to ensure that the Works are operated in accordance with the application and supporting documentation submitted by the Owner, and not in a manner which the Director has not been asked to consider. These Conditions are also included to ensure that a Professional Engineer has reviewed the proposed modifications and attests that the modifications are in line with that of Limited Operational Flexibility, and provide assurance that the proposed modifications comply with the Ministry's requirements stipulated in the Terms and Conditions of this Approval, Ministry policies, guidelines, and industry engineering standards and best management practices.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 4142-ASEKJ2 issued on January 29, 2018.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario

Notice of Modifications Dec-2013.pdf

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL
NUMBER A110302
Issue Date: March 27, 2020

2270386 Ontario Limited
162 Cumberland St
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd
Lot 24, Concession 1 NORTH
Haldimand County

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

a waste disposal site (landfill) with a total site area of 14.3 hectares of which 6 hectares is approved for landfilling.

For the purpose of this environmental compliance approval, the following definitions apply:

"Approval" or "ECA" means this Environmental Compliance Approval and any Schedules to it, including the application and supporting documentation listed in Schedule "A";

"Contaminating Life Span" means contaminating life span as defined in Ontario Regulation 232/98;

"Design and Operations Report" means the Design and Operations Report Vertical Expansion, Brooks Road Landfill Site, Prepared by GHD, April 18, 2019 that was submitted in support of the Approval

"Director" means any Ministry employee appointed in writing by the Minister pursuant to section 5 of the EPA as a Director for the purposes of Part II.1 of the EPA;

"District Manager" means the District Manager of the local district office of the Ministry in which the Site is geographically located;

"EPA" means Environmental Protection Act, R.S.O. 1990, c. E. 19, as amended;

"Improvement Area" means the area of Brooks Road, between Highway #3 (also known as Talbot Road) and Townline Road;

“Ministry” means the Ontario Ministry of the Environment, Conservation and Parks;

"NMA" means Nutrient Management Act, 2002, S.O. 2002, c. 4, as amended;

"Odour Management Plan" means a document which describes the measures to minimize odour emissions from the Site;

"Operator” means any person, other than the Owner's employees, authorized by the Owner as having the charge, management or control of any aspect of the Site and includes its successors or assigns;

"Owner" means any person that is responsible for the establishment or operation of the Site being approved by this Approval, and includes 2270386 Ontario Limited and its successors and assigns;

“OWRA” means the Ontario Water Resources Act, R.S.O. 1990, c. O.40, as amended;

“PA” means the Pesticides Act, R.S.O. 1990, c. P-11, as amended;

"Provincial Officer" means any person designated in writing by the Minister as a provincial officer pursuant to Section 5 of the OWRA, Section 5 of the EPA, Section 17 of the PA, Section 4 of the NMA, or Section 8 of the SDWA;

"Refrigerant Appliances" means household appliances which use, or may use refrigerants, and which include, but is not restricted to, refrigerators, freezers and air-conditioning systems;

"Regional Director" means the Regional Director of the local Regional Office of the Ministry in which the Site is located;

"Regulation 232" means Ontario Regulation 232/98 - Landfilling Sites made under the EPA, as amended;

"Regulation 347" or "Reg. 347" means means Regulation 347, R.R.O. 1990, General - Waste Management, made under the EPA, as amended;

"Regulation 406" means means Regulation 406/19, R.S.O. 1990, On-site and Excess Soil Management, made under the EPA, as amended;

"Regulation 558" means Ontario Regulation 558/00 - General Waste Management, made under the EPA, as amended;

"Regulation 903" means Regulation 903 - Wells, R.R.O. 1990, made under the OWRA, as amended;

"SDWA" means Safe Drinking Water Act, 2002, S.O. 2002, c. 32, as amended;

“Site" means the entire waste disposal site, including the buffer lands, at the Brooks Road Landfill Site, Lot 24, Concession 1 North, Haldimand County; and

“Trained Personnel” means personnel knowledgeable in the following through instruction and/or practice:

a. relevant waste management legislation, regulations and guidelines;
b. major environmental concerns pertaining to the waste to be handled;
c. occupational health and safety concerns pertaining to the processes and wastes to be handled;
d. management procedures including the use and operation of equipment for the processes and wastes to be handled;
e. emergency response procedures;
f. specific written procedures for the control of nuisance conditions;
g. specific written procedures for refusal of unacceptable waste loads; and
h. the requirements of this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. GENERAL

Compliance

(1) This Approval revokes all previous Approvals and Notices of Amendment issued under Part V of the Environmental Protection Act for this Site. The approval given herein, including the terms and conditions set out, replaces all previously issued Approvals and related terms and conditions under Part V of the Act for this Site.

(2) The Owner and Operator shall ensure compliance with all the conditions of this Approval and shall ensure that any person authorized to carry out work on or operate any aspect of the Site is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(3) Any person authorized to carry out work on or operate any aspect of the Site shall comply with the conditions of this Approval.

In Accordance

(4) Except as otherwise provided by this Approval, the Site shall be designed, developed, built, operated and maintained in accordance with the documentation listed in the attached Schedule “A”.

(5) 1. Construction and installation of aspects described in Schedule "A" must be completed within 5 years of the later of:

(a) the date this Approval is issued; or

(b) if there is a hearing or other litigation in respect of the issuance of this Approval, the date that this hearing or litigation is disposed of, including all appeals.

2. This Approval ceases to apply in respect of the aspects of the Site noted above that have not been constructed or installed before the later of the dates identified in Condition 1(5)1.

Interpretation

(6) Where there is a conflict between a provision of any document listed in Schedule "A" in this Approval, and the conditions of this Approval, the conditions in this Approval shall take precedence.

(7) Where there is a conflict between the application and a provision in any document listed in Schedule "A", the application shall take precedence, unless it is clear that the purpose of the document was to amend the application and the Ministry approved the amendment.

(8) Where there is a conflict between any two documents listed in Schedule "A", the document bearing the most recent date shall take precedence.

(9) The conditions of this Approval are severable. If any condition of this Approval, or the application of any condition of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

Other Legal Obligations

(10) The issuance of, and compliance with, this Approval does not:
(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement; and
(b) limit in any way the authority of the Ministry to require certain steps be taken or to require the Owner and Operator to furnish any further information related to compliance with this Approval.

Adverse Effect

(11) The Owner and Operator shall take steps to minimize and ameliorate any adverse effect on the natural environment or impairment of water quality resulting from the present, past and historical operations at the Site. Such steps may include accelerated or additional monitoring as may be necessary to determine the nature and extent of the effect or impairment.

(12) Despite an Owner, Operator, or any other person fulfilling any obligations imposed by this Approval, the person remains responsible for any contravention of any other condition of this Approval or any applicable statute, regulation, or other legal requirement resulting from any act or omission that caused the adverse effect to the natural environment or impairment of water quality.

(13) At no time shall the Owner or Operator allow the discharge of a contaminant that causes or is likely to

cause an adverse effect.

Change of Ownership

(14) The Owner shall notify the Director, in writing, and forward a copy of the notification to the District Manager, within 30 days of the occurrence of any changes in the following information:
(a) the ownership of the Site;
(b) the Operator of the Site;
(c) the address of the Owner or Operator; and
(d) the partners, where the Owner or Operator is or at any time becomes a partnership and a copy of the most recent declaration filed under the Business Names Act, R. S. O. 1990, c. B.17, shall be included in the notification.

(15) No portion of this Site shall be transferred or encumbered prior to or after closing of the Site unless the Director is notified in advance and sufficient financial assurance is deposited with the Ministry to ensure that these conditions will be carried out.

(16) In the event of any change in ownership of the Site, other than change to a successor municipality, the Owner shall notify the successor of and provide the successor with a copy of this Approval, and the Owner shall provide a copy of the notification to the District Manager and the Director.

Registration on Title Requirement

(17) Prior to dealing with the property in any way, the Owner shall provide a copy of this Approval and any amendments, to any person who acquires an interest in the property as a result of the dealing.

(18) (a) If not already completed, within ninety (90) calendar days from the date of issuance of this Approval, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:
(i) a plan of survey prepared, signed and sealed by an Ontario Land Surveyor, which shows the area of the Site where waste has been and is to be deposited at the Site;
(ii) proof of ownership of the Site;
(iii) a letter signed by a member of the Law Society of Upper Canada or other qualified legal practitioner acceptable to the Director, verifying the legal description provided in the Certificate of Requirement;
(iv) the legal abstract of the property; and
(v) any supporting documents including a registerable description of the Site.

(b) If not already completed, within fifteen (15) calendar days of receiving a Certificate of Requirement authorized by the Director, the Owner shall:
(i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and
(ii) submit to the Director and the District Manager, written verification that the Certificate of Requirement has been registered on title.

Registration on Title Requirement - Contaminant Attenuation Zone (CAZ)

(19) Within thirty (30) calendar days from the date of establishing a contaminant attenuation zone (CAZ) (overburden and/or bedrock aquifers) in either fee simple or by way of a groundwater easement, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:

(a) If rights are obtained in fee simple, the Owner shall provide:
  (i) documentation evidencing ownership of the CAZ obtained in compliance with Regulation 232, as amended;
  (ii) a completed Certificate of Requirement and supporting documents containing a registerable description of the CAZ; and
  (iii) a letter signed by a member of the Law Society of Upper Canada; or other qualified legal practitioner acceptable to the Director, verifying the legal description of the CAZ.

(b) within fifteen (15) calendar days of receiving a Certificate of Requirement signed or authorized by the Director,the Owner shall:
  (i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and
  (ii) submit to the Director and the District Manager, a written verification that the Certificate of Requirement has been registered on title.

(c) If rights are obtained by way of a groundwater easement, the Applicant shall:
  (i) provide a copy of the agreement for the easement;
  (ii) provide a plan of survey signed and sealed by an Ontario Land Surveyor for the CAZ; and
  (iii) submit proof of registration on title of the groundwater easement to the Director and District Manager;

(d) The Owner shall not amend, or remove, or consent to the removal of the easement or CAZ from title without the prior written consent of the Director.

Inspections by the Ministry

(20) No person shall hinder or obstruct a Provincial Officer from carrying out any and all inspections authorized by the OWRA, the EPA, the PA, the SDWA or the NMA, of any place to which this Approval relates, and without limiting the foregoing:
(a) to enter upon the premises where the approved works are located, or the location where the records required by the conditions of this Approval are kept;
(b) to have access to, inspect, and copy any records required to be kept by the conditions of this Approval;
(c) to inspect the Site, related equipment and appurtenances;
(d) to inspect the practices, procedures, or operations required by the conditions of this Approval; and
(e) to sample and monitor for the purposes of assessing compliance with the terms and conditions of this Approval or the EPA, the OWRA, the PA, the SDWA or the NMA.

Information and Record Retention

(21) (a) Except as authorized in writing by the Director, all records required by this Approval shall be retained at the Site for a minimum of two (2) years from their date of creation.

(b) The Owner shall retain all documentation listed in Schedule "A" for as long as this Approval is valid.
(c) All information and logs required in Conditions 9(1), 10(1), 11(3), 11(4), 12(3), and 12(4) shall be kept at the Site until they are included in the Annual Report.
(d) The Owner shall retain employee training records as long as the employee is working at the Site.
(e) The Owner shall make all of the above documents available for inspection upon request of Ministry staff.

(22) The receipt of any information by the Ministry or the failure of the Ministry to prosecute any person or to require any person to take any action under this Approval or under any statute, regulation or other legal requirement, in relation to the information, shall not be construed as:
(a) an approval, waiver, or justification by the Ministry of any act or omission of any person that contravenes any term or condition of this Approval or any statute, regulation or other legal requirement; or
(b) acceptance by the Ministry of the information's completeness or accuracy.

(23) The Owner shall ensure that a copy of this Approval, in its entirety and including all its Notices of Amendment, and documentation listed in Schedule "A", are retained at the Site at all times.

(24) Any information related to this Approval and contained in Ministry files may be made available to the public in accordance with the provisions of the Freedom of Information and Protection of Privacy Act, RSO 1990, CF-31.

2. FINANCIAL ASSURANCE

(1) (a) Within twenty (20) days of issuance of this Notice, the Owner shall submit to the Director, Financial Assurance as defined in Section 131 of the Environmental Protection Act, in the amount of **$8,371,282.00.** This Financial Assurance shall provide sufficient funds for the closure and post-closure care/monitoring of the Site.

(i) The total amount of financial assurance specified in Condition 2(1)(a) shall be updated by the *Owner,* as follows, by the specified dates:

i. October 1, 2021 - **$9,956,333.00**
ii. October 1, 2022 - **$11,541,383.00**
iii. October 1, 2023 - **$10,424,285.00**
iv. October 1, 2024 - **$10,097,075.00**

(b) Commencing on October 1, 2023 and on a three (3) year basis thereafter, the Owner shall provide to the Director a re-evaluation of the amount of the Financial Assurance to facilitate the actions required under Condition 2(1)(a). The re-evaluation shall include an assessment based on any new information relating to the environmental conditions of the Site and shall include the costs of additional monitoring and/or implementation of alternative measures required by the Director upon review of the annual reports. The Financial Assurance must be submitted to the Director within twenty (20) days of written acceptance of the re-evaluation by the Director;

(c) The amount of Financial Assurance is subject to review at any time by the Director and may be amended at his/her discretion. If any Financial Assurance is scheduled to expire or notice is received, indicating Financial Assurance will not be renewed, and satisfactory methods have not been made to replace the Financial Assurance at least sixty (60) days before the Financial Assurance terminates, the Owner shall forthwith replace the Financial Assurance with cash.

3. SITE OPERATION

Operation

(1) The Site shall be operated and maintained at all times including management and disposal of all waste, in accordance with the EPA, Regulation 347, Regulation 232, and the conditions of this Approval.

Service Area

(2) Waste categories of Industrial, Commercial and Institutional ("ICI waste"), generated from within the geographic boundaries of the Province of Ontario may be received for disposal at this Site.

Waste Types

(3) Only solid non-hazardous ICI waste, including contaminated soils, and processed organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant), shall be received for disposal at this Site. No hazardous waste or liquid industrial waste**,** as defined in Reg. 347, as amended by Reg. 558/00, shall be disposed at this Site.

(4) The Owner shall develop and implement a program to inspect waste to ensure that the waste received at the Site is of a type approved for acceptance under this Approval.

(5) The Owner shall ensure that all loads of waste are properly inspected by Trained Personnel prior to acceptance at the Site and that the waste vehicles are directed to the appropriate areas for disposal or transfer of the waste. The Owner shall notify the District Manager, in writing, of load rejections at the Site within one (1) business day from their occurrence.

Approved Waste Quantities

(6) The maximum volumetric capacity for the Site including waste and daily cover shall not exceed 1,045,065 cubic metres.

(7) The Owner shall ensure that the waste received at the Site does not exceed:
(a) a total of 151,000 tonnes in any calendar year; and
(b) the daily maximum received at the site does not exceed 1,000 tonnes.

Waste Placement

(8) No waste shall be landfilled outside of the approved six (6) hectare footprint fill area. The site shall be developed, maintain established buffer areas, and adhere to final contours for waste and final cover material in accordance with the design drawings provided in Appendix L of the Design and Operations Report.

(a) The maximum elevation of the fill zone, including final cover, shall be 221.50 metres above mean sea level.

Signage

(9) A sign shall be installed and maintained at the main entrance/exit to the Site on which is legibly displayed the following information:

(a) the name of the Site and Owner;
(b) the number of the Approval;
(c) the name of the Operator;
(d) the normal hours of operation;
(e) the allowable and prohibited waste types;
(f) the telephone number to which complaints may be directed;
(g) a warning against unauthorized access;
(h) a twenty-four (24) hour emergency telephone number (if different from above); and
(i) a warning against dumping outside the Site.

(10) All landfill signs shall be kept legible, in good repair, and cleaned when required.

Nuisance Control (Vermin, Vectors, Dust, Litter, Odour, Noise and Traffic)

(11) The Site shall be operated and maintained such that vermin, vectors, dust, litter, odour, noise and traffic do not create a nuisance.

(12) The Owner/Operator shall install visual screening berms, in accordance with the Design and Operations Report and shall inspect and maintain them as required, during the operating life of the landfill Site.

(13) The Owner/Operator shall conduct inspections and ensure that appropriate controls are in place to prevent the acceptance of liquid industrial waste and hazardous waste and to prevent the acceptance of waste from outside the approved service area. Records of violations by haulers or waste generators shall be maintained in the daily records for the Site operations. The Owner/Operator shall ensure that any waste refused for disposal leaves the Site immediately, and the District Manager is notified forthwith, of all waste load refusals at the Site related to requirements in this Certificate, including service area and waste types.

(14) The Owner/Operator shall ensure that the leachate collection system piping in the fill area and the connecting forcemain piping which leads to the leachate holding tank, shall be cleaned out at least once per year with a high pressure wash, and video inspections conducted, as necessary, to confirm that the pipes are clean and to determine the need for more frequent cleaning. Assessment of the need to amend the cleaning frequency shall be based on regular inspections of the leachate collection system and monitoring results.

(15) A thickness of at least 5 metres of compacted waste and cover material shall be maintained between any landfilled sludge (solid non-hazardous as per Reg. 347) and the granular leachate collection layer and leachate monitoring wells.

(16) The Owner/Operator shall take all reasonable steps to prevent off-site nuisance impacts, including visual impacts, transfer of waste, mud, or dust from the Site onto public roads due to landfill operations.

Burning of Waste

(17) Burning of waste at the Site is prohibited.

Scavenging

(18) Scavenging (as defined in Reg. 347) of deposited and/or stockpiled waste is prohibited at the Site. Controlled removal of recycleable/reusable material from the Site may only occur in a designated paved area on the Site, and shall be supervised by Trained Personnel.

Hours of Operation

(19) The permitted hours of operation for the site are from 6:00 a.m. to 6:00 p.m., Monday to Friday, and from 6:00 a.m. to 2:00 p.m. on Saturdays, for site preparation, site maintenance and daily cover activities. The operating hours for receipt of waste for disposal at the Site shall be from 7:00 a.m. to 5:00 p.m., Monday to Friday, and from 7:00 a.m. to 1:00 p.m., on Saturdays. No operations shall take place at the Site outside of the stated hours and the Site shall be closed on statutory holidays.

(20) The hours of operation may be amended from time to time to accommodate seasonal or unusual demand, based on prior consultation with the PLC and written concurrence from the District Manager.

Site Security

(21) No waste shall be received, landfilled or removed from the Site unless a site supervisor or other Trained Personnel are present to supervise the operations during operating hours. The Site shall be closed when a supervisor or Trained Personnel are not present to supervise operations at the Site.

(22) The Site shall be operated and maintained in a safe and secure manner. During non-operating hours, the Site entrance and exit gates shall be locked and the Site shall be secured against access by unauthorized persons.

Cover Material

(23) Alternative materials to soil may be used as weekly and interim cover material, based on an application with supporting information and applicable fee for a trial use or permanent use, submitted by the Owner to the Director, copied to the District Manager and as approved by the Director via an amendment to this Approval. The alternative material shall be non-hazardous according to Regulation 347 and will be expected to perform at least as well as soil in relation to the following functions:

(a) control of blowing litter, odours, dust, landfill gas, gulls, vectors, vermin and fires;
(b) provision for an aesthetic condition of the landfill during the active life of the Site;
(c) provision for vehicle access to the active tipping face; and
(d) compatibility with the design of the Site for groundwater protection, leachate management and landfill gas management.

(24) Daily, interim and final cover material shall be shall be applied as follows:

a. Daily Cover - At the end of each working day, the entire working face shall be compacted and covered with a minimum thickness of 150 mm of soil cover, compost, wood chips, or other approved daily cover material. Prior to placing waste at the start of the next operating day, the existing daily cover material shall be scarified or removed to the extent practical, to ensure vertical hydraulic connection is maintained between layers of waste and to promote percolation of leachate downwards to the leachate collection system.
b. Interim Cover - In areas where landfilling ceases temporarily for a period of 6 months or more, a minimum thickness of 300 mm of soil shall be placed as interim cover and graded to promote surface water runoff. The quality of soil for use as interim cover shall, as a minimum, meet the standards specified in Table 3 of Soil, Groundwater and Sediment Standards for use under Part XV.1 of the Environmental Protection Act. Prior to the use of interim cover soil, representative samples shall be taken and analysed for metals, Volatile Organic Compounds (VOCs) and PAHs, to confirm the soil meets the above-mentioned standards.
c. Final Cover - Final cover shall be applied progressively as areas of the landfill reach final waste elevations within the fill area. Prior to placement of final cover, the Owner/Operator shall submit for the approval of the Director, a report detailing the specifications, including particle size distribution of the final cover soil which shall confirm the designed infiltration rate of 0.15 m/year, as well as the protocols for testing and acceptance for on-site and off-site final cover soils. All areas of final cover shall be graded and vegetated as soon as practically possible. The final soil cap shall be regularly inspected and maintained after the installation and during the post-closure period. Without limiting the above, the Owner/Operator shall ensure for a minimum of five years after completion of the cap that the Site shall be inspected at least on a quarterly basis to ensure that there is positive drainage along the cap and that during the frost free period of the first two years following completion, such inspections shall be monthly. If any inspection indicates that there is an area of ponding or zero slope, the Owner/Operator shall take all steps necessary to provide positive drainage and rehabilitate the final cover as soon as practically possible.
d. All on-site and excess soil used for daily, interim, and final cover shall be managed in accordance with Regulation 406.

Traffic Control

(25) The Owner/Operator shall ensure that vehicles carrying waste or materials to and from the Site shall only enter the Site from Highway #3 and Brooks Road. At no time shall any vehicle carrying waste or materials to and from the Site travel along Townline Road to access the Site.

(26) The Owner/Operator shall be responsible for maintenance and remedial work to the Improvement Area.

The Improvement Area shall be maintained to the following minimum requirements:

(a) 300 mm thick granular "A" layer of gravel, meeting all applicable Haldimand County and Ontario Provincial Standards Specification (OPSS) to the Improvement Area; and

(b) Maintain asphalt on the entranceway/exit to the landfill and the parking area for the landfill Site, as well as 30 metres of the road approach on Brooks Road to the entranceway/exit to the Site, extending both north and south of the entranceway/exit, in base asphalt and top coat. The thickness of asphalt shall be a base coarse of 60 mm (HL8), and a surface coarse of 50 mm (HL3).

Odour Management

(27) Within ninety (90) days from the issuance of this Approval, the Owner shall submit to the District Manager for approval, an Odour Management Plan that includes mitigation measures to minimize off-Site odour impacts, and if appropriate, a trigger mechanism and contingency plan.

(28) The Odour Management Plan shall be reviewed on an annual basis as part of the Annual Report.

(29) If there is any odour complaint, or significant odour is detected during daily inspection, and the odour is confirmed to originate from the Site, mitigation measures shall be implemented immediately in accordance with the Odour Management Plan approved by the District Manager.

(30) If odour causes adverse off-site impacts that are not mitigated through implementation of odour mitigation measures according to the Odour Management Plan, the Owner shall, upon written notification from the District Manager, conduct an investigation into the cause as to why the impacts were not mitigated and submit to the District Manager within the time frame identified in the notice, an assessment of the issues and the need for implementation of contingency actions in accordance with the Odour Management Plan.

(31) If the Ministry deems the odour mitigation measures taken as per Condition 3(29) to be unsuitable, insufficient or ineffective, the District Manager may direct the Owner, in writing, to propose further measures to address the noted failure, upset or malfunction, which may include requiring a reduction in the receipt of waste, cessation of the receipt of waste, removal and disposal of waste from the waste diversion area, the removal of leachate from the Site in accordance with Condition 5(5), as well as, making repairs or modifications to equipment or processes. Such measures shall be implemented by the Owner upon approval by the District Manager.

(32) If the cessation of the receipt of waste is required, as determined by Condition 3(31), no waste shall be received at the Site until the District Manager is satisfied that odour impacts have been adequately mitigated.

4. GROUNDWATER AND SURFACE WATER MONITORING

Compliance

(1) The Site shall be operated in such a way as to ensure compliance with the following:

(a) Reasonable Use Guideline B-7 for the protection of the groundwater at the Site; and

(b) Provincial Water Quality Objectives included in the July 1994 publication entitled *Water Management Policies, Guidelines, Provincial Water Quality Objectives,* as amended from time to time, or limits set by the Regional Director, or the *Canadian Water Quality Guidelines* published by the Canadian Council of Ministers of the Environment, 1999 for the protection of the surface water at and off the Site.

Surface Water and Groundwater

(2) The Owner shall monitor surface water and groundwater in accordance with the environmental monitoring program outlined in Schedule "B".

(3) A certified Professional Geoscientist or Engineer possessing appropriate hydrogeologic and hydrologic training and experience shall execute or directly supervise the execution of the environmental monitoring and reporting program.

Groundwater Wells and Monitors

(4) The Owner shall ensure that all groundwater monitoring wells which form part of the monitoring program are properly capped, locked and protected from damage and maintained in accordance with Regulation 903.

(5) Where landfilling is to proceed around monitoring wells, suitable extensions shall be added to the wells and the wells shall be properly re-secured.

(6) Any groundwater monitoring well included in the on-going monitoring program that is damaged shall be assessed, repaired, replaced or decommissioned by the Owner, as required.

(a) The Owner shall repair or replace any monitoring well which is destroyed or in any way made to be inoperable for sampling such that no more than one regular sampling event is missed.

(b) All monitoring wells which are no longer required as part of the groundwater monitoring program, and have been approved by the Director or the District Manager for abandonment, shall be decommissioned by the Owner, as required, in accordance with Regulation 903, to prevent contamination through the abandoned well. A report on the decommissioning of the well shall be included in the Annual Report for the period during which the well was decommissioned.

Trigger Mechanisms and Contingency Plans

(7) In the event of a confirmed exceedance of a site-specific trigger level relating to groundwater or surface water impacts due to leachate, the Owner shall immediately notify the District Manager, and an investigation into the cause and the need for implementation of remedial or contingency actions shall be

carried out by the Owner in accordance with the approved trigger mechanisms and associated contingency plans provided in Appendix J of the Design and Operations Report.

(8) If monitoring results, investigative activities and/or trigger mechanisms indicate the need to implement contingency measures, the Owner shall ensure that the following steps are taken:

(a) the Owner shall notify the District Manager, in writing of the need to implement contingency measures, no later than seven (7) days after confirmation of the exceedances;
(b) within thirty (30) days from the date of confirming the need to implement contingency measures, detailed plans, specifications and descriptions for the design, operation and maintenance of the contingency measures shall be prepared and submitted by the Owner to the Director for approval; and
(c) the contingency measures shall be implemented by the Owner upon approval by the Director.

(9) The Owner shall ensure that any proposed changes to the site-specific trigger levels for leachate impacts to surface water or groundwater, are approved in advance by the Director via an amendment to this Approval.

Changes to the Monitoring Plan, Trigger Mechanism and Contingency Plan

(10) The Owner may request to make changes to the environmental monitoring program, Trigger Mechanism and Contingency Plan to the District Manager in accordance with the recommendations of the annual report. The Owner shall make clear reference to the proposed changes in a separate letter that shall accompany the annual report.

(11) Within fourteen (14) days of receiving the written correspondence from the District Manager confirming that the District Manager is in agreement with the proposed changes to the environmental monitoring program, the Owner shall forward a letter identifying the proposed changes and a copy of the correspondences from the District Manager and all other correspondences and responses related to the changes to the monitoring program, to the Director requesting the Approval be amended to approve the proposed changes to the environmental monitoring plan prior to implementation.

(12) In the event any other changes to the environmental monitoring program are proposed outside of the recommendation of the annual report, the Owner shall follow current Ministry procedures for seeking approval for amending the Approval.

5. LEACHATE MANAGEMENT AND DISPOSAL

(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site Leachate Treatment System, in accordance with the terms and conditions of the Industrial Sewage Works Approval No. 1122-BKUPSM dated February 3, 2020, as amended.

(a) Notwithstanding Condition 5(1), leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.

(2) Leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall not be discharged to the natural environment at any time.

(3) Any alternative proposal for leachate management and disposal must receive prior written approval of the District Manager.

(4) The Owner shall reduce the level of leachate within the landfill to an elevation 191 metres above mean sea level (AMSL), which equates to an average leachate depth of no greater than 0.3 metres, by the earlier of:

(a) five (5) years from the issuance date of this ECA; or
(b) the date the landfill reaches capacity.

(5) In addition to the requirements of Condition 5(4), the interim annual leachate elevation levels and interim landfill capacity-based leachate elevations shall be adhered to pursuant to Schedules "C" and "D" respectively.

(a) The leachate elevation, as determined by the pressure transducer located in the leachate collection sump riser pipe shall be used to establish the landfill leachate elevation. The leachate elevation will be considered in compliance with the target leachate elevations if the measurement meets the elevations stated in Schedules "C" and "D" within fifteen (15) days of the compliance date.

(6) The Owner shall implement the leachate management contingency measures in the report titled "Leachate Removal Plan, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited", prepared February 7, 2020, as amended, as necessary to meet the leachate elevations in Schedules "C" and "D".

(a) if the leachate elevations in Schedules "C" and "D" are not met within 105 days of the anniversary date of the issuance of this Approval the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below the leachate elevation in Schedules "C" and "D":
    (i) notify the District Manager;
    (ii) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site;
    (iii) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site;
    (iv) install interim cover to cells that have not reached final waste contours and to the working face;
    (v) install final cover to cells that have reached final waste contours;
    (vi) establish vegetation on installed cover material where appropriate and weather permitting; and
    (vii) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.

(b) landfilling activities may commence again when the compliance leachate elevation has been attained; and
(c) prior to amending the Leachate Removal Plan proposed amendments shall be submitted to the District Manager for approval.

(7) If the leachate elevation in the landfill reaches 199.0 metres AMSL, the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below 199.0 metres AMSL:

(a) notify the District Manager;
(b) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site;
(c) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site;
(d) install interim cover to cells that have not reached final waste contours and to the working face;
(e) install final cover to cells that have reached final waste contours;
(f) establish vegetation on installed cover material where appropriate and weather permitting; and
(g) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.

(8) The Owner shall monitor leachate in accordance with the monitoring program outlined in Schedule "B".

6. LANDFILL GAS MANAGEMENT

(1) The Owner/Operator shall ensure that all buildings and structures containing enclosed spaces at the Site, shall be situated, constructed and monitored in a manner which minimizes the potential for explosive hazards due to landfill gas. The Owner/Operator shall install and maintain in good working condition, methane detection and alarm equipment (with active venting or with an effective passive venting system to relieve any possible landfill gas accumulation) for all enclosed buildings at the Site.

(2) The Owner/Operator shall ensure that site design plans, specifications and descriptions for the control of landfill gas are such that the subsurface migration of landfill gas meets the requirements of the Ministry's Landfill Standards Guideline, Section 4.10, including but not limited to the following:

(a) the concentration of methane gas below the ground surface at the Site boundary must be less than 2.5 per cent by volume;
(b) the concentration of methane gas in any on-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, if the building or structure is accessible to any person or contains electrical equipment or a potential source of ignition, must be less than 1.0 per cent by volume;
(c) sub-condition (b) does not apply to a leachate collection, storage or treatment facility or a landfill gas collection or treatment facility for which specific health and safety measures and procedures are in place relating to the risk of asphyxiation and the risk of explosion; and
(d) the concentration of methane gas from the Site in any off-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, must be less than 0.05 per cent by volume (i.e. not present).

(3) If the measured gas concentration at a gas probe exceeds the applicable limit listed in Condition 6(2) above, the District Manager shall be notified immediately. The gas concentrations shall be re-measured immediately and daily for a period of up to three (3) consecutive days. If these readings confirm that the applicable limit has been exceeded, the Owner/Operator shall forthwith, implement appropriate control measures.

(4) The Owner shall monitor landfill gas in accordance with the monitoring program outlined in Schedule "B".

7. STORMWATER MANAGEMENT

(1) Stormwater runoff generated from the active waste fill area shall be treated by the Owner/Operator as leachate. The Owner/Operator shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system. If necessary, granular sumps shall be dug into the waste to facilitate drainage of contaminated stormwater towards the leachate collection system.

(2) The Owner shall monitor the stormwater management pond in accordance with the monitoring program outlined in Schedule "B".

8. EMPLOYEE TRAINING

(1) A training plan for all employees that operate any aspect of the Site shall be developed and implemented by the Owner or the Operator. Only Trained Personnel shall operate any aspect of the Site or carry out any activity required under this Approval.

(2) The Owner shall ensure that all site operations employees have been adequately trained and received on-going training with respect to the following, but not limited to:

(a) terms, conditions and operating requirements of this Approval for the Site;
(b) the operation, inspection, and maintenance of the Site with respect to the approved design and operations documents;
(c) relevant waste management legislation and regulations;
(d) environmental concerns related to waste management at the Site;
(e) occupational Health and Safety concerns related to waste management at the Site; and
(f) emergency procedures and contingency plans in case of fire, spills, off-site impacts and any other emergency situations.

9. COMPLAINTS RESPONSE PROCEDURE

(1) If at any time the Owner receives complaints regarding the operation of the Site, the Owner shall respond to these complaints according to the following procedure:

(a) The Owner shall record and number each complaint, either electronically or in a log book, and shall include the following information: the nature of the complaint, the name, address and the telephone number of the complainant if the complainant will provide this information and the time and date of the complaint;
(b) The Owner, upon notification of the complaint, shall initiate appropriate steps to determine possible causes of the complaint, proceed to take the necessary actions to eliminate the cause of the complaint and forward a written reply to the complainant; and
(c) The Owner shall complete and retain on-site a report written within one (1) week of the complaint date, listing the actions taken to resolve the complaint and recommendations, if any, for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents.

10. EMERGENCY AND SPILL RESPONSE

(1) All Spills as defined in the EPA occurring at or from the Site shall be immediately reported to the **Ministry's Spills Action Centre at 1-800-268-6060** and shall be recorded in the log book. The Owner/Operator shall record for each Spill event the contaminant(s) spilled, the quantity or volume of contaminants spilled, the spatial distribution of the area impacted by the Spill, a root cause analysis of the events leading up to the Spill and a list of actions designed to prevent similar Spill events.

(2) In addition, the Owner shall submit, to the District Manager a written report within three (3) business days of the Spill event, outlining the nature of the incident, remedial measures taken, handling of waste generated as a result of the emergency situation and the measures taken to prevent future occurrences at the Site.

(3) All wastes resulting from a Spill event shall be managed and disposed of in accordance with the EPA and Regulation 347.

(4) All equipment and materials required to handle the Spill event shall be:

(a) kept on hand at all times that waste landfilling and/or handling is undertaken at the Site; and
(b) adequately maintained and kept in good repair.

(5) The Owner shall ensure that the emergency response personnel are familiar with the use of such equipment and its location(s).

11. PUBLIC LIAISON COMMITTEE (PLC)

(1) The Owner or Operator shall maintain and participate in a landfill PLC, which shall function in accordance with the Terms of Reference for the PLC, as amended from time to time. Any amendment to the Terms of Reference must be approved by the District Manager. The PLC shall serve as a forum for dissemination, consultation, review and exchange of information regarding the operation of the landfill Site, including environmental monitoring, maintenance, complaint resolution, and new approvals or amendments to existing approvals related to the operation of this landfill Site.

(2) The Owner/Operator shall invite representation from the following groups to participate on the PLC:

(a) the County of Haldimand;
(b) Six Nations of the Grand River;
(c) landowners within a minimum 500 metre distance of the Site;
(d) residents of Haldimand County; and
(e) Lower Grand River Land Trust.

The number of representatives from each group shall be as specified in the Terms of Reference approved by the District Manager.

(3) Copies of all reports or other submissions required by the conditions of this Approval shall be made available to the PLC and the County of Haldimand, in accordance with the deadlines specified in the Conditions.

(4) The Owner or Operator shall provide to the PLC and the County of Haldimand, reasonable notice and opportunities to make comments regarding any proposed amendment to this Approval. The Owner or Operator shall forward to the Director for consideration any written comments received by the Owner or Operator and advise the Director of the essence of any verbal comments received by the Owner or Operator regarding the proposed amendment.

12. INSPECTIONS, RECORD KEEPING AND REPORTING

Daily Inspections and Inspection Log

(1) A visual inspection of the entire Site and all equipment on the Site shall be conducted each day the Site is open to ensure that:
(a) the Site is secure;
(b) the operation of the Site is not causing any nuisances;
(c) the operation of the Site is not causing any adverse effects on the environment or impairing water quality; and
(d) the Site is being operated in compliance with this Approval.

(2) Any deficiencies discovered as a result of the inspection shall be remedied immediately, including temporarily ceasing operations at the Site if needed**.**

(3) An electronic or written record of the inspections shall be maintained and shall include the following:
(a) the name and signature of person that conducted the inspection;
(b) the date and time of the inspection;
(c) the list of all deficiencies discovered during the inspections, including but not limited to:
(i) the presence of any leachate seeps;
(ii) the condition of the methane venting system;
(iii) poor drainage conditions and ponding of surface water; and
(iv) the presence of waste outside of the approved fill area;

(d) the recommendations for remedial action to address the identified deficiencies; and
(e) the date, time and description of the remedial actions taken.

Daily Waste Log

(4) A daily log shall be maintained in written or electronic format and shall include the following information:
(a) the type, date and estimated quantity (tonnes) of all waste, including non-landfilled waste received at the Site;
(b) the type, date and estimated quantity (tonnes) of cover material applied at the Site;
(c) the area of the Site in which waste disposal operations are taking place;
(d) a record of litter collection activities and the application of any dust suppressants;
(e) a record of all refusals of waste shipments, the reason(s) for refusal, and the origin of the waste, if known; and
(f) a description of any out-of-service period of any control, treatment, disposal or monitoring facilities, the reasons for the loss of service, and action taken to restore and maintain service.

Other Information

(5) Any information requested, by the Director, the District Manager or a Provincial Officer, concerning the Site and its operation under this Approval, including but not limited to any records required to be kept by this Approval shall be provided to the Ministry, upon request.

Annual Report

(6) A written report on the development, operation and monitoring of the Site, shall be completed annually (the "Annual Report"). The Annual Report shall be submitted to the District Manager, by March 31st of the year following the period being reported upon.

(7) The Annual Report shall include but not be limited to the following information:

(a) the results and an interpretive analysis of the results of all leachate, groundwater surface water and landfill gas monitoring, including an assessment of the need to amend the monitoring programs;
(b) an assessment on the Site's compliance with Guideline B7;
(c) an assessment of the operation and performance of all engineered facilities, the need to amend the design or operation of the Site, and the adequacy of and need to implement the Ministry approved contingency plans;
(d) site plans showing the existing contours of the Site; areas of landfilling operation during the reporting period; areas of intended operation during the next reporting period; areas of excavation during the reporting period; the progress of final cover, vegetative cover, and any intermediate cover application; facilities existing, added or removed during the reporting period; and site preparations and facilities planned for installation during the next reporting period;
(e) summaries of any actions taken for the odour management plan and compliance with the leachate removal plan;
(f) calculations of the volume of waste, daily and intermediate cover, and final cover deposited or

placed at the Site during the reporting period and a calculation of the total volume of Site capacity used during the reporting period;

(g) a calculation of the remaining capacity of the Site or an estimate of the remaining Site life;
(h) summary of total annual quantity (tonnes) of waste received at the Site;
(i) a summary of any complaints received and the responses made;
(j) a summary of the information included in the logs required by Conditions 9(1), 10(1), 11(3), 11(4), 11(5), and 12(2);
(k) a summary of the daily waste log;
(l) a discussion of any operational problems encountered at the Site and corrective action taken;
(m) any changes to the Ministry approved Design and Operations Report and the Closure Plan that have been approved by the Director since the last Annual Report;
(n) a report on the status of all monitoring wells and a statement as to compliance with Regulation 903;
(o) a description and location of any leachate seeps identified during the daily inspection of the Site and the mitigative measures taken to address the presence of seeps;
(p) a summary of the daily inspections conducted over the monitoring period;
(q) any other information with respect to the Site which the District Manager may require from time to time;
(r) a copy of the most current ministry approved monitoring programs in table format;
(s) compliance status with all conditions of the Approval and the approved Design and Operations Plan;
(t) a "Monitoring and Screening Checklist" completed and signed by a Qualified Professional; and
(u) items identified in Section 7.7 Annual Progress Report of the Design and Operations Report;

13. CLOSURE PLAN

(1) At least two (2) years prior to the anticipated date of closure of this Site, or when the Site reaches 90% capacity, whichever comes first, the Owner shall submit to the Director for approval, with copies to the District Manager, a detailed Site closure plan pertaining to the termination of landfilling operations at this Site, post-closure inspection, maintenance and monitoring, and end use. The plan shall include but not be limited to the following information:

(a) A plan showing Site appearance after closure;
(b) A description of the proposed end-use of the Site;
(c) Description of the procedures for closure of the Site, including:
    i. advance notification of the public of the landfill closure;
    ii. posting of a sign at the Site entrance indicating the landfill is closed and identifying any alternative waste disposal arrangements;
    iii. completion, inspection and maintenance of the final cover and landscaping;
    iv. site security;
    v. removal of unnecessary landfill-related structures, buildings and facilities;
    vi. final construction of any control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas; and
    vii. a schedule indicating the time-period for implementing sub-conditions (i) to (vi) above.

(d) Description of the procedures for post-closure care of the Site, including:
   i. operation, inspection and maintenance of the control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas;
   ii. record keeping and reporting; and
   iii. complaint contact and response procedures;
(e) An assessment of the adequacy of and need to implement the contingency plans for leachate and landfill gas;
(f) An updated estimate of the contaminating life span of the Site, based on the results of the monitoring programs to date; and
(g) An update of the cost estimate for financial assurance and the amount which has been provided to the Director.

(2) The Site shall be closed in accordance with the closure plan as approved by the Director.

The following Schedule "A" forms part of this Approval

Schedule "A"

1. Application for an amendment to ECA No. A110302 for a vertical expansion. Signed by Richard Weldon, Managing Partner, 2270386 Ontario Limited. Dated April 26, 2019. The application includes all supporting documentation and consists of the following:

   i. Design and Operations Report Vertical Expansion, Brooks Road Landfill Site, 2270386 Ontario Inc., Prepared by GHD, April 18, 2019;
   ii. Appendix A - Provisional CofA No. A110302 and Amendments;
   iii. Appendix B - Site Preparation Reports;
   iv. Appendix C - Site Legal Surveys;
   v. Appendix D - Geotechnical Assessment;
   vi. Appendix E - HELP Model Outputs;
   vii. Appendix F - Hydrologic Modeling;
   vii. Appendix G - Surface Water Supporting Engineering Calculations;
   viii. Appendix H - Landfill Gas Production and Air Dispersion Modeling Results;
   ix. Appendix I - Fugitive Odour Best Management Practices Plan and BRE Odour Complaint Response Procedure;
   ix. Appendix J - Trigger Level Program;
   ix. Appendix K - Financial Assurance Plan; and
   ix. Appendix L - Design and Operations Report Drawings.

2. Leachate Removal Plan, Brooks Road landfill Site Haldimand County, 2270386 Ontario Limited. Report No 90. Prepared by GHD, February 7, 2020.

Notes:

1. Groundwater levels will be measured during May and November sampling events.

2. Surface water levels and flows will be measured for all sampling events.

3. **A - Indicator parameters (groundwater):** alkalinity, ammonia, barium, boron, calcium, chloride,

conductivity, iron, magnesium, nitrate, pH, sodium, TDS, sulphate, COD, and DOC.

4. **B - Metals:** aluminum, arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, nickel.

   B - PAHs: naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(j)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, benzo(ghi)perylene.

   B - VOCs: chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, trans-1,2-dichloroethene, methyl-t-butyl ether, 1,1-dichloroethane, methyl ethyl ketone, cis-1,2-dichloroethene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane trichloroethene, bromodichloromethane, cis-1,3-dichloropropene, methyl isobutyl ketone, trans-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m,p,o-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene.

   B - Inorganic chemistry parameters: alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulfates, DOC, TDS, suspended solids, phenol, BOD5, COD, pH, total phosphorus, potassium, conductivity, calcium.

5. **C - Indicator parameters (surface water):** alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, pH, total phosphorus, TDS, suspended solids, sulphate, BOD5, COD, phenol, temperature, and dissolved oxygen.

6. **WL - only:** water level or leachate level only.

7. **Leachate:** Leachate water levels shall be collected on a monthly basis at leachate monitoring well LW1-17 and the inclined leachate collection sump riser pipe, while an annual leachate chemistry sample is required to be collected in May from the collection sump. Compliance with the leachate level elevation shall be determined by the pressure transducer that is located in the leachate collection sump riser pipe.

8. **Landfill Gas:** Sampling is to occur monthly from December 1 to April 30 and quarterly from May through November for % lower explosive limit methane concentration of combustible gas, carbon dioxide, oxygen and balance gases, gas pressure, and water level.

The following Schedule "C" forms part of this Approval

Schedule "C"

Table C1: Target leachate elevations to reach leachate elevation 191 m AMSL based on the anniversary date of the issuance of this Approval.

Year (From Date of Issuance of this ECA)	Required Leachate Elevation (m AMSL)	Estimated Leachate Volume in Landfill (m^3)	Volume Removed in Excess of Generation (m^3)	Forecasted Leachate Generation Rate (m^3/day)	LTS Discharge to Ditch (m^3/day)	Required Average Excess Leachate Removal (m^3/day)
0	198.5	40,000	-	44	45	0
1	196	28,000	12,000	44	45	32
2	193.8	18,000	10,000	42	45	24
3	192.1	10,000	8,000	44	45	21
4	191.3	4,000	6,000	45	45	16
5	191	2,000	2,000	49	45	9.5
6+	191	2,000	0	33	45	0

The following Schedule "D" forms part of this Approval

Schedule "D"

Table D1: Capacity-Based Target Leachate Elevations

Estimated Landfilled Volume (m^3)	Required Leachate Elevation (m AMSL)
680,000	197.9
710,000	197.4
740,000	196.8
770,000	196.2
800,000	195.7
830,000	195.1
860,000	194.5
890,000	193.9
920,000	193.4
950,000	192.8
980,000	192.2
1,010,000	191.7
1,040,000	191.1
1,045,065	191.0

The reasons for the imposition of these terms and conditions are as follows:

Conditions 1(1), 1(2), 1(4), 1(5), 1(6), 1(7), 1(8), 1(9), 1(10), 1(11), 1(13), 1(20), 1(21), 1(22), and 1(23) are to clarify the legal rights and responsibilities of the Owner and Operator under this Approval.

Conditions 1(3) and 7(4) are to ensure that the Site is designed, operated, monitored and maintained in accordance with the application and supporting documentation submitted by the Owner, and not in a manner which the Director has not been asked to consider.

Condition 1(12) is to ensure that the Site is operated under the corporate name which appears on the application form submitted for this approval and to ensure that the Director is informed of any changes.

Condition 1(14) is to restrict potential transfer or encumbrance of the Site without the approval of the Director and to ensure that any transfer of encumbrance can be made only on the basis that it will not endanger compliance with this Approval.

Condition 1(15) is to ensure that the successor is aware of its legal responsibilities.

Conditions 1(16), 1(17) and 1(18) clarify that the Part II.1 Director is an individual with authority pursuant to

Section 197 of the Environmental Protection Act to require registration on title and provide any person with an interest in property before dealing with the property in any way to give a copy of the Approval to any person who will acquire an interest in the property as a result of the dealing.

Condition 1(19) is to ensure that appropriate Ministry staff has ready access to the Site for inspection of facilities, equipment, practices and operations required by the conditions in this Approval. This Condition is supplementary to the powers of entry afforded a Provincial Officer pursuant to the Act, the OWRA, the PA, the NMA and the SDWA.

Condition 1(24) clarifies what information may be subject to the Freedom of Information Act.

Condition 2(1) is to ensure that sufficient funds are available to the Ministry for closure and post-closure activities at the Site in the event that the Owner is unable or unwilling to do so.

Conditions 3(1), 3(11), 3(12), 3(13), 3(14), 3(15), 3(16), 12(1) and 12(2) are to ensure that the Site is operated, inspected and maintained in an environmentally acceptable manner and does not result in a hazard or nuisance to the natural environment or any person.

Conditions 3(2), 3(3), 3(4), and 3(5) are to specify the approved area from which waste may be accepted at the Site, and the types of waste that may be accepted for disposal at the Site based on the Owner's application and supporting documentation.

Conditions 3(6), 3(7), and 3(8) are to specify restrictions on the extent of landfilling and the maximum rates to be accepted for disposal at the Site based on the Owner's application and supporting documentation. These limits define the approved volumetric capacity of the site.

Conditions 3(9) and 3(10) are to ensure that users of the Site are fully aware of important information and restrictions related to Site operations and access under this Approval.

Condition 3(17) is to ensure open burning of municipal waste is unacceptable because of concerns with air emissions, smoke and other nuisance effects, and the potential fire hazard.

Condition 3(18) is to ensure that uncontrolled removal of material from waste at the Site is avoided. Scavenging of deposited waste can be detrimental to the public health and safety and cause damage to the natural environment.

Conditions 3(19) and 3(20) are to specify the hours of operation for the landfill site and a mechanism for amendment of the hours of operation, as required.

Conditions 3(21) and 3(22) are to ensure that the Site is supervised by properly trained staff in a manner which does not result in a hazard or nuisance to the natural environment or any person and to ensure the controlled access and integrity of the Site by preventing unauthorized access when the Site is closed and no site attendant is on duty.

Condition 3(23) is to specify the approval requirements for use of alternative cover material at the Site.

Condition 3(24) is to ensure that daily and intermediate cover is used to control potential nuisance effects, to facilitate vehicle access on the site, and to ensure an acceptable site appearance is maintained. The proper closure of a landfill site requires the application of a final cover which is aesthetically pleasing, controls infiltration, and is suitable for the end use planned for the site.

Condition 3(25) is to ensure that potential truck traffic impacts on the immediate local community is limited to the existing main roads.

Condition 3(26) is to ensure that public road servicing the Site (described as "Improvement Area") meets the applicable standards. Condition 3(26) also ensures that the Improvement Area is maintained regularly as per agreement between the Owner/Operator of the Site and Haldimand County.

Conditions 3(27), 3(28), 3(29), 3(30), 3(31), and 3(32) are to ensure that the Site is operated in a manner that does not result in unacceptable odour emissions and mitigation measures are employed in event of an odour impact.

Condition 4(1) is to provide the groundwater and surface water limits to prevent water pollution at the Site

Conditions 4(2), 4(3), 5(2), 6(4), and 7(2) are included to require the Owner to demonstrate that the Site is performing as designed and the impacts on the natural environment are acceptable. Regular monitoring allows for the analysis of trends over time and ensures that there is an early warning of potential problems so that any necessary remedial/contingency action can be taken.

Conditions 4(4), 4(5), and 4(6) are included to ensure the integrity of the groundwater monitoring network so that accurate monitoring results are achieved and the natural environment is protected.

Conditions 4(7), 4(8), and 4(9) are added to ensure the Owner has a plan with an organized set of procedures for identifying and responding to potential issues relating to groundwater and surface water contamination at the Site's compliance point.

Conditions 4(10), 4(11), and 4(12) are included to streamline the approval of the changes to the monitoring plan.

Condition 5(1) is added to ensure that leachate generated at this Site is disposed of in an environmentally acceptable manner.

Conditions 6(1), 6(2), 6(3), and 6(5) are to ensure that off-site migration of landfill gas is monitored and all buildings at the Site are free of any landfill gas accumulation, which due to a methane gas component may be explosive and thus create a danger to any persons at the Site.

Condition 7(1) is added to ensure to ensure that both surface water and stormwater is managed in an environmentally acceptable manner.

Conditions 8(1) and 8(2) are to ensure that the Site is operated by properly trained staff in a manner which does not result in a hazard or nuisance to the natural environment or any person.

Condition 9(1) is added to ensure that any complaints regarding landfill operations at this Site are responded to in a timely and efficient manner.

Condition 10(1) is to ensure the Owner immediately responds to a spill.

Conditions 10(2), 10(3), 10(4), and 10(5) are to ensure that the Owner notifies the Ministry forthwith of any spills so that an appropriate response can be determined.

Conditions 11(1), 11(2), 11(3), and 11(4) are added to establish a forum for the exchange of information and public dialogue on activities carried out at the landfill Site. Open communication with the public and local authorities is important in helping to maintain high standards for site operation and protection of the natural environment.

Condition 12(3) is to ensure that detailed records of Site inspections are recorded and maintained for inspection and information purposes.

Condition 12(4) and 12(5) are added to ensure that accurate waste records are maintained to ensure compliance with the conditions in this Approval (such as fill rate, site capacity, record keeping, annual reporting, and financial assurance requirements), the EPA and its regulations.

Conditions 12(6) and 12(7) are added to ensure that regular review of site development, operations and monitoring data is documented and any possible improvements to site design, operations or monitoring programs are identified. An annual report is an important tool used in reviewing site activities and for determining the effectiveness of site design.

Condition 13(1) is added to ensure that final closure of the Site is completed in an aesthetically pleasing manner, in accordance with Ministry standards, and to ensure the long-term protection of the health and safety of the public and the environment.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). A110302 issued on July 10, 1980

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental

compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment, Conservation and Parks
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 326-5370 or www.ert.gov.on.ca**

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 27th day of March, 2020

Mohsen Keyvani, P.Eng.
Director
appointed for the purposes of Part II.1 of the
Environmental Protection Act

CF/

c: District Manager, MECP Hamilton - District
Daniel Turner P. Eng., GHD

Appendix D

Groundwater and Surface Water Sampling Protocols and 2020 Monitoring Program Specifications

Appendix D1

Groundwater and Surface Water Sampling Protocols

Groundwater and surface water samples were collected by GHD personnel following standard sample collection protocols that are designed to ensure representative water quality samples are obtained during monitoring events. During the monitoring events, field water level information, purging information, and field measured parameters were recorded.

The following groundwater sampling protocols were adhered to during the monitoring events:

- Dedicated polyethylene tubing and a Waterra™ foot valve were installed in each monitoring well to reduce the opportunity for cross contamination between wells.
- Prior to groundwater sample collection, each well was purged of the standing volume of stagnant water. The objective of purging is to pump groundwater from the well until a representative sample of the groundwater is obtained. This is generally achieved by removing the three to five times the volume of standing water in the well (USEPA Convention). All groundwater wells were purged a minimum of three well volumes and then sampled, unless the well was purged dry, in which case the groundwater samples were collected the same day after allowing the well to recover for up to several hours. Purging is considered complete once sediment free groundwater is obtained and the temperature, conductivity, and pH of the groundwater stabilizes. Groundwater stabilization has occurred if three consecutive well volume measurements of temperature and conductivity are approximately plus or minus 10 percent and if the pH values are within 1.0 pH unit of the last three value averages.
- Groundwater samples were collected in the appropriate laboratory-supplied sample containers and preserved as required. Groundwater samples designated for dissolved metals and selected general chemistry parameters were field filtered using 0.45 μm in-line disposable filters to remove all silt and the majority of clay-sized particles from the samples.
- The sample containers were packaged in a cooler, stored between 0°C and 10°C, and delivered to the laboratory within a 24-hour period for analysis.
- Groundwater monitoring wells were sampled in the following order, if possible, to limit the potential for monitoring well cross-contamination:

Sample No.	Well No.	Sample No.	Well No.	Sample No.	Well No.
1	MW5A-09	13	MW2D-07	25	MW10A-18
2	MW5B-09	14	MW2S-07	26	MW10B-18

12	OW9B-06	24	MW11B-19		

Groundwater samples were submitted under chain-of-custody protocol to ALS Laboratory Group in Waterloo, Ontario, for analysis.

In order to avoid cross contamination during groundwater sampling activities, the following stringent decontamination procedure was followed. It is necessary that all equipment be decontaminated prior to commencing work on-Site and prior to leaving the Site at the end of each day. Furthermore, any equipment that contacts well water must be decontaminated between wells as follows:

- Wash with clean potable water and laboratory detergent (Alconox or similar solution) using a soft bristled brush if necessary to remove any sediment, particles or surface films. For equipment that cannot be adequately cleaned with a brush such as internal mechanisms or piping, the decontamination solutions shall be circulated through the equipment.
- Rinse thoroughly with de-ionized water and allow to air dry.
- Wrap equipment with aluminum foil (shiny side out), if applicable.
- The water level probe must be decontaminated as per the procedures described above between each well location.
- New gloves should be worn when performing a new task. Furthermore, new gloves must be worn prior to sample collection.

The following surface water sampling protocols were adhered to during the monitoring events:

- An attempt to collect surface water samples during or immediately following a precipitation event, if possible.
- When the surface water samples were collected, the laboratory-supplied sample containers were inverted and submersed to the desired sample depth and then the opening of the bottled was tilted to fill. When possible samples were collected approximately 6 inches (15 cm) below the surface with the sample baffles completely submerged to prevent floating debris from entering the sample bottles. Floating debris could result in unrepresentative analytical data.
- Wading in the water was avoided to reduce agitating bottom sediment deposits in the sample, which could result in a biased sample.
- If the bottles contained preservative, a pre-cleaned unpreserved bottle was used to collect the sample before transferring the water sample to the appropriate preserved bottles.
- The sample containers were packaged in a cooler, stored between 0°C and 10°C and delivered to the laboratory within a 24-hour period for analysis.

Surface water samples were submitted under chain-of-custody protocol to ALS Laboratory Group in Waterloo, Ontario, for analysis.

GHD
2021 SITE MONITORING SPECIFICATIONS

PROJECT:	Brooks Road Landfill Site
PROJECT NO.:	018235
PROJECT MANAGER:	Ryan Loveday
PROJECT COORDINATOR:	Brian Packer

MONITORING STAFF:	**RESPONSIBILITY**
Patrick Whittier	GHD Field Technician
Stephanie Berton	Coordinator/Chemist QA/QC

LABORATORIES USED: ALS Canada Ltd.

AUTHORIZATION:	**MONITORING EVENT**	**SIGNATURE**	**DATE**
	March		
	May		
	August		
	November		

MONITORING DESCRIPTION

A. GROUNDWATER MONITORING
B. SURFACE WATER MONITORING
C. LEACHATE QUALITY MONITORING
D. LEACHATE MOUNDING
E. LANDFILL GAS MONITORING

SPECIAL INSTRUCTIONS:

- Measure Gas Pressure, % LEL, and CH3 concentration at MW2A-01
- On the chain of custody, indicate in the comments section which parameter list the samples are to be analyzed for (i.e., List A - F)
- Document integrity and deficiencies of all monitoring wells
- MW2C-01 is no longer sampled
- Sample Bedrock Wells (D/S) – August only
- Leachate levels are to be recorded in March, May, August, and November from LCS and LW1-17
- Sample Leachate Collection System in August only
- Identify on the COC which sample is the Leachate Sample and request the lab to attempt to lower the detection limits for PAHs and VOCs

A) GROUNDWATER MONITORING

i) Field Technician: Dan Daum

ii) Monitoring Locations: A total of 34 sampling locations as indicated below:

MW5A-09	MW2D-07**	MW10A-18
MW5B-09	MW2S-07**	MW10B-18
MW6A-07	MW2A-01	OW8D-07**
MW6B-07	MW2B-07	OW8S-07**
MW1D-07**	MW12A-19	OW8A-06
MW1S-07**	MW12B-19	OW8B-06
MW1A-13	OW5B-06	MW4A-09*
MW1B-13	OW5A-06	MW2-03*
OW3A-13	OW1A-06	MW3-03*
OW3B-13	OW1B-06	MW1-03*
OW9A-06	MW11A-19	
OW9B-06	MW11B-19	

Notes:

* - Indicates water level only
** - Indicates water level only in November, sample in May

iii) Monitoring Frequency:

Groundwater Levels: May and November
Groundwater Quality: Annually in August
Groundwater Quality: Semi-Annually in November
Selected Wells (Table 1)

iv) Sampling Parameters:

Field

pH, conductivity, and temperature

Selected Wells (Table 1) – May and November
pH, conductivity, and temperature

Laboratory

Selected Wells (Table 1) – May
Inorganic Chemistry, Metals, PAHs, and VOCs – Table 2, List B

Selected Wells (Table 1) – November
Indicator Parameters (groundwater) – Table 2, List A

B) SURFACE WATER MONITORING

i) Field Technician: Dan Daum

ii) Monitoring Locations: A total of 10 sampling locations as indicated below:

SW1
SW2
SW3
SW4
SW5
SW6
SW7
SW8
SW9
PSWMS Pond

iii) Monitoring Frequency:

Surface Water Flow and Surface Water Levels (According to Table 1)

Quarterly in March, May, August, and November

Surface Water Quality

Semi-annually in March and August – List C/F – Tables 1 and 2
Semi-annually in May and November – List D – Tables 1 and 2

iv) Sampling Parameters:

Field

pH, conductivity, dissolved oxygen, and temperature

Laboratory

List C (March and August)

Indicator Parameters (Surface Water) – Table 2, List C

List D (May and November)

Inorganic chemistry, Metals, PAHs, and VOCs – Table 2, List B

List F (March, May, August, November)

PSWMS Pond Parameters - Table 2, List D

C) LEACHATE QUALITY MONITORING

i) Field Technician: Dan Daum

ii) Monitoring Locations:

Leachate Collection System
Leachate Well

iii) Monitoring Frequency:

Leachate Collection System – sampled annually in May
Leachate Collection System and LW1-17 – liquid levels measured quarterly in March, May, August, November

iv) Sampling Parameters:

Field

Leachate Collection System – May
pH, conductivity, and temperature
Leachate Storage Tank – March, May, August, November
pH, conductivity, temperature, and dissolved oxygen

Laboratory

Leachate Collection System – May
Inorganic chemistry, Metals, PAHs, and VOCs – Table 2, list D
Leachate Storage Tank – March, May, August, November
Inorganic chemistry, Metals, PAHs, and VOCs – Table 2, list D

D) LEACHATE MOUNDING

i) Field Technician: Dan Daum

ii) Monitoring Locations:

Within deposited waste
Leachate Collection System (Leachate Collection System Riser Pipe)

iii) Monitoring Frequency:

Quarterly

iv) Sampling Parameters:

Field

Elevation of leachate mound

E) LANDFILL GAS MONITORING

i) Field Technician: Dan Daum

ii) Monitoring Locations: A total of 12 sampling locations as indicated below:

Locations

GP-1S
GP-1D
GP-2S
GP-2D
GP-3S
GP-3D
GP-4S
GP-4D
GP5-19
GP6-19
GP7-19
GP8-19

iii) Monitoring Frequency:

Monthly – between December 1 and April 30

Quarterly – between May 1 and November 30

iv) Sampling Parameters:

Field

% Lower Explosive Limit (LEL)
Methane Concentration (CH_4)
Carbon dioxide (CO_2)
Oxygen (O_2)
Pressure

Notes:

[1] Groundwater levels will be measured at all monitoring wells during the May and November sampling events

[2] Surface water levels and flows will be measured during all surface water sampling events at all surface water locations

[3] List E - Trigger Parameter samples are collected and reviewed prior to discharging water from the SWMS Pond

Refer to Table 2 for the list of parameters

List A - indicator parameters (groundwater)

List B - inorganic chemistry, metals, PAHs, VOCs

List C - indicator parameters (surface water)

List D - TDS Pond Parameters

List E - Effluent Discharge Parameters

Table D.2

Environmental Monitoring Program
2021 List of Analytical Parameters
Brooks Road Landfill Site
Haldimand County, Ontario

List (s)	Analytical Group	Analytical Parameters
A	Indicator Parameters (groundwater)	alkalinity, ammonia, barium, boron, calcium, chloride, conductivity, iron, magnesium, nitrate, pH, sodium, TDS, sulphate, COD, DOC, turbidity
B	Inorganic Chemistry	alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulfate, DOC, TDS, suspended solids, phenol, BOD_5, COD, pH, total phosphorus, conductivity, turbidity
B	Metals	arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, nickel, potassium, calcium, aluminum
B	PAHs	naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(j)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene,
B	VOCs	chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, trans-1,2-dichloroethene, methyl-t-butyl ether, 1,1-dichloroethane, methyl ethyl ketone, cis-1,2-dichloroethene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane, trichloroethene, bromodichloromethane, cis-1,3-dichloropropene, methyl isobutyl ketone, trans-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m,p,o-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene
C	Indicator Parameters (surface water)	alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, pH, total phosphorus, TDS, suspended solids, sulphate, BOD5, COD, phenol, turbidity, temperature (field), and dissolved oxygen (field)
D	PSWMS Pond Parameters	General Chemistry: alkalinity, conductivity, hardness, pH, chloride, sulphate, nitrite, nitrate, ammonia, TSS, TDS, COD, total phosphorus, TKN, BOD_5, phenols Metals: arsenic, barium, boron, cadmium, chromium, copper, iron, lead, mercury, zinc Organics: ethylbenzene, naphthalene, benzo(a)pyrene Field Parameters: conductivity, dissolved oxygen, pH, temperature
