Sample Date:			**5/17/2017**	**12/27/2017**
Parameters	**Units**	**PWQO [1]**		
Volatile Organic Compounds				
1,1,1,2-Tetrachloroethane	ug/L	20	< 0.50	< 0.50
1,1,1-Trichloroethane	ug/L	10	< 0.50	< 0.50
1,1,2,2-Tetrachloroethane	ug/L	70	< 0.50	< 0.50
1,1,2-Trichloroethane	ug/L	800	< 0.50	< 0.50
1,1-Dichloroethane	ug/L	200	< 0.50	< 0.50
1,1-Dichloroethene	ug/L	40	< 0.50	< 0.50
1,2-Dibromoethane (Ethylene dibromide)	ug/L	5	< 0.50	< 0.50
1,2-Dichlorobenzene	ug/L	2.5	< 0.50	< 0.50
1,2-Dichloroethane	ug/L	100	< 0.50	< 0.50
1,2-Dichloropropane	ug/L	0.7	< 0.50	< 0.50
1,3-Dichlorobenzene	ug/L	2.5	< 0.50	< 0.50
1,4-Dichlorobenzene	ug/L	4	< 1.0	< 1.0
2-Butanone (Methyl ethyl ketone) (MEK)	ug/L	400	< 20	< 20
2-Hexanone	ug/L	-	< 30	< 30
4-Methyl-2-pentanone (Methyl isobutyl ketone) (MIBK)	ug/L	-	< 20	< 20
Acetone	ug/L	-	< 30	< 30
Benzene	ug/L	100	< 0.50	< 0.50
Bromodichloromethane	ug/L	200	< 2.0	< 2.0
Bromoform	ug/L	60	< 1.0	< 1.0
Bromomethane (Methyl bromide)	ug/L	0.9	< 0.50	< 0.50
Carbon tetrachloride	ug/L	-	< 0.50	< 0.50
Chlorobenzene	ug/L	15	< 0.50	< 0.50
Chloroethane	ug/L	-	< 1.0	< 1.0
Chloroform (Trichloromethane)	ug/L	-	< 1.0	< 1.0
Chloromethane (Methyl chloride)	ug/L	700	< 1.0	< 1.0
cis-1,2-Dichloroethene	ug/L	200	< 0.50	< 0.50
cis-1,3-Dichloropropene	ug/L	-	< 0.50	< 0.50
Dibromochloromethane	ug/L	40	< 2.0	< 2.0
Ethylbenzene	ug/L	8	< 0.50	< 0.50
m&p-Xylenes	ug/L	2	< 1.0	< 1.0
Methyl tert butyl ether (MTBE)	ug/L	200	< 2.0	< 2.0
Methylene chloride	ug/L	100	< 5.0	< 5.0
o-Xylene	ug/L	40	< 0.50	< 0.50
Styrene	ug/L	4	< 0.50	< 0.50
Tetrachloroethene	ug/L	50	< 0.50	< 0.50
Toluene	ug/L	0.8	< 0.50	< 0.50
trans-1,2-Dichloroethene	ug/L	200	< 0.50	< 0.50
trans-1,3-Dichloropropene	ug/L	7	< 0.50	< 0.50
Trichloroethene	ug/L	20	< 0.50	< 0.50
Trichlorofluoromethane (CFC-11)	ug/L	-	< 5.0	< 5.0
Vinyl chloride	ug/L	600	< 0.50	< 0.50
Semi-volatile Organic Compounds				
1-Methylnaphthalene/2-Methylnaphthalene	ug/L	-	-	< 0.028
Acenaphthene	ug/L	-	< 0.020	< 0.020
Acenaphthylene	ug/L	-	< 0.020	< 0.020
Anthracene	ug/L	0.0008	**< 0.020**	**< 0.020**
Benzo(a)anthracene	ug/L	0.0004	**< 0.020**	**< 0.020**
Benzo(a)pyrene	ug/L	-	< 0.010	< 0.010
Benzo(b)fluoranthene	ug/L	-	< 0.020	< 0.020
Benzo(g,h,i)perylene	ug/L	0.00002	**< 0.020**	**< 0.020**
Benzo(k)fluoranthene	ug/L	0.0002	**< 0.020**	**< 0.020**
Chrysene	ug/L	0.0001	**< 0.020**	**< 0.020**
Dibenz(a,h)anthracene	ug/L	0.002	**< 0.020**	**< 0.020**
Fluoranthene	ug/L	0.0008	**< 0.020**	**< 0.020**
Fluorene	ug/L	0.2	< 0.020	< 0.020
Indeno(1,2,3-cd)pyrene	ug/L	-	< 0.020	< 0.020
Naphthalene	ug/L	7	< 0.050	< 0.050
Phenanthrene	ug/L	0.03	< 0.020	< 0.020
Pyrene	ug/L	-	< 0.020	< 0.020

Notes:

(1)	Water Management Policies, Guidelines, Provincial Water Quality Objectives, July 1994 (reprinted February 1999), prepared by MOECC.
-	No Value/Not Analyzed.
J	The result is an estimated value.
1.5	Does not meet the applicable PWQO Criteria.
<30	Method detection limit does not meet PWQO Criteria.
<30	Result below method detection limit .

TABLE OF CONTENTS

APPENDICES

1.0 OVERVIEW

The Brooks Road leachate treatment works provide wastewater treatment for the Brooks Road Landfill Site in Cayuga, Haldimand County, Ontario. The Works consist of a leachate collection sump, one (1) primary settling tank, an aeration system, a membrane bioreactor (MBR) treatment system, two (2) ultraviolet disinfection units, an effluent transfer tank, three (3) effluent discharge holding tanks, one (1) sludge storage tank, and a chemical addition system, all described in detail in amended Environmental Compliance Approval (ECA) Number 1122-BKUPSM issued February 3, 2021 (previously ECA No. 4142-ASEKJ2).

This report presents a summary of the annual monitoring results for the leachate treatment system (facility) only from January to December 2021. This excludes discussion of the dissolved air flotation (DAF) system and discharge from the effluent holding tanks, which were operated and controlled by others. It is noted that there was no Effluent Discharge to the Brooks Road ditch during the reporting period; all treated effluent was hauled offsite for disposal. In accordance with Condition 12(4) of the ECA, this report includes influent concentrations to the treatment facility, flow analysis, and a summary of facility maintenance and performance issues.

2.0 FACILITY MONITORING DATA

2.1 MONITORING PROGRAM

The monitoring program for the facility is described in detail in the ECA, including: Influent Leachate monthly and quarterly grab samples. There was no Effluent Discharge to the Brooks Road ditch during the reporting period, and therefore no Effluent sampling and flow measurements recorded. Continuous flow measurements were recorded by a magnetic flowmeter on the outlet (post-UV) from the treatment facility.

Samples were collected by the plant Operator, Clearford Waterworks, who is licensed in accordance with the conditions of O.Reg. 129/04. Samples were tested for the following parameters:

- Influent Leachate – (Monthly) $CBOD_5$, TSS, TAN, TP, pH, Zinc, Phenols, Ethylbenzene; (Quarterly) Chlorides, Nitrate (N), Arsenic, Barium, Boron, Chromium, Copper, Iron, Lead, Benzo(a)pyrene, Naphtalene, Benzene, Toluene.

Temperature and pH testing were performed at site by the Operator. All other parameter testing was conducted by Bureau Veritas and E3 Laboratories Inc., independent accredited laboratories. Samples were retained in laboratory-supplied coolers containing ice and transported to the laboratory for analysis. Chain of custody documents were provided for all samples.

2.2 SUMMARY & INTERPRETATION

The facility monitoring results for influent parameters and average flows are presented in the Tables below. There was no effluent discharge to the Brooks Road ditch, and therefore no effluent sampling results for the reporting period.

Influent Monitoring

In accordance with the ECA, influent leachate samples are collected from the sampling port on the effluent line from the primary settling tank flowing to the aeration tanks. Table 1 and Table 2 present the sampling results.

TABLE 1. SUMMARY OF MONTHLY INFLUENT PARAMETERS

PERIOD	INFLUENT LEACHATE								
Parameter (mg/L)	**$CBOD_5$**	**TSS**	**TP**	**TAN**	**Zinc**	**Phenols**	**EB[1]**	**pH**	**Temp (ºC)**

Notes:
1. Unit in µg/L
2. "<" denotes result below the analytical detection limit

Facility Flows

The facility has a design daily flow capacity of 200 m^3/day. Outlet flow from the treatment facility (not Effluent Discharge to the ditch) was measured by a continuous flowmeter, with daily flows summarized in Table 3 below and detailed data included in Appendix A.

The annual average flow was 41 m^3/day, and the maximum day flow was 88 m^3/day occurring in June 2021. The recorded daily flows did not exceed the rated capacity during the reporting period. There were 24 days with zero flow as a result of plant maintenance, repairs and replacements, and quality assurance activities.

TABLE 3. MONTHLY AVERAGE AND MAXIMUM DAILY TREATMENT FACILITY FLOWS

PERIOD	MONTHLY AVG. FLOW (m^3/d)	MAX. DAY FLOW (m^3/d)
January	35.44	62.34
February	34.62	60.69
March	16.19	23.41
April	14.93	28.75
May	30.63	73.84
June	48.22	87.67
July	47.89	70.95
August	49.91	72.13
September	46.42	68.96
October	49.19	77.90
November	57.40	72.23
December	57.65	70.17
Annual	**40.75**	**87.67**

3.0 OPERATING PROBLEMS & CORRECTIVE ACTIONS

Table 4 lists the operational challenges along with their remediation steps. All equipment issues were dealt with in a timely manner and did not affect the long-term performance of the plant.

TABLE 4. OPERATIONAL PROBLEMS AND CORRECTIVE ACTIONS

DATE	OPERATIONAL CHALLENGE	CORRECTIVE ACTION
Jan-2021	MBR #3 constant auto-priming, all MBRs in high trans-membrane pressure, not addressed by clean-in-place	Inspection of MBR cassettes, membrane recovery clean, removed damaged sheets and ordered replacement sheets (installed Apr-2021)
Feb-2021	Plant effluent elevated Ammonia and Orthophosphate (field measurement)	Stopped effluent production and recirculated through AT1 & AT2 – improved results observed
Mar-2021	HMI failure	PLC card replaced

DATE	OPERATIONAL CHALLENGE	CORRECTIVE ACTION
Mar-2021	MBR tank levels constantly high	Cleared solids build-up from overflow line at MBR #1, outside line to AT2 and main line into plant – level returned to normal
Apr-2021	MBR #1 feed flowmeter not recording (zero) causing issues with automated valve and permeate pump	Tightened flowmeter piping, PLC programming adjusted
Apr-2021	Plant effluent and AT2 elevated Ammonia and Orthophosphate (field measurement)	Recirculated flow and reseeded biomass in AT1 – improved results observed
May-2021	Plant shutting down because of MBR #2 feed flow control valve position error alarm	New PLC card required – running valve in manual mode
May-2021	AT1 and AT2 elevated Ammonia and Orthophosphate (field measurement)	Wasted effluent to sludge tank, DAF offline until Ammonia lowered, recirculated flow in AT1 and AT2 – improved results observed
May-2021	MBR #1 permeate pump constantly auto-priming/air-locking	Inspected piping inside tank
May-2021	DAF potable water pressure tank failed, DAF and MBRs offline	Owner replaced PSI tank
Jun-2021	Plant effluent, AT1 and AT2 elevated Ammonia and Orthophosphate (field measurement)	Drained MBR tank to sludge tank and refilled, aerated and recirculated flow in AT1 and AT2 – improved results observed
Jun-2021	MBR #2 blower fault, MBR #1 permeate pump air-locking	Motor wiring fixed, reconnected pipe to manifold inside tank
Jul-2021	Heavy sludge in MBR tank and AT2	Ran overflow valve to AT1 and drained MBR tanks to sludge tank
Jul-2021	MBR #1 permeate pump VFD and motor thermal fault	Adjust pump speed, reset alarm and monitor if recurring
Jul-2021	MBR #2 permeate valve not working, PLC card issue, plant shutdown	Technician resolved air compressor problem, recommended replacement
Sep-2021	Plant effluent and AT2 elevated Ammonia (field measurement)	Stop MBR production, recirculate effluent in AT2 until resolved.
Sep-2021	AT2 effluent elevated solids to MBRs	Pump out sludge from AT1 and refilled with AT2 effluent with elevated solids

DATE	OPERATIONAL CHALLENGE	CORRECTIVE ACTION
Nov-2021	Plant effluent, AT1 and AT2 elevated Ammonia (field measurement)	Stop DAF and MBR production, Recirculate AT2 effluent, and continued aeration of AT1 until resolved.
Dec-2021	AT1 and AT2 elevated Ammonia (field measurement)	Stop DAF and MBR production, recirculate AT2 effluent, continue aeration of AT1 until resolved

4.0 FACILITY & EQUIPMENT MAINTENANCE

Regular and preventative maintenance performed during the reporting period included:

- Checks and maintenance on blowers, air filters and oil levels;
- Checks and maintenance on chemical pumps, tubes, injector valves;
- Checks and maintenance on instrumentation and controls;
- Cleaning and calibrating pH probes;
- Cleaning effluent booster pump and pump strainer;
- Replacement of UV disinfection unit lamps; (no UV lamp replacement in 2021. 2 new ballast are needed with new lamps for both units)
- Inspection of membrane modules;
- Cleaning and reconditioning of membranes.

Repairs, replacements and special maintenance undertaken during the reporting period included:

- January – Membrane recovery clean, inspection, and removal of some damaged membrane cassettes;
- January – Replaced MBR #3 permeate pump;
- February – Membrane recovery clean, calibration of gas monitor;
- March – New UPS installed in control panel;
- April – Installed replacement membrane cassettes in frames;
- May – Replaced MBR #1 and #2 permeate pumps, identified need for repair feed flowmeter MBR #1 (not approved while considering future changes), biomass seeding in AT1 tank, installed new fuses for MBR #1 and #2 recirculation pumps, Owner replaced DAF water PSI tank;
- June – Replaced PLC card in control panel, membrane inspection and recovery clean;
- July – Owner replaced DAF water pump, membrane recovery clean, installed new overflow line from MBR tanks to AT2, ordered replacement propeller for chemical tank mixer;
- August – Replaced air compressor for automated valves;
- September – Replaced air compressor with a higher capacity unit;
- October – Membrane inspection and recovery clean, replaced four (4) membrane sheets, removed MBR #1 feed flowmeter for repairs;
- December – Ordered replacement MBR feed pump, replaced chlorine pump #3 tubing.

5.0 EFFLUENT QUALITY ASSURANCE

The facility Operator undertook regular quality assurance activities during the reporting period to ensure adequate treatment plant operation and effluent quality, including field measurements for phosphates, ammonia, pH, dissolved oxygen, and temperature of the process stream, sludge settleability testing, and monitoring of chemical dosages and sludge wasting volumes. Non-regulatory operational sampling was also conducted with weekly grab samples from the treatment facility outlet (post-UV) analyzed by independent accredited laboratories.

The necessary instrumentation required to perform the in-house analysis of various parameters was available to the facility Operators. All sampling and analyses were performed in accordance with the "*Procedures for Sampling and Analysis Requirements for Municipal and Private Sewage Treatment Works*", "*Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater*", "*Standard Methods for Examination of Water and Wastewater*", and Environment Canada publications for biological test methods for acute lethality.

The Operator followed the recommendations and procedures outlined in the facility Operations & Maintenance Manual. Data was recorded in the facility logbook and monitored for changes. When appropriate, the Operator made adjustments to the treatment processes and took corrective actions towards ensuring that the effluent quality met the objectives for the facility.

When elevated operational parameters were observed from the treatment system, the Operator took corrective action to cease plant production and recirculate flows through the MBR, AT1 and AT2 tanks for additional aeration and treatment until improved water quality was observed.

6.0 MONITORING EQUIPMENT CALIBRATION & MAINTENANCE

No calibration or maintenance was performed on the facility discharge flowmeter, which is factory-calibrated and does not require annual re-calibration.

7.0 RESULTS FOR EFFLUENT OBJECTIVES

The operational efforts made during the reporting period as described in the Sections above generally achieved the operational objectives for the facility. The results for the complete DAF system and effluent holding tanks are discussed by others. There was no effluent discharged to the Brooks Road ditch; all treated effluent was hauled off-site for disposal.

8.0 SLUDGE MANAGEMENT

There was no sludge hauled off-site for disposal during the reporting period. Waste sludge is sent to the sludge tank which pumps back to the landfill cells.

9.0 COMPLAINTS

There were no complaints received by the Operator from the public during the reporting period.

10.0 BY-PASSES, SPILLS & ABNORMAL DISCHARGES

There were no by-passes or abnormal discharge events during the reporting period. Treated effluent was hauled off-site for disposal at the Haldimand Wastewater Treatment Plant.

11.0 NOTICES OF MODIFICATION

No Notices of Modification were submitted to the District Manager during the reporting period related to Limited Operational Flexibility of the sewage works.

12.0 OTHER REQUESTED INFORMATION

No additional information was requested by the District Manager during the reporting period. It is noted that an investigation was initiated by MECP in 2021. The Operating Authority (Clearford Waterworks) is voluntarily cooperating to provide additional requested information regarding the operation of the leachate treatment facility. Additionally, facility inspection by the District MECP was conducted on November 24, 2021.

13.0 SUMMARY

Performance of the complete leachate DAF system and effluent holding tanks was controlled by others and is discussed separately. During the reporting period, there was no effluent discharged to the Brooks Road ditch; all treated effluent was hauled off-site for disposal. The facility generally achieved good operational effluent quality as a result of regular effluent quality assurance activities. The average daily sewage flow was consistently below the rated capacity for the facility, and the treatment performance was not negatively affected when higher daily flows occurred. Regular and preventative maintenance activities were undertaken, and operational challenges were dealt with in a timely manner with special maintenance, repairs and replacement of facility components as required.

It is anticipated that the facility will continue to achieve adequate treatment and operational performance during the next reporting period.

Appendix I

Trigger Level Program

Table of Contents

1. Introduction

GHD has prepared this recommended groundwater Trigger Level Program (TLP) and Contingency Response Plan (CRP) for the Brooks Road Landfill (Site). The TLP and CRP were developed to meet the requirements of Condition 56 of Environmental Compliance Approval (Number A110302) (ECA) which states that the owner "shall develop a comprehensive Compliance and Trigger Level Monitoring Program, based on the surface water, groundwater and leachate database established for the Site". The TLP has been developed in consideration of the Site regulatory setting, hydrologic and hydrogeologic conditions, surrounding land uses, potential groundwater uses, and background groundwater and surface water quality.

The purpose of the TLP is to provide timely identification of potential Site-related water quality impairment and in turn permit implementation of appropriate contingency measures to mitigate the potential for non-compliance. The following Sections outline the recommended Site-specific TLP and CRP. The groundwater TLP presented herein was developed in a manner such that sustained concentrations in excess of the Reasonable Use Concept (Guideline B-7, MOEE, April 1994) (RUC) criteria are not reached at the downgradient Site boundaries, prior to implementation of the appropriate contingency measure(s). The surface water TLP presented herein was developed in a manner such that surface water runoff from the Site does not impair background surface water quality.

2. Groundwater Trigger Level Program

The following Site-specific tiered TLP and CRP have been developed in order to define appropriate action levels and trigger mechanisms for identifying potential and /or actual off-Site environmental degradation of groundwater due to landfilling activities. A multi-tiered TLP with defined groundwater trigger wells, trigger parameters, and trigger concentrations has been developed consistent with the three-tiered system outlined in the MOE's Interim Guidance Document entitled "Surface Water Monitoring Trigger Mechanism For Waste Disposal Sites" (MOE, March 1998). Although this mechanism was originally developed for surface water evaluations, the three-tiered system described in this document provides an appropriate approach for identifying, confirming and responding to groundwater quality compliance issues at landfill sites.

The following section describes the three tiers of monitoring included in the TLP. Trigger parameters and levels are discussed in Section 2.2. The recommended trigger locations are summarized in Section 2.3.

2.1 Trigger Level Program - Tiers

The following paragraphs describe the three Tiers of the TLP.

Tier I – Routine Monitoring and Trigger Locations

The first tier of the TLP monitoring consists of the routine monitoring included in the regular groundwater monitoring program for the Site. Groundwater monitoring at the Site is conducted two

times per year for the comprehensive list of analytical parameters included in the regular monitoring program. Samples are collected from groundwater monitoring wells and analyzed for the complete list of monitoring analytes, including the proposed trigger parameters (discussed in Section 2.2).

Analytical results for each trigger well are compared to the established trigger levels as part of the Tier I monitoring activities. The comparison of sample analytical results to the trigger levels determines if each individual well will continue with Tier I monitoring or move to Tier II monitoring during the subsequent monitoring event.

There are no additional monitoring requirements or contingency actions necessary while monitoring wells are being sampled under Tier I monitoring.

Tier II – Confirmation Monitoring

If a trigger parameter concentration exceeds an established trigger level at a trigger location in two consecutive sampling events, the Tier II Confirmation Monitoring program will be implemented. The Tier II Confirmation Monitoring program consists of collecting a confirmatory water quality sample from the location exhibiting the Tier I exceedance during a follow-up monitoring event in order to confirm the Tier I exceedance of the trigger parameter. If the sample collected during the follow-up monitoring event indicates that Tier I trigger concentrations are not being exceeded then Tier I monitoring will resume.

If the Tier I exceedance is confirmed, then the next step in the Tier II Confirmation Monitoring program will be to evaluate the degree, nature, and potential source(s) of water quality impact(s) resulting in Tier I exceedance. The implications of the Tier 1 exceedances in terms of compliance with the RUC (MOE Guideline B-7), as well as the potential for downgradient off-Site impacts should be given consideration in the evaluation.

The Tier II evaluation will include comparison of the observed water quality to the generic criteria and the applicable regulatory compliance framework. The comparison will be utilized in determining the appropriate timing and urgency of response. The comparison will also include parameter trend analyses over time and the potential for contributions of sources of impact other than the landfill. If the Tier II Confirmation Monitoring program and subsequent evaluation indicate that Site derived water quality impacts are or will result in an off-Site water quality compliance issue then Tier III - contingency measures will be implemented.

Tier III – Contingency Measures and Compliance Monitoring

The Tier III portion of the TLP involves implementation and subsequent performance assessment of the necessary contingency measures. Tier III is implemented in the event that Tier II monitoring confirms a groundwater non-conformance.

Tier III includes ongoing monitoring to assess the effectiveness of any contingency measures that have been implemented until such time that the contingency measures are deemed no longer necessary. The Tier III compliance monitoring program details would be determined in conjunction with the development and implementation of preferred contingency measure(s). The compliance monitoring parameters, locations and monitoring frequency would be determined at the time of implementation of contingency measures. Exact contingency measures should be evaluated after Tier I exceedances are confirmed through the Tier II Confirmatory Monitoring program and after a

Tier II evaluation confirms that contingency measures are warranted. As the nature of potential future water quality impairment and associated non-compliance issues cannot be predicted in advance, it is not practical to identify specific remedial or contingency plans for implementation that will necessarily best suit the particular situation in the event of a potential or actual non-compliance. Potential alternative contingency plans that are practical and implementable are provided in Section 4 for consideration in the event of a potential or actual non-compliance.

2.2 Trigger Parameters and Levels

Groundwater compliance at the Site is determined through a comparison of Site boundary groundwater quality to Site-specific RUC criteria, which are calculated from generic ODWS and background concentrations. For the purposes of the trigger level program, 85 percent of Site-specific RUC criteria will be calculated for each trigger parameter and the calculated concentration will be utilized as the Tier I Trigger Level.

ODWS Operation Guidelines (OG) criteria have not been included the list of Trigger Parameters as these criteria apply to the operation of water treatment facilities and do not relate to groundwater sampled from monitoring wells.

As previously mentioned concentrations of several parameters are present within the upgradient groundwater at elevated concentrations. Background groundwater quality within the shallow aquifer and basal till/bedrock aquifer units is generally poor and characterized by elevated sulphate, TDS, iron, sodium, alkalinity and hardness. As these parameters are naturally elevated in groundwater at the Site, it is not appropriate to use these parameters in the Trigger Level Program. It should be noted that the ODWS criteria for alkalinity and hardness are OGs and as such, these parameters are not included in the program as Trigger Parameters.

The following table summarizes the 2014 concentration ranges for sulphate, TDS, iron and sodium in background (upgradient) monitoring wells within the shallow overburden aquifer.

Location	ODWS (mg/L)	2014 Concentration Range (mg/L)
OW1B-13		
Sulphate	500	1370 - 1550
TDS	500	2520 – 2650
Iron	0.3	1.78
Sodium	20/200	136 – 144
OW3B-13		
Sulphate	500	263 – 359
TDS	500	677 – 837
Iron	0.3	<0.50
Sodium	20/200	29.9 – 37.6
OW9B-06		
Sulphate	500	489 – 525
TDS	500	1230 – 1280
Iron	0.3	<0.50
Sodium	20/200	133 – 153

The following table summarizes the 2014 concentration ranges for sulphate, TDS, iron and sodium in background (upgradient) monitoring wells within the basal till/bedrock aquifer.

Location	ODWS (mg/L)	2014 Concentration Range (mg/L)
OW1A-13		
Sulphate	500	3620 - 4400
TDS	500	6030 – 6680
Iron	0.3	<0.50
Sodium	20/200	615 – 826
OW3B-13		
Sulphate	500	2180 – 2580
TDS	500	3830 – 3960
Iron	0.3	<0.50
Sodium	20/200	170 - 186
OW9B-06		
Sulphate	500	489 – 525
TDS	500	1230 – 1280
Iron	0.3	<0.50
Sodium	20/200	116 – 123

Although the concentrations of iron reported during 2014 (presented above) were not detected above the reporting limit, the reporting limit (0.5 mg/L) was consistently above the ODWS for iron (0.3 mg/L). Iron has frequently been reported above the ODWS in background monitoring wells during historical monitoring.

Quantitatively comparing concentrations of analytes that are elevated upgradient of the landfill can be useful for evaluating the effects of landfilling on downgradient water quality; however it is not appropriate to calculate Site-specific trigger levels for these parameters based on RUC criteria. For this reason these parameters (sulphate, TDS, iron and sodium) have been omitted from the trigger level program.

Based on the above, and in consideration of historic landfill practices, the following list of selected analytes is considered appropriate for inclusion in the Trigger Level Program.

General Chemistry	Metals	PAHs(1)	VOCs(2)
Chloride	Boron	Naphthalene	Benzene
	Chromium	Phenanthrene	Ethylbenzene
	Lead	Pyrene	Toluene
		Benzo(a)pyrene	

Notes:
(1) Polycyclic Aromatic Hydrocarbons
(2) Volatile Organic Compounds

The above listed parameters include those included in the interim TLP developed for the Site as part of the hydrogeologic investigation completed by CRA in 2004 (CRA, 2004) as well as two additional analytes requested by the MOE (benzo(a) pyrene, chloride) in correspondence related to the monitoring program in 2007.

Tables 1 and 2 provide summaries of the background concentrations, leachate concentrations, calculated RUC criteria, and recommended trigger levels for the above listed parameters for the shallow overburden aquifer and the basal till/bedrock aquifer, respectively.

2.3 Trigger Locations

Groundwater monitoring locations located along the downgradient Site boundaries are appropriate for inclusion in the TLP as trigger wells. The following table summarizes the monitoring wells proposed for inclusion in the TLP, along with the respective unit in which each well is completed.

Location	Unit
MW1B-06	Shallow Overburden
MW2C-01**	Shallow Overburden
MW2B-07	Shallow Overburden
MW5B-06	Shallow Overburden
MW8B-06	Shallow Overburden
MW10B-18	Shallow Overburden
MW11B-19*	Shallow Overburden
MW12B-19*	Shallow Overburden
MW1A-06	Basal OB/Shallow BR
MW2A-01	Basal OB/Shallow BR
MW5A-06	Basal OB/Shallow BR
MW8A-06	Basal OB/Shallow BR
MW10A-18	Basal OB/Shallow BR
MW11A-19*	Basal OB/Shallow BR
MW12A-19*	Basal OB/Shallow BR

* - recommended additional monitoring well location.

** - monitoring well removed from the monitoring program

Monitoring well nests MW11A/B-19 and MW12A/B-19 are recommended for installation along the southern boundary at the locations illustrated on Drawing L-C-06. It is recommended that monitoring well nests are included in the long-term monitoring program and TLP following installation. These monitoring well nests will reduce the gaps between monitoring points along the downgradient Site boundary and will thus provide more comprehensive monitoring of Site compliance.

Investigations into the deeper bedrock aquifer have been undertaken at the Site for the purpose of evaluating the potential effects of gypsum mining in the vicinity of the Site. The results of these investigations have indicated that there is no evidence of landfill-related water quality impacts to the deeper bedrock aquifer. Further, in light of the existence of two flow zones and a significant overburden aquitard between the landfilled waste and the deeper bedrock aquifer, it is considered extremely unlikely that this flow zone could become impacted by leachate. For this reason deeper bedrock aquifer monitoring wells have not been included in the TLP.

3. Surface Water Trigger Level Program

The Site-specific surface water TLP is defined in the Industrial Sewage ECA No. 4142-ASEKJ2.

The trigger parameters include:

Table 7 – Trigger Parameters	
Parameter	Trigger Level (mg/L)
Un-ionized Ammonia	0.02
Arsenic	0.005
Boron	0.2
pH (unitless)	6.5 to 8.5

Samples collected from the stormwater management system(s) for routine monitoring and reporting will be compared to the trigger levels.

The following conditions have been reproduced from the Industrial Sewage ECA No. 4142-ASEKJ2 that describe the actions to be taken as a result of a trigger level exceedance:

10(12) In the event that a monitoring result for any of the parameters listed in Table 7 exceeds its corresponding trigger level concentration, the Owner shall re-sample within two weeks period to confirm the trigger level concentration exceedance for that parameter;

10(13) In the event that the trigger level concentration exceedance of any parameter of concern is not confirmed after the second round of sampling conducted under Condition 10 (12), then, normal stormwater monitoring shall be resumed;

*10(14) In the event that the trigger level concentration exceedance of any parameter of concern is confirmed after the second round of sampling conducted under Condition 10 (12), the Owner shall operate the Works in a **normally closed position** and notify the District Manager forthwith;*

*10(15) While operating the Works in a **normally closed position**, the Owner shall implement the "Stormwater Contingency and Remedial Action Plan" prepared under Condition 10 (10) and collect a grab sample and analyze for the trigger parameters listed under Condition 10 (11) at a **weekly frequency** preferably after a rainfall event;*

*10(16) The Owner shall resume operating the Works in a **normally open position** if monitoring results for all trigger parameters from three (3) consecutive sampling events conducted under Condition 10 (15) are less than their respective trigger level concentrations;*

(17) Discharge of contaminated stormwater from the Works to storm sewer/surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage;

If amended, the trigger level program in the Industrial Sewage ECA No. 4142-ASEKJ2 will supersede the conditions reproduced above.

4. Contingency Response Plan

As discussed in Section 2.1 and Section 3.0, an evaluation of potential contingency measures should be undertaken if Tier I exceedances are confirmed through and after a Tier II reassessment of the analytical results shows that contingency measures are warranted. As the nature of potential future non-compliance issues cannot be known in advance, it is not appropriate to identify specific remedial or contingency plans for implementation that will necessarily best suit the particular situation in the event of a potential or actual non-compliance.

Potential contingency or remedial action plans that could be implemented in the event of verified groundwater non-conformance include: acquisition of additional property downgradient, registration of downgradient property as contaminant attenuation zone, construction and operation of groundwater migration controls, or implementation of leachate mitigation measures (cap improvements, cut-off wall, etc.).

Examples of potential contingency or remedial action plans that could be implemented in the event of verified surface water non-conformance include: closure of the stormwater management pond discharge valve followed by monitoring and manual discharge of collected surface water until impacts are no longer identified, evaluation of landfill final cover to identify and repair potential leachate seeps or sediment migration, or implementation of other site controls if the surface water is determined to be impacting the water quality in the receiving downstream ditches.

Telephone No:	(365) 336-7491	**Fax Number:**	(905) 521-7806
E-mail:	taylor.buck@ontario.ca		
Address:	119 KING ST W 9TH FLR, HAMILTON, ON, L8P 4Y7		

Signature:		**Badge No:**	1681
Notice served upon:	TIM DANYLIW	**Date: (yyyy/mm/dd)**	2021/12/17

Please note that this notice is a formal notification that the issuing Provincial Officer believes that you have violated provincial environmental law. This notice will remain on your ministry's file in respect to the inspection location(s) noted above and is available to the public subject to the provisions of the *Freedom of Information and Protection of Privacy Act*.

Details of the violation(s) including the applicable section(s) of the legislation are included in this Notice along with the required compliance action item(s) and the required action completion date(s).

Issuance of this Notice in no way precludes the issuance of any orders or prosecution of any person for an offence.

Inquiries regarding this Notice should be directed to the issuing Provincial Officer or the Manager of the Ministry office as shown on the Notice.

The statutes listed above, and corresponding regulations are available on the Ontario statutes and regulations website at https://www.ontario.ca/laws

Appendix K

Public Complaints Procedure

PUBLIC COMPLAINT PROCEDURE
BROOKS ROAD LANDFILL
160 Brooks Road, Cayuga Ontario
Approved December 2004

Certificate of Approval No. A110302

As required by Condition 90 of Certificate of Approval No. A110302 the following complaint procedure has been drafted to establish a process for complaints from the public regarding the operation and maintenance of the Brooks Road Landfill (Site). The purpose of this procedure is to establish a clear process for residents to voice any concerns they may have with respect to operating issues at the Site. The following steps outline the various avenues the public may follow to lodge any complaint resulting from operations at the Site.

1) During regular hours of operation, **6:00am to 6:00pm (Monday to Friday) and 6:00am to 2:00pm (Saturdays)** any complaints should be made directly to the Site by calling 905-772-3040. The Site Supervisor on duty at the time will ensure the issue is dealt with immediately. Alternatively, complainants may choose to visit the Site in person and speak directly to the Site supervisor during the above noted regular hours of operation.

2) Outside regular hours of operation, a voice message system will be available to receive complaints. In cases of emergency, residents should call 911 so that appropriate action(s) can be taken.

3) When making a complaint, residents should be prepared to provide the following information:

    - Date and time;
    - Resident's name;
    - Resident's Address;
    - Location relative to the Site;
    - Contact information (e.g. telephone number);
    - Nature of the complaint; and
    - Weather conditions at the time of the complaint.

    (Weather conditions will be documented to determine if weather was a contributing factor to the complaint, e.g. litter impacts can be associated with periods of high winds, or odour impacts can be associated with overcast periods with little wind).

Complaint forms will be completed and logged by Brooks Road Environmental (BRE) when a complaint has been received. This will be undertaken for all complaints, whether written or verbal. These forms will provide a record to be kept on file, along with copies of any correspondence to, or discussion with, the complainant. Members of the Public Liaison Committee (PLC) will receive a copy of each complaint made.

A response will be made to the complainant by the end of the next business day confirming the receipt of the complaint, the nature of the complaint, and results of any follow-up. If the complaint cannot be resolved within a reasonable time period, the complainant will be notified of the action to be taken and timing.

As per C of A No. A110302, Condition 74(g), appropriate signage will be placed at the Site entrance/exit indicating the overview of the Public Complaint Procedure, including a phone number for registering any complaint. Phone numbers for the Ministry of the Environment (MOE) Hamilton District office and Haldimand County By-law enforcement will also be included on the signs.

MOE District Office:
Brad Farnand, Senior Environmental Officer
905-521-7765

Haldimand County By-law Enforcement:

Appendix M

Landfill Monitoring and Screening Checklist

Appendix D-Monitoring and Screening Checklist
General Information and Instructions

General Information: The checklist is to be completed, and submitted with the Monitoring Report.
Instructions: A complete checklist consists of:
(a) a completed and signed checklist, including any additional pages of information which can be attached as needed to provide further details where indicated.
(b) completed contact information for the Competent Environmental Practitioner (CEP)
(c) self-declaration that CEP(s) meet(s) the qualifications as set out below and in Section 1.2 of the Technical Guidance Document.

Definition of Groundwater CEP:
For groundwater, the CEP must have expertise in hydrogeology and meet one of the following:
(a) the person holds a licence, limited licence or temporary licence under the *Professional Engineers Act*; or
(b) the person holds a certificate of registration under the *Professional Geoscientists Act, 2000* and is a practicing member, temporary, member or limited member of the Association of Professional Geoscientists of Ontario. O. Reg. 66/08, s. 2..
Definition of Surface water CEP:
A CEP for surface water assessments is a scientist, professional engineer or professional geoscientist as described in (a) and (b) above with demonstrated experience and post-secondary education, either a diploma or degree, in hydrology, aquatic ecology, limnology, aquatic biology, physical geography with specialization in surface water, and/or water resource management.

The type of scientific work that a CEP performs must be consistent with that person's education and experience. If an individual has appropriate training and credentials in both groundwater and surface water and is responsible for both areas of expertise, the CEP may then complete and validate both sections of the checklist.

Monitoring Report and Site Information	
Waste Disposal Site (WDS) Name	Brooks Road Landfill Site
Location (e.g. street address, lot, concession)	160 Brooks Road
GPS Location (taken within the property boundary at front gate/ front entry)	UTM easting 595435.5, UTM northing 4757794.7
Municipality	Haldimand County
Client and/or Site Owner	2270386 Ontario Limited
Monitoring Period (Year)	2021
This Monitoring Report is being submitted under the following:	
Environmental Compliance Approval (ECA) Number (formerly "Certificate of Approval" (C of A)) :	A110302
Director's Order No.:	none
Provincial Officer's Order No.:	none

Other:	Industrial Sewage ECA No. 4142-ASEKJ2		
Report Submission Frequency	(•) **Annual** ( ) **Other**	annual	
The site is: **(Operation Status)**	(•) **Open** ( ) **Inactive** ( ) **Closed**		
Is there an active waste transfer station at the site?	( ) **Yes** (•) **No**		
Does this WDS have a Closure Plan?	(•) **Not yet submitted** ( ) **Submitted and under review** ( ) **Submitted and approved**		
Total Approved Capacity	1,045,065	*Units*	Cubic Metres
Maximum Approved Fill Rate	1,000	*Units*	Tonnes per Day
Total Waste Received within Monitoring Period (Year)	183,977	*Units*	Tonnes
Total Waste Received within Monitoring Period (Year) *Describe the methodology used to determine this quantity*	weighed		
Estimated Remaining Capacity	180,553	*Units*	Cubic Metres

Estimated Remaining Capacity *Date Last Determined*	Dec 17, 2021		
Non-Hazardous Approved Waste Types	☐ Domestic ☒ Industrial, Commercial & Institutional (IC&I) ☐ Source Separated Organics (Green Bin) ☐ Tires	☒ Contaminated Soil ☐ Wood Waste ☐ Blue Box Material ☒ Processed Organics ☐ Leaf and Yard Waste	☐ Food Processing/Preparation Operations Waste ☐ Hauled Sewage Other:
Subject Waste Approved Waste Classes: Hazardous & Liquid Industrial *(separate waste classes by comma)*	none		

Year Site Opened *(enter the Calendar Year only)*	1980	**Current ECA Issue Date**	27-Mar-20
Is your Site required to submit Financial Assurance?		◉ **Yes** ○ **No**	
Describe how your WDS is designed.		○ Natural Attenuation only ◉ Fully engineered Facility ○ Partially engineered Facility	
Does your Site have an approved Contaminant Attenuation Zone?		○ **Yes** ◉ **No**	
If closed, specify ECA, control or authorizing document closure date:		Select Date	
Has the nature of the operations at the site changed during this monitoring period?	○ **Yes** ◉ **No**		
If yes, provide details:	Type Here		

Have any measurements been taken since the last reporting period that indicate landfill gas volumes have exceeded the MOE limits for subsurface or adjacent buildings? (i.e. exceeded the LEL for methane)	○ Yes ◉ No

Groundwater WDS Verification:

Based on all available information about the site and site knowledge, it is my opinion that:

Sampling and Monitoring Program Status:

1) The monitoring program continues to effectively characterize site conditions and any groundwater discharges from the site. All monitoring wells are confirmed to be in good condition and are secure:	◉ **Yes** ○ **No**	If no, list exceptions (Type Here):
2) All groundwater, leachate and landfill gas sampling and monitoring for the monitoring period being reported on was successfully completed as required by ECA or other relevant authorizing/ control document(s):	○ **Yes** ◉ **No** ○ **Not Applicable**	If no, list exceptions below or attach information.

Groundwater Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
MW1A-07 MW4A-09 MW5A-09 MW5B-09	Blocked (November 2021) Dry/Insufficent Volume (November 2021) Not monitored (November 2021) Not monitored (November 2021)	June and November 2021
Gas Probes	Several gas probes were flooded as noted in Section 5.7 of the 2021 Operations and Monitoring Report	'2020

3) a) Some or all groundwater, leachate and landfill gas sampling and monitoring requirements have been established or defined outside of a ministry ECA, authorizing, or control document.	◯ **Yes** ◉ **No** ◯ **Not Applicable**	
b) If yes, the sampling and monitoring identified under 3(a) for the monitoring period being reported on was successfully completed in accordance with established protocols, frequencies, locations, and parameters developed as per the Technical Guidance Document:	◯ **Yes** ◯ **No** ◉ **Not Applicable**	If no, list exceptions below or attach additional information.

Groundwater Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date

4) All field work for groundwater investigations was done in accordance with Standard Operating Procedures (SOP) as established/outlined per the Technical Guidance Document (including internal/external QA/QC requirements) (Note: A SOP can be from a published source, developed internally by the site owner's consultant, or adopted by the consultant from another organization):	(●) **Yes** ( ) **No**	If no, specify (Type Here):
Sampling and Monitoring Program Results/WDS Conditions and Assessment:		
5) The site has an adequate buffer, Contaminant Attenuation Zone (CAZ) and/ or contingency plan in place. Design and operational measures, including the size and configuration of any CAZ, are adequate to prevent potential human health impacts and impairment of the environment.	(●) **Yes** ( ) **No**	If no, the potential design and operational concerns/exceptions are as follows (Type Here):
6) The site meets compliance and assessment criteria.	( ) **Yes** (●) **No**	As per Section 9.0 of the 2021 Operations & Monitoring Report.
7) The site continues to perform as anticipated. There have been no unusual trends/ changes in measured leachate and groundwater levels or concentrations.	( ) **Yes** (●) **No**	The Site performs as anticipated, however the following parameter concentrations were elevated above the RUC in the shallow overburden groundwater unit: chloride, boron and benzo(a)pyrene at OW8B-06.

1) Is one or more of the following risk reduction practices in place at the site: ***(a)*** **There is minimal reliance on natural attenuation of leachate due to the presence of an effective waste liner and active leachate collection/ treatment; or** ***(b)*** **There is a predictive monitoring program in-place (modeled indicator concentrations projected over time for key locations); or** ***(c)*** **The site meets the following two conditions (typically achieved after 15 years or longer of site operation):** ***i.*** **The site has developed stable leachate mound(s) and stable leachate plume geometry/ concentrations; and** ***ii.*** **Seasonal and annual water levels and water quality fluctuations are well understood.**	◉ **Yes** ○ **No**	**Note which practice(s):**	☒ **(a)** ☒ **(b)** ☐ **(c)**
9) Have trigger values for contingency plans or site remedial actions been exceeded (where they exist):	◉ **Yes** ○ **No** ○ **Not Applicable**	Trigger values have been exceeded for chloride, boron, and benzo(a)pyrene at OW8B-06 as outlined in Section 6.1.2 of the 021 Operations & Monitoring Report.	

Groundwater CEP Declaration:

I am a licensed professional Engineer or a registered professional geoscientist in Ontario with expertise in hydrogeology, as defined in Appendix D under Instructions. Where additional expertise was needed to evaluate the site monitoring data, I have relied on individuals who I believe to be experts in the relevant discipline, who have co-signed the compliance monitoring report or monitoring program status report, and who have provided evidence to me of their credentials.

I have examined the applicable Environmental Compliance Approval and any other environmental authorizing or control documents that apply to the site. I have read and followed the Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document (MOE, 2010, or as amended), and associated monitoring and sampling guidance documents, as amended from time to time. I have reviewed all of the data collected for the above-referenced site for the monitoring period(s) identified in this checklist. Except as otherwise agreed with the ministry for certain parameters, all of the analytical work has been undertaken by a laboratory which is accredited for the parameters analysed to *ISO/IEC 17025:2005 (E)- General requirements for the competence of testing and calibration laboratories,* or as amended from time to time by the ministry.

If any exceptions or potential concerns have been noted in the questions in the checklist attached to this declaration, it is my opinion that these exceptions and concerns are minor in nature and will be rectified for the next monitoring/reporting period. Where this is not the case, the circumstances concerning the exception or potential concern and my client's proposed action have been documented in writing to the Ministry of the Environment District Manager in a letter from me dated:

Select Date

Recommendations:

Based on my technical review of the monitoring results for the waste disposal site:

◉ **No changes to the monitoring program are recommended** ○ **The following change(s) to the monitoring program is/ are recommended:**	
◉ **No Changes to site design and operation are recommended** ○ **The following change(s) to the site design and operation is/are recommended:**	Type Here

Surface Water WDS Verification:

Provide the name of surface water body/bodies potentially receiving the WDS effluent and the approximate distance to the waterbody (including the nearest surface water body/bodies to the site):	
Name (s)	Grand River

Distance(s)	Grand River is approximately 7 km southwest

Based on all available information and site knowledge, it is my opinion that:

Sampling and Monitoring Program Status:

1) The current surface water monitoring program continues to effectively characterize the surface water conditions, and includes data that relates upstream/background and downstream receiving water conditions:	(●) **Yes** ( ) **No**	If no, identify issues (Type Here):
2) All surface water sampling for the monitoring period being reported was successfully completed in accordance with the ECA or relevant authorizing/control document(s) (if applicable):	( ) **Yes** (●) **No** ( ) **Not applicable**	If no, specify below or provide details in an attachment.

Surface Water Sampling Location	**Description/Explanation for change (change in name or location, additions, deletions)**	**Date**
SW1 SW2 SW4 SW5	Dry/insufficient volume	June 2021
SW3	Dry/insufficient volume	August and November 2021
SW8	Dry/insufficient volume	June, August and November 2021

3) a) Some or all surface water sampling and monitoring program requirements for the monitoring period have been established outside of a ministry ECA or authorizing/control document.	( ) **Yes** (●) **No** ( ) **Not Applicable**	
b) If yes, all surface water sampling and monitoring identified under 3 (a) was successfully completed in accordance with the established program from the site, including sampling protocols, frequencies, locations and parameters) as developed per the Technical Guidance Document:	( ) **Yes** ( ) **No** (●) **Not Applicable**	If no, specify below or provide details in an attachment.

Surface Water Sampling Location	Description/Explanation for change (change in name or location, additions, deletions)	Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date
Type Here	Type Here	Select Date

4) All field work for surface water investigations was done in accordance with SOP, including internal/external QA/QC requirements, as established/outlined as per the Technical Guidance Document, MOE 2010, or as amended. (Note: A SOP can be from a published source, developed internally by the site owner's consultant, or adopted by the consultant from another organization):	◉ **Yes** ○ **No**	If no, specify (Type Here):

Sampling and Monitoring Program Results/WDS Conditions and Assessment:

5) The receiving water body meets surface water-related compliance criteria and assessment criteria: i.e., there are no exceedances of criteria, based on MOE legislation, regulations, Water Management Policies, Guidelines and Provincial Water Quality Objectives and other assessment criteria (e.g., CWQGs, APVs), as noted in Table A or Table B in the Technical Guidance Document (Section 4.6):	○ **Yes** ◉ **No**

If no, list parameters that exceed criteria outlined above and the amount/percentage of the exceedance as per the table on the following page or provide details in an attachment:

Parameter	Compliance or Assessment Criteria or Background	Amount by which Compliance or Assessment Criteria or Background Exceeded
e.g. Nickel	e.g. ECA limit, PWQO, background	e.g. X% above PWQO
See Sections 5.5, 6.2 and Tables 5.8 and 5.10 of the 2021 Operations & Monitoring Report	Type Here	Type Here
Type Here	Type Here	Type Here
Type Here	Type Here	Type Here
Type Here	Type Here	Type Here
6) In my opinion, any exceedances listed in Question 5 are the result of non-WDS related influences (such as background, road salting, sampling site conditions)?	(●) **Yes** ( ) **No**	Elevated PAHs at SW6 may be related to historic slag stockpiles in the vicinity of the Site and the use of road ballast along the Site entrance. The exact source of the detected parameters is not known.

7) All monitoring program surface water parameter concentrations fall within a stable or decreasing trend. The site is not characterized by historical ranges of concentrations above assessment and compliance criteria.	○ **Yes** ◉ **No**	See Section 5.5. Background and downstream surface water quality fluctuates and shows concentrations above assessment criteria.
8) For the monitoring program parameters, does the water quality in the groundwater zones adjacent to surface water receivers exceed assessment or compliance criteria (e.g. , PWQOs, CWQGs, or toxicity values for aquatic biota (APVs)):	○ Yes ○ No ○ Not Known ◉ Not Applicable	
9) Have trigger values for contingency plans or site remedial actions been exceeded (where they exist):	◉ **Yes** ○ **No** ○ **Not Applicable**	Laboratory analysed pH (8.87) did not meet the trigger level on June 1, 2021, and the field measured pH (6.32) did not meet the trigger level on November 12, 2021 for the Stormwater management system pond as outlined in Section 6.2 of the 2021 Operations & Monitoring Report.

Surface Water CEP Declaration:

I, the undersigned hereby declare that I am a Competent Environmental Practitioner as defined in Appendix D under Instructions, holding the necessary level of experience and education to design surface water monitoring and sampling programs, conduct appropriate surface water investigations and interpret the related data as it pertains to the site for this monitoring period.

I have examined the applicable Environmental Compliance Approval and any other environmental authorizing or control documents that apply to the site. I have read and followed the Monitoring and Reporting for Waste Disposal Sites Groundwater and Surface Water Technical Guidance Document (MOE, 2010, or as amended) and associated monitoring and sampling guidance documents, as amended from time to time. I have reviewed all of the data collected for the above-referenced site for the monitoring period(s) identified in this checklist. Except as otherwise agreed with the ministry for certain parameters, all of the analytical work has been undertaken by a laboratory which is accredited for the parameters analysed to *ISO/IEC 17025:2005 (E)- General requirements for the competence of testing and calibration laboratories,* or as amended from time to time by the ministry.

If any exceptions or potential concerns have been noted in the questions in the checklist attached to this declaration, it is my opinion that these exceptions and concerns are minor in nature or will be rectified for future monitoring events. Where this is not the case, the circumstances concerning the exception or potential concern and my client's proposed action have been documented in writing to the Ministry of the Environment District Manager in a letter from me dated:

Select Date

Recommendations:

Based on my technical review of the monitoring results for the waste disposal site:

◉ **No Changes to the monitoring program are recommended** ○ **The following change(s) to the monitoring program is/are recommended:**	
◉ **No changes to the site design and operation are recommended** ○ **The following change(s) to the site design and operation is/ are recommended:**

Table index

Figure index

Appendices

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown in Figure 1.1.

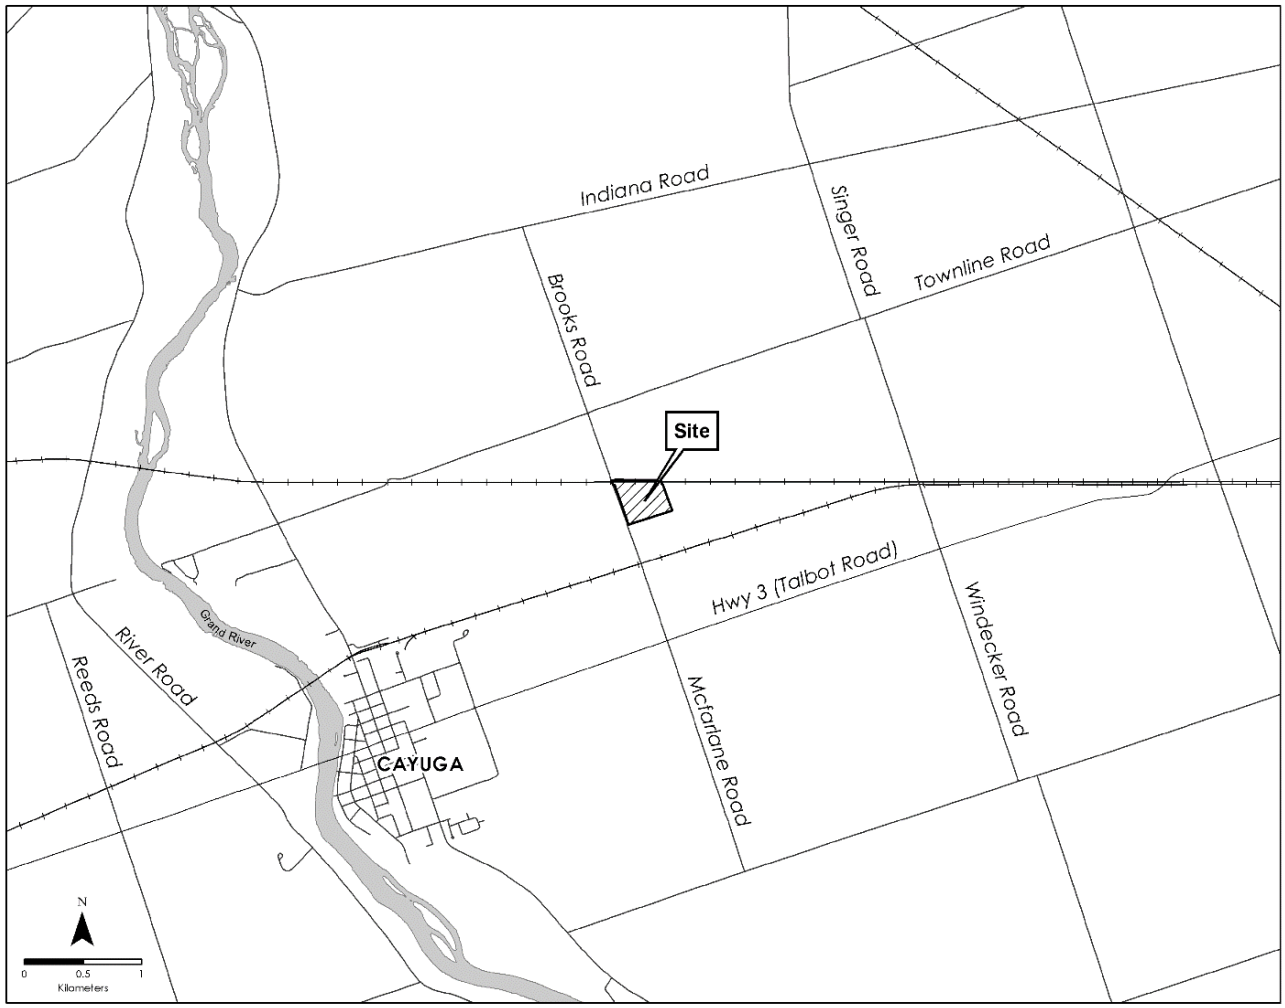

Figure 1.1 Location of the Proposed Undertaking

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (Landfill ECA), has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA) and industrial sewage works ECA No. 1122-BKUPSM (Industrial Sewage ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the Site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road

Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customers for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by approximately 219,400 m^3, adding capacity equal to approximately two additional years. This expansion would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown in **Figure 1.2.**

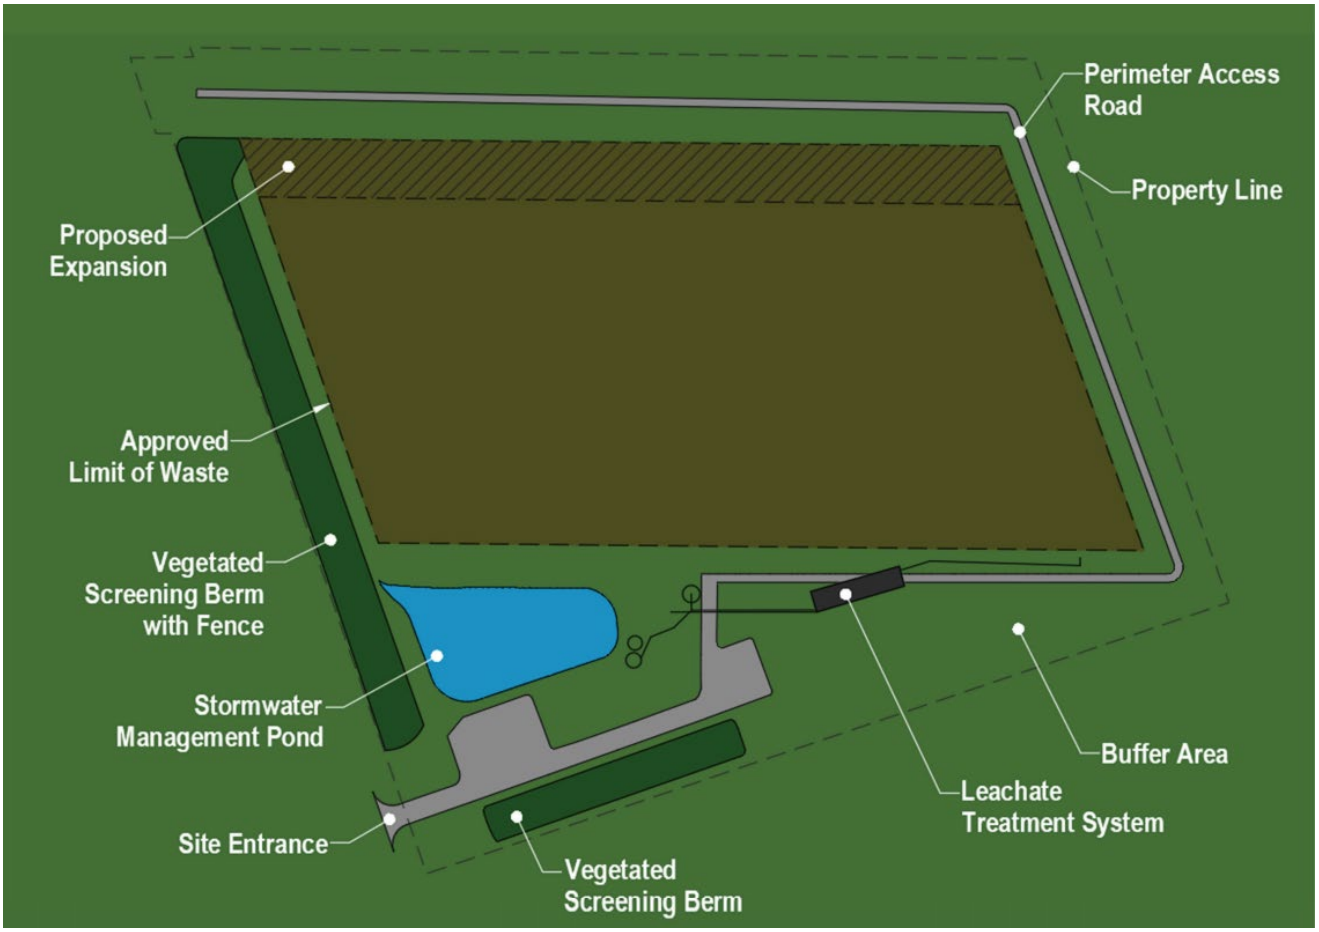

Figure 1.2 Proposed Capacity Expansion Concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by approximately 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:

1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302.

GHD has prepared a Geology and Hydrogeology Assessment on behalf of BRE to support the proposed undertaking. This report documents the following as it relates to the geologic and hydrogeologic environment:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project)
– Potential effects on the environment, mitigation measures, and net effects
– Future monitoring requirements to be implemented

The Study Areas reviewed for the geology and hydrogeology assessment were as follows (see **Figure 1.3**):

– **On-Site** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– **Site-Vicinity** – the area within the vicinity of the Site extending approximately 1 km in all directions

2. Screening Criteria Checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act*

As noted in the Guide:

*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required.*

Where a "Yes" has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion".

Each criterion is based on a question which is prefaced with the phrase, "*Might the Project*…" Table 2.1 was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Geology and Hydrogeology discipline. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in Section 4 of this report.

Table 2.1 Screening Criteria Checklist – Geology and Hydrogeology

	Criterion	YES	NO	Additional Information
	Might the project…			
1. Surface and Groundwater				
1.2	Cause negative effects on groundwater quality, quantity, or movement?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on groundwater quality, quantity, or movement.
1.4	Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment.

3. Existing Conditions

The following subsections describe the existing conditions that are found within the On-Site and Site-Vicinity Study Areas of the proposed project.

3.1 Methodology

3.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Geology and Hydrogeology Study Team to determine existing geology and hydrogeology conditions within the Study Areas. The following sources of secondary information were collected and reviewed:

Site-Specific Reports

- GHD Limited. (April 2022). 2021 Annual Operations and Monitoring Report, Brooks Road Landfill Site, Haldimand County, Ontario.
- Conestoga-Rovers and Associates. (October 2002, Amended November 2003). Design and Operations Report, Edwards Landfill Site, Haldimand County, Ontario.
- Conestoga-Rovers and Associates. (October 2002). Hydrogeologic Performance Assessment - Updated Design, Edwards Landfill Site, Haldimand County, Ontario.
- Conestoga-Rovers and Associates. (July 2010). Updated Site Decommissioning Plan, Edwards Landfill Site, Haldimand County, Ontario.
- Conestoga-Rovers and Associates. (July 2004). Well Survey and Limited Hydrogeological Assessment, Edwards Landfill Site, Haldimand County, Ontario.
- Conestoga-Rovers and Associates. (January 2014). Site Decommissioning Report, Brooks Road Landfill Site, Haldimand County, Ontario.
- GHD Ltd. (May 2016). Gypsum Mine Investigation Report, Haldimand County, Ontario.

Government Information Available in the Public Domain

– Active and abandoned gas wells in proximity to the Site were also reviewed (source: Oil, Gas & Salt Resources Library, London, ON.

3.2 Description of Existing Conditions

The Site is situated on the Haldimand Clay Plain[1] approximately 2 km northeast of the Town of Cayuga. The Site is relatively flat. The regional topography is generally flat with a gentle slope to the south towards Lake Erie. The elevation of the Site is approximately 200 m AMSL[2]. A Site location map, which includes regional elevations, is included as Figure 3.1.

A review of soil surveys indicates that the surficial soils in the vicinity of the Site are classified as mainly lacustrine silty clay[3]. A review of the quaternary geology in the Site-Vicinity indicates that the area is generally underlain by glaciolacustrine clay and silt[4]. Published bedrock topography mapping indicates a bedrock elevation of approximately 182.5 m AMSL in the vicinity of the Site[5]. The bedrock geology in the vicinity and underlying the Site is comprised of argillaceous dolostone, shale, and evaporites of the Salina Formation[6].

Site Geology

The overburden geology is relatively uniform beneath the Site. In general, the Site is characterized by a thick (14 to 18 m) glaciolacustrine layer of stratified silty clay, silty clay till and varved clays, underlain by a thin (1 to 3 m) discontinuous layer of silty sand till with varying proportions of gravel and clay. The bedrock has been encountered at depths varying from 15.2 to 20.2 m below ground surface (BGS). A thin surficial deposit of topsoil is generally observed at the surface of the Site, with the exception of the southwestern portion.

The silty clay deposits are described as being locally fractured (weathered) from the surface down to depths varying from 3 to 5 m BGS and are characterized as a very stiff to hard with low plasticity. At depths more than 5 m, the silty clay deposits have little to no fracturing and the consistency of the units increase from stiff to very stiff.

Underlying the silty clay deposits, a thin discontinuous silty sand till with varying proportions of clay and gravel is encountered across the Site. The silty sand till ranges in thickness from 1 to 3 m and often contains cobbles and/or broken angular bedrock fragments. This deposit is usually well graded with fine to medium grained sand, minor silt and trace clay, and is described as dense to compact, grey, and saturated. The silty sand till rests directly over the bedrock.

Bedrock underlying the Site has been described as a fractured shale, dolostone and gypsum of the Salina Formation. The top of bedrock elevation ranges from 180.8 to 187.0 m AMSL and forms a small bedrock valley from northwest to southeast across the Site. The valley is characterized by a thicker silty sand till deposit. Regionally, the bedrock topography dips to the south.

Site Hydrogeology

In general, the geologic units identified at the Site may be grouped into two main hydrogeologic units separated by the thick silty clay aquitard unit, as follows:

i) An unconfined water table (shallow overburden) unit within shallow fractured silty clay (weathered) unit

ii) Silty clay aquitard

iii) A confined basal till overburden/shallow bedrock aquifer

These two hydrogeological units are separated by a thick (between 9 and 12 m) layer of stratified silty clay, silty clay till, and varved clays which form a continuous aquitard of very low hydraulic conductivity. Groundwater level data historically gathered from the shallow overburden unit and basal overburden/shallow bedrock aquifer indicate that the clay aquitard provides hydraulic separation between the two units. Differences in hydraulic head between the two units have varied between 9.5 to 15 m as historically measured at the location of nested wells. The vertical hydraulic gradient between the two hydrogeologic units is downward.

Based on historical groundwater level data, the shallow overburden unit is generally encountered at depths varying from 0.5 to 4 m BGS across the Site. The shallow overburden unit is an unconfined water table unit, which overlies the impermeable un-weathered silty clay unit. Based on the shallow overburden monitoring wells monitored in 2021, groundwater flow in this unit is generally towards the south towards Lake Erie.

Underlying the silty clay aquitard, a confined basal overburden/shallow bedrock aquifer has been observed within the lower portion of the silty sand till unit and the shallow fractured bedrock. Groundwater quality and water level data indicate that the lower silty sand till unit and the shallow fractured portion of the bedrock are hydraulically connected and geochemically similar. Therefore, these two geological units have been considered to form one aquifer.

Based on the groundwater data obtained to date, the basal overburden/shallow bedrock aquifer is generally encountered at depths varying from 14 to 17 m BGS. The groundwater flow pattern in this aquifer is in a south to southwest direction with a relatively flat horizontal hydraulic gradient.

Natural Gas Deposits and Natural Gas Wells

A review of oil, gas and salt resource mapping in Ontario indicates that several active and plugged gas wells are located within the Site-Vicinity. No active/plugged gas wells were identified on the Site, however research indicates

that 23 current and former gas wells are located within the Site-Vicinity. A total of 16 gas wells have been identified as abandoned, of which 15 have been identified as plugged, and a total of seven gas wells that may be active, suspended, or abandoned are found within the Site-Vicinity. The gas wells all targeted the Haldimand Pool within the Clinton Group and were drilled to a total depth (true vertical depth) ranging from 207.6 to 229.5 m BGS at approximately the top of the Queenston Formation. A natural gas pipeline is also located approximately 400 m south of the Site. A list of the Ontario Oil and Gas Wells located within the Site-Vicinity is itemized in Table 3.1 and a reference Figure is attached as Figure 3.2.

Due to the depths of the natural gas wells, it is not anticipated that there would be any influence from the landfill on the natural gas wells.

Mining Claims and Abandoned Mines

A review of the Ministry of Northern Development and Mines (MNDM) information for abandoned mines and mining claims was completed. No mining claims were identified within the On-Site area, however one abandoned mine was identified within the Site-Vicinity to the northwest of the Site (AMIS File # 04888 / MDI # MDI30L13NW00003). The mine was reviewed in a CRA report entitled Well Survey and Limited Hydrogeological Assessment, dated July 2004 (2004 Report). The 2004 Report indicates two documents were reviewed: Gypsum in Ontario, C.R.Guillet, dated 1964, and Abandoned Mines Hazard Abatement Program, London District Site Examinations, prepared by Patrick Chance & Associates Consulting Geologists, dated 1994 (1994 Inspection). The information presented below was gathered from the above-referenced reports and has been revised with the most current information available including information from the Gypsum Mine Investigation Report prepared by GHD that provides an assessment of potential influences of the former Cayuga Gypsum Mine on groundwater at the landfill Site.

The former gypsum mine was operated by the Cayuga Gypsum Company Limited between 1942 and 1949. Gypsum was mined from a 0.9 m thick bed at a depth of 25.9 m BGS.

Mining operations were accomplished via two mine shafts. The first shaft was located approximately 112 m south of Townline Road and 350 m west of Brooks Road. The former shaft can reportedly be located by a 2.4 m deep depression, with a footprint of 3 by 4.6 m. The shaft was a vertical prospect shaft of unknown support and was back-filled with unknown materials. The 1994 Inspection did not document any evidence of subsidence, however the report recommended that a 50 m radius area of caution be observed in the vicinity of this shaft.

Based on the available historical documentation, approximately 10,300 tonnes of gypsum were reportedly removed from this prospect shaft during the operation of the mine. With a density of 2.3 t/m^3 and a thickness of 1 m, this would correspond to lateral workings with an aerial footprint of approximately 4,356 square metres (m^2). In order to access the gypsum in the 1 m seam, it is likely that approximately 1-2 m of the overlying shale bedrock would also have been removed.

The second shaft was located approximately 305 m south of the first shaft. The 1994 inspection was reportedly unable to locate the second shaft. The second shaft was also a vertical prospect shaft of unknown support, and it is unknown if the shaft has been back-filled. It is not known how much gypsum was removed from this shaft.

Due to property access restrictions, an inspection of the former Cayuga Gypsum Mine could not be conducted.

During the operation of the mine from 1942 to 1949, dewatering operations would likely have been conducted to keep the mine shafts and associated galleries dry. As such, during the operation of the mine, the local groundwater flow would have been influenced by mine dewatering activities. Active removal of large quantities of groundwater from the bedrock would have resulted in inward hydraulic gradients. As such, the bedrock groundwater flow in the vicinity of the former mine would have been directed toward the active galleries during the operation of the mine.

Upon closure of the mine in 1949, the dewatering activities at the mine would have ceased and the associated mine shafts and galleries would have flooded within the first year of closure. The mine has now been abandoned for 67 years. Since the former galleries and shafts are flooded, no water deficit should be present between these former underground structures and the surrounding bedrock. Thus, essentially steady state conditions should exist, and the former underground structures will no longer have a hydraulic influence on the local bedrock aquifer.

In the unlikely event that the former mine shafts would not have been properly sealed following the closure of the mine, there could exist the potential for surface water and groundwater in the shallow overburden to enter the mine shafts and migrate to the underlying bedrock aquifer. If infiltration were occurring, the shafts would be acting as a sink to the overburden groundwater and a source of recharge to the local bedrock groundwater. This would result in a cone of depression in the overburden groundwater towards the former mine shafts and radial flow from the galleries in the bedrock groundwater. Under this scenario there could be a potential for bedrock groundwater flow being diverted away from the former galleries. However, based on the relatively small dimension of the former galleries (areal extent of approximately 4,356 m^2) it is expected that any influence of these galleries on the bedrock aquifer would be localized to the immediate vicinity of the former galleries. Bedrock aquifer influence beyond the limits of the former Cayuga Gypsum Mine property is anticipated to be negligible.

The Gypsum Mine Investigation Report reviewed information related to historical mining operations including location and extent of mining activities, review of physical site conditions for evidence of historical mining operations, and an evaluation of hydraulic gradients within the available monitoring network to identify potential evidence of a hydraulic influence on horizontal or vertical gradients in the vicinity of the Site. The report concluded that there is no evidence of an influence related to the former Cayuga Gypsum Mine on the bedrock aquifer at the Landfill Site.

Other Data Sources

A review of the Ontario Geological Survey Karst of Southern Ontario and Manitoulin Island report indicates that not potentially karst, inferred karst, or known karst bedrock has been identified within the study area[7]. Furthermore, the groundwater conditions are unfavourable for the dissolution of the bedrock and the Upper Silurian bedrock consists of generally argillaceous dolostone, shale, and evaporites (primarily gypsum), the latter of which precludes the formation of large-scale karst features. Furthermore, no sink holes or caving features have been identified in the study area.

4. Potential Effects, Mitigation Measures & Net Effects

A Project Description, which includes proposed engineering design figures, was prepared so that potential environmental effects and mitigation measures could be identified. The following subsections provide a general summary of the proposed undertaking.

4.1 Description of Project Components and Activities

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final Site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in Table 4.1, below.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91

[7] Brunton, F.R. and Dodge, J.E.P. 2008: Karst of Southern Ontario and Manitoulin Island; Ontario Geological Survey, Groundwater Resources Study 5. ISBN 978-1-4249-8376-6 (ZIP FILE).

Design Component	Existing Landfill	Proposed Capacity Expansion
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted by 30 m. East and west ditches will extend to maintain full perimeter ditch.
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Methodology and Investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that are based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in Section 2 of this report.

The assessment of effects was carried out by modelling the predicted effects of the landfill on the hydrogeologic regime under the scenario of the proposed expansion. The modelling took into consideration the existing conditions at the Site, the known hydrogeologic characteristics, as documented extensively in previous reports (including the most recent annual monitoring reports), and the proposed modifications to the Site design. Modelling was undertaken to estimate the quantitative and qualitative effects on the local hydrogeologic regime resulting from the lateral expansion of the waste footprint and landfilling of additional waste. The modelling takes into consideration the proposed design, including final cover, the liner system and the leachate collection system. The modelling considered scenarios that included worst-case mass loading to the underlying hydrogeologic regime (i.e., used maximum measured concentrations in leachate between 2017-2021 and considers the period when landfilling is near final capacity and maximum leachate generation volumes were reached).

Modelling included two scenarios. The first scenario involved 6 m of leachate mounding over the composite liner for 50 years, followed by complete failure of the HDPE liner. In this scenario, the leachate collection system and the HDPE liner were modelled with a service life of 50 years in order to maintain consistency with the previously modelled failure scenario. Following the 50-year service period, the HDPE liner was removed from the liner system and the

leachate head was maintained at 6 m above the base of the collection system. The second scenario modelled the effect of 6 m of head on the liner system with the HDPE liner entirely absent for the duration of the model.

Appendix A includes a report entitled Hydrogeologic Assessment – Landfill Expansion, Brooks Road Landfill (GHD, 2022) (Hydrogeologic Assessment Report). This report provides a full description of the hydrogeologic assessment of the proposed landfill expansion design, including descriptions of the methodology, existing conditions and predicted results of the expansion modelling. The results of the modelling demonstrate that the Site design features are sufficiently protective of the local hydrogeologic regime. The results of modelling indicate that concentrations of contaminants of concern entering the basal till aquifer will be reduced by an average factor of 4 prior to off-Site migration.

Groundwater quality is forecasted to be acceptable at the downgradient boundary with respect to the Ontario Drinking Water Standards (ODWS) and Site-specific Reasonable Use Concept (RUC) criteria.

4.3 Geology and Hydrogeology Net Effects

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those geology and hydrogeology criteria which might be affected by the project as identified in Section 2. The effects assessment describes how existing environmental conditions in the Study Areas would change as a result of the construction and operation of the proposed undertaking.

As described in Section 2, a "Yes" was applied to the following geology and hydrogeology criteria:

	Criterion	YES	NO	Additional Information
	Might the project…			
1.2	Cause negative effects on groundwater quality, quantity, or movement?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on groundwater quality, quantity, or movement.
1.4	Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment.

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.3.1 Potential Effects on Geology and Hydrogeology

The potential effects on the geology and hydrogeology environment are related primarily to the release of waste-related contaminants into the subsurface hydrogeologic regime. This release would occur as a result of leachate generated within the waste mound exiting the landfilled waste mass through the bottom or sides of the landfill and migrating into the shallow water table aquifer or the basal till/bedrock aquifer. Leachate-related impacts could travel downward from within the waste mass until reaching the basal till/bedrock aquifer. Once entering this aquifer, the impacts would travel laterally as advective flow in the direction of the natural horizontal hydraulic gradient (to the south).

4.3.2 Mitigation Measures

The mitigation measures implemented into the design to reduce or eliminate the potential effects on the geology and hydrogeology environment include:

1. The final cover system
2. The leachate collection system
3. The liner system

In addition to these engineered controls, the Site is also situated within a fine-grained (clay-rich) stratigraphic sequence with significant vertical thickness. This natural feature provides additional protection of the underlying aquifer as well as some beneficial attenuation capacity.

Section 6 of the Hydrogeologic Assessment Report provides a fulsome description of the modelling inputs, which includes the relevant design elements of engineered controls and the natural geologic setting. These elements in combination represent the measures which mitigate the potential effects of the proposed landfill expansion.

4.3.3 Net Effects

The net effects of the proposed landfill expansion on the geology and hydrogeology environment are the effects to this environment after the mitigation measures are applied. Accordingly, the results of the predictive modelling undertaken to estimate the magnitude of groundwater alteration resulting from the Project represent the net effects.

Section 6.5.3 of the Hydrogeologic Assessment Report describes the results of the predictive modelling. The primary receptor of concern with respect to the net effects is groundwater quality within the basal till/bedrock aquifer at the downgradient Site boundary. As described in Section 6.5.3 of the Hydrogeologic Assessment Report, water quality at the downgradient Site boundary within the basal till/bedrock aquifer is predicted to meet ODWS and Site-specific RUC criteria even at peak concentrations under the scenario of leachate collection system failure. On the basis of this predictive modelling, the proposed expansion is expected to result in only negligible or insignificant alterations to the geology and hydrogeology environment.

5. Monitoring Requirements and Additional Approvals

To ensure that the mitigation measures identified in Section 4 are functioning as envisioned, a strategy and schedule was developed for monitoring environmental effects. With these mitigation measures and monitoring requirements in mind, commitments have also been proposed for ensuring that they are carried out as part of the construction, operation, and maintenance of the proposed undertaking.

5.1 Monitoring Requirements

A comprehensive leachate and groundwater monitoring program (water levels and quality) is proposed. This proposed program includes a trigger level and contingency implementation plan in order to supplement the routine program and ensure appropriate responses are implemented in the event that water quality results indicate that an undesirable effect on groundwater quality is imminent.

The proposed routine monitoring program and trigger level and contingency implementation plan are outlined in detail in Section 7 of the Hydrogeologic Assessment Report.

5.2 Additional Approvals

No additional approvals are required in relation to the geology or hydrogeology environment.

6. Conclusion

On the basis of the net effects analysis performed, the proposed expansion is not anticipated to have an unacceptable impact on the geology and hydrogeology environment.

1. Introduction

1.1 Purpose of this Report

GHD Ltd. (GHD) has prepared the following Hydrogeologic Performance Assessment Report on behalf of Brooks Road Environmental (BRE) c/o 2270386 Ontario Limited to support a landfill expansion project at the Brooks Road Landfill located at 160 Brooks Road, Cayuga, Ontario (herein referred to as the Site).

The objective of this Hydrogeologic Performance Assessment Report is to evaluate the anticipated environmental performance of the Site in terms of groundwater quality at the downgradient Site boundary following expansion of landfill area to the north of the existing approved waste footprint. This report is intended to satisfy the requirements of Ontario Regulation 232/98 and has been prepared in support of the Environmental Assessment and application to amend the Site's existing landfill Environmental Compliance Approval (ECA) No A110302.

The existing landfill was developed based on the Hydrogeologic Performance Assessment – Updated Design, Edwards Landfill Site prepared by GHD in 2002 and the Vertical Expansion Environmental Assessment approved in 2018. Given the proposed expansion will utilize an expanded waste footprint, an updated hydrogeologic assessment is required to satisfy the conditions in Section 8 of Ontario Regulation 232/98.

This Hydrogeologic Performance Assessment Report has been prepared to ensure that the geologic and hydrogeologic conditions are suitable for the proposed expansion. This report has been prepared utilizing the extensive hydrogeologic investigations previously conducted at the Site with a focus on ensuring that the proposed expansion design will not result in any adverse impact to off-Site groundwater and to verify existing groundwater monitoring and leachate contingency plans as amended to accommodate the expanded waste footprint continue to be effective in providing a good understanding of the geologic and hydrogeologic performance of the Site.

1.2 Background

1.2.1 Site Location

The Site is an approved waste disposal site with an approved fill rate of 1,000 tonnes per day (250,000 tonnes per year) and current approved capacity of 1,045,065 cubic metre (m^3) (including waste and daily cover).

The Site is located at 160 Brooks Road in Haldimand, Ontario, approximately 1 kilometre (km) north of Kings Highway No. 3 (Talbot Road). The Site is legally described as Part of Lot 24, Concession I-N.T.R., Haldimand County.

The total Site area is approximately 14.3 hectares (ha) (35.3 acres) of which 6 ha (15 acres) is currently approved for landfilling.

The regional Site location is presented on **Figure 1.1**. The local Site location is presented on **Figure 1.2**. Copies of the legal surveys for the Site are provided in **Appendix A**.

1.2.2 Regulatory Approvals

The following lists the Site's operating ECAs:

– Landfill - ECA No. A110302 was issued on October 7, 1980 and was most recently amended on October 1, 2021.
– Industrial Sewage Works – ECA No. 1122-BKUPSM was issued on February 3, 2020
– Air - ECA No. 7323-C6EJUM was issued on September 24, 2021

Copies of the ECAs, and associated amendments, are included in **Appendix B**.

The following provides a description of the most recent ECAs issued for the Site.

An Environmental Assessment (EA) for a 400,000 m^3 vertical expansion was submitted on February 10, 2017. The EA was subject to a seven-week public and agency comment period, followed by a Ministry review and a public inspection of the Ministry Review, which concluded in August 2017. The Notice of Approval to Proceed with the Undertaking - EA Reference Number 13004 and EA File Number 03-08-02 (Notice of Approval) was signed by the Minister of the Environment, Conservation and Parks on January 15, 2019, was approved by cabinet on February 14, 2019, and received by BRE on March 13, 2019.

In April 2019, an ECA amendment application was submitted to the Ministry of the Environment, Conservation, and Parks (MECP) for Landfill ECA No. A110302 to implement the vertical expansion. On March 27, 2020, the Landfill ECA was amended. The environmental monitoring program for landfill gas (LFG), groundwater, surface water, and leachate were also updated in the amended Landfill ECA.

In September 2019, an ECA amendment application was submitted to the MECP to amend the Industrial Sewage Works ECA to increase the on-Site treatment rate, increase the treated effluent discharge rate and to operate the treatment system on a continual discharge basis. On February 3, 2020, the Industrial Sewage Works ECA was amended, resulting in Industrial Sewage ECA No. 1122-BKUPSM.

In June 2021, an ECA amendment application was submitted to the MECP to amend the Landfill ECA to increase the annual waste fill rate to 250,000 tonnes per year. On October 1, 2021, the Landfill ECA was amended. The Air ECA was also amended based on this submission.

1.2.3 Site History

Based on the information provided in the original 1971 application, the Site was approved under a Provisional Certificate of Approval (now called ECA) as a 15-acre (6.07 ha) landfill site with a daily fill rate of 10 tons (9.07 tonnes). The approved waste composition was 95 percent domestic (solid); 2 percent industrial (solid); 2.75 percent agricultural (solid); and 0.25 percent sewage sludge from the Caledonia Sewage Treatment Plant. The service area for the Site included the Province of Ontario.

Waste from various municipalities in the vicinity of the Site continued to be disposed at the Site on an ongoing basis from 1959 until 1977. After 1977, waste disposal activities were carried out on an intermittent basis. During the above period, waste disposed at the Site was placed in unlined trenches excavated into the native silty clay soils within the Site. After filling the trenches, waste was disposed directly on the ground surface and covered with a layer of the native soil. The waste stream included metal drums containing resin which had also been disposed at the Site.

Redevelopment of the landfill commenced with the construction of the Stage 1 engineered landfill cell and decommissioning and clean-up of the original landfill. Decommissioning of the original landfill commenced on September 4, 2012, and was completed on August 21, 2013 and satisfied Condition 30 of the Landfill ECA No. A110302 Notice 2. A total of 60,204 m^3 of non-hazardous solid waste and impacted soil was exhumed and transported to the newly constructed Stage 1 landfill cell for disposal. A total of 146.2 metric tons of non-hazardous solid waste, and 47.17 metric tons of suspect hazardous solid waste was exhumed and transported off Site for disposal. A total of five over-packed drums of solid non-hazardous waste were transported off Site for disposal. A total of 27,680 litres of a mixture of groundwater and leachate was pumped from the original landfill trenches and transported off Site for disposal.

The redevelopment of the Site included the construction of new lined landfill cells as follows:

– Stage 1 was completed in 2007
– Stage 2A was completed in 2013
– Stage 2B/3A was completed in 2013
– Stage 3B was completed in 2015

The vertical expansion will include Stages 5 through 8 and are being constructed on top of the Stage 1 through Stage 3B.

A stormwater management system and on-Site leachate treatment system (LTS) have been established on Site. Clean storm water and treated effluent are discharged to the Brooks Road roadside ditch and are regulated by ECA No. 1122-BKUPSM.

1.2.4 Previous Studies

Previous studies completed at the Site utilized in the preparation of this Hydrogeologic Performance Assessment Report include:

1. 2021 Operations and Monitoring Report, March 2022, prepared by GHD Ltd. for 2270386 Ontario Limited
    a. GHD has complete routine monitoring and reporting between 2004-2017 and from 2017 onwards
2. 2020 Operations and Monitoring Report, March 2021, prepared by GHD Ltd. for 2270386 Ontario Limited
3. Leachate Trigger Level Plan, Brooks Road Landfill Site, Haldimand County, November 2019, prepared by GHD Ltd. for 2270386 Ontario Limited
4. 2019 Stormwater Contingency and Remedial Action Plan, Brooks Road Landfill Site, Haldimand County, prepared by GHD Ltd. for 2270386 Ontario Limited
5. Design and Operations Report – Vertical Expansion – Brooks Road Landfill Site, April 2019, prepared by GHD Ltd. for 2270386 Ontario Limited
6. Gypsum Mine Investigation Report, Brooks Road Landfill Site, 160 Brooks Road, Haldimand County, Ontario, June 2016, prepared by GHD Ltd. for 2270386 Ontario Limited
7. Design and Operations Report - Edwards Landfill Site, October 2002, prepared by Conestoga-Rovers & Associates Limited for Haldimand-Norfolk Sanitary Landfill Inc.
8. Hydrogeologic Performance Assessment – Updated Design, Edwards Landfill Site, Haldimand County, Ontario, October 2002, prepared by Conestoga-Rovers & Associates Limited for Haldimand-Norfolk Sanitary Landfill Inc.

The following publicly available information has been considered in the preparation of this report:

1. Karst geology report/mapping: Brunton, F.R. and Dodge, J.E.P. 2008: Karst of Southern Ontario and Manitoulin Island; Ontario Geological Survey, Groundwater Resources Study 5. ISBN 978-1-4249-8376-6 (ZIP FILE).
2. Physiography mapping: Chapman, L.S. and Putnam, D.F, 1984: The Physiography of Southern Ontario; Ontario Geological Survey, Special Volume 2, Ontario Ministry of Natural Resources., Third addition.
3. Topography Mapping: National Topographic System, 1983: Dunnville, Ontario; Canada Centre for Mapping, Department of Energy, Mines & Resources, Information Current as of 1980, Map Sheet 30 L/13, Edition 6, scale 1:50,000.
4. Soils mapping: Ontario Institute of Pedology, 1983: Soils of Haldimand-Norfolk Regional Municipality; Cartography Section, Land Resource Research Institute, Research Branch, Agriculture Canada, Soil Survey Report No. 57, Sheet 6, scale 1:25,000.
5. Bedrock topography mapping: Feenstra, B.H., 1981: Bedrock Topography of the Dunnvile Area, Southern Ontario; Ontario Geological Survey, Preliminary Map P.2412, scale 1:50,000.
6. Bedrock geology mapping: Telford, P.G., and Tarrant, G.A., 1975: Paleozoic Geology of the Dunnvile Area, Southern Ontario; Ontario Division of Mines, Preliminary Map P.988, Geological Series, scale 1:50,000. Geology 1974.
7. Quaternary geology mapping: Feenstra, B.H., 1974: Quaternary Geology of the Dunnvile Area, Southern Ontario; Ontario Division of Mines, Preliminary Map P.981, Geological Series, scale 1:50,000. Geology 1973.

1.3 Report Organization

This Hydrogeologic Performance Assessment Report is organized into the following sections:

Section 1 Introduction

Section 2 Regional Physical Setting

Section 3 Site Physical Setting

Section 4 Natural gas, Mines, and Karst Consideration

Section 5 Residual Site Impact Assessment

Section 6 Hydrogeologic Assessment of the Proposed Landfill Expansion Design

Section 7 Proposed Monitoring and Reporting Programs

Section 8 Contingency Plans

Section 9 Summary and Conclusion

2. Regional Physical Setting

2.1 Description of Area

The Site is located in Part of Lot 24, Concession I-N.T.R., of the former North Cayuga Township, former Regional Municipality of Haldimand-Norfolk, and now Haldimand County.

The Site is located north-east of Cayuga on Brooks Road, approximately 1,000 metres (m) north of Kings Highway No. 3 (Talbot Road). The total Site area is approximately 14.3 hectares (ha) with a currently approved landfill area of 6 ha. The Site is located within a rural area with limited development of surrounding lands. The regional Site location is illustrated on **Figure 1.1**. The local Site location map is illustrated on **Figure 1.2**.

The Site is bounded to the north by a rural property consisting of undeveloped fields (i.e. long-term inactive agricultural crop production lands) and forested area. The Site was formerly bounded to the north by the Canada Southern Railway right-of-way locally referred to as the Michigan Central Railway and/or Conrail (Conrail) right-of-way; however, this portion of the railways was incorporated into the Site as part of the 2004 site expansion/development. It is understood that the southerly portion of the undeveloped fields north of the right-of-way was previously used for rail transfer of aggregate.

To the south, the Site is bounded by an rural property which forms part of a larger continuous agricultural land parcel which includes lands abutting the east portion of the Site and extending north to the aforementioned rail right-of-way. Agricultural lands extend further south from the Site to Highway 3 and are bisected by an abandoned Canadian National Railway (CNR) right-of-way. These lands are used primarily for passive livestock pasture purposes and consist of a combination of old fields and forested areas.

The Site is bounded to the west by Brooks Road. Brooks Road was previously used as a heavy load access route for rail transport of aggregate and by a former 1940s gypsum mine located in the area. On the west side of Brooks Road is an undeveloped rural property characterized primarily by dormant fields with occasional bush lots.

There are no buildings located on any of the adjacent properties to the Site. No municipal services (i.e., water, sanitary and storm sewers) are provided to the Site nor have any municipal services been extended to any of the adjacent properties.

2.2 Regional Setting

The following subsections provide a summary of the regional physical setting within which the Site is situated.

2.2.1 Physiography

The Site is located within the Haldimand Clay Plain which lies between the Niagara Escarpment and Lake Erie in this Region as mapped in “The Physiography of Southern Ontario”, (Chapman and Putman, 1985). This physiographic setting is characterized by stratified clay deposited mainly during the deep-water stages of glacial lakes Whittlesey and Warren and clay till deposits from advances and retreats of the Ontario-Erie glacial lobe towards the end of the Wisconsinan age.

2.2.2 Regional Topography and Drainage

As shown on **Figure 1.2**, the Site sits in the south-west corner of a localized topographic high at 200 m above mean sea level (AMSL). This boundary skirts a poorly drained area which runs to the north and appears to be the source of a number of shallow streams. To the north and west, surface drainage is to the Grand River down the terraces of an ancient spillway; many of these small streams are tributaries of Pike Creek which flows through Cayuga before emptying into the Grand River. To the south, drainage is by a roadside ditch that drains to a creek which traverses the farm property immediately south of the Site. This creek is known as Norton Creek which flows 7 km to the Grand River south of Cayuga.

The boundary of the Grand River Watershed is found along the north and northeast boundary of the Site. The Site falls entirely within the Grand River Watershed; however, drainage just beyond the north and northeast of the Site, is by small streams to Oswego Creek which empties into the Welland River south of Port Davidson approximately 23 km east of the Site.

The area is also characterized by sloughs, which are wet throughout the year, indicating water table discharge zones or areas of surface water collection. The sloughs in this region are believed to be attributable to relatively flat terrain and poor drainage.

2.3 Regional Geology

2.3.1 Overburden Geology

The regional Quaternary geology is presented on **Figure 2.1**.

As shown on **Figure 2.1**, glaciolacustrine clay and silt extensively covers the region (unit 24 – darker purple on **Figure 2.1**). These deposits are quiet water deposits lain down towards the end of the Wisconsinan period when the area was covered by glacial lakes Whittlesey and Warren.

Other younger Wisconsinan deposits located east of the Site include coarser beach sand and gravel (unit 25) overlying the till that derived from nearshore or beach deposits.

The oldest unconsolidated Quaternary deposit in the region is the Late Wisconsinan Wentworth Till (unit 14 on **Figure 2.1**). This is a gravelly silt till that is exposed as drumlins through the overlying glaciolacustrine clay and silt. This deposit extends, beneath the glaciolacustrine deposits, from 9 km southeast of Cayuga towards the northwest across the region, while the southern limit is at the north face of the Onondaga escarpment. This till formation was deposited by the Ontario-Erie glacial lobe, which advanced locally over bedrock in a western and south-western direction across the region.

Figure 2.1 also shows modern fluvial deposits of sand and gravel (unit 31) which has been deposited as a delta at the mouth of the river at the town of Dunnville.

2.3.2 Bedrock Geology

Bedrock geology in the region is illustrated on **Figure 2.2**.

As shown on **Figure 2.2**, the region is underlain by Paleozoic sedimentary rock formations: Dundee, Onondaga, Bois Blanc, Bertie, Salina, and Guelph (listed from southwest to northeast). Rock in these formations are Silurian to Devonian in age (~450 – 350 Mya) and consist of limestone and dolostone with shale and gypsum (evaporite) zones. **Figure 2.1** shows that bedrock outcrops occur west of the Site consisting mostly of Bois Blanc Formation and Onandaga Formation.

According to water well records in the region approximately 12 to 22 m of overburden overlies the bedrock. The bedrock in the water well records is often described as a grey, gravel fractured limestone or a limestone/shale. According to HPE Inc. (1992), the bedrock geology in the immediate area of the Site is dolostone, shale and gypsum of the Salina Formation.

The bedrock surface in the region appears regular in vicinity of the Site with elevations of the bedrock surface ranging between 174 and 186 mAMSL. Bedrock surface elevations appear to decrease on both sides as the Grand River is approached.

2.4 Regional Hydrogeology

Two principal groundwater systems are present in the vicinity of the Site: an upper water table unit and a basal till overburden/shallow bedrock aquifer. Regional groundwater flow within the shallow bedrock aquifer appears to be in a south-westerly direction towards the Grand River. South of the Grand River, groundwater flow appears to be in a north eastward direction indicating a strong river influence.

2.4.1 Groundwater Resource Usage

A domestic water well inventory was carried out in 1992 by HPE Inc. by conducting a house-to-house water well survey for all wells within a 1.5 km radius of the Site. The survey found that 69 percent of the surveyed wells were completed in the bedrock, 18 percent were completed in the gravel underlying clay deposits and 13 percent of the wells were completed in the thin sand and gravel deposit overlying the bedrock. Review of private well inventory and

completion of a ‘road side’ inspection of private properties surrounding the landfill by BRE staff, indicates that there has been only one additional residential home constructed in the area since the 1992 survey. A single home was constructed to the south of the Site off Talbot Road (Highway #3) between 2018 and 2020.

Figure 2.3 illustrates the locations of water wells noted in the MECP’s water well database (accessed June 2022). As shown in the figure three water supply wells are present within 500 m of the Site. Both water supply wells located north of the Site are completed within shallow bedrock (limestone, shale and gypsum) while the on-Site water supply well is completed in the basal till overburden. Details from MECP water wells within 500 m of the Site are summarized in **Table 2.1.**

Figure 2.3 shows a number of water supply wells south of the Site (beyond 500 m). A review of the water well database shows that these wells are completed within the shallow bedrock aquifer (most wells are noted to be completed in limestone).

For reference, **Appendix C** includes copies of the water well records from the MECP database.

It should be noted that the home constructed off Talbot Road is not included in the MECP Water Well Database (as of February 29, 2024).

Well records indicate that the bedrock aquifer provides sufficient yield for private and commercial supply, however water in this aquifer is of poor quality.

Based on the data reviewed, no residential wells in the vicinity of the Site are located within the surficial deposit of native silty clay that form the water table unit. As such, the only aquifer in use in the vicinity of the Site is the basal till overburden/shallow bedrock aquifer, which is located at the base of the thick native silty clay and till deposits.

2.5 Climate

The Site is situated within a continental-type climatic zone. The closest Environment Canada weather station to the Site is the Hamilton A Station located approximately 50 km from Cayuga. According to Environment Canada meteorological data for the period 1959 to 1990, as recorded at the Hamilton A Station, mean daily temperatures typical of the Site range from -6.2°C in January to 17.9°C in July, with a yearly average of 7.6°C. For the 1981 to 2010 period, mean daily temperatures ranged from -5.5°C in January to 20.9°C in July.

Between 1959 and 1990, precipitation recorded as rainfall ranged from a minimum of 22.2 mm in January to a maximum of 84.7 mm in August with a yearly average of 743.3 mm total rainfall. Precipitation recorded as snow ranges from a minimum of 0.0 cm between June and September to a maximum of 41.8 cm in January with a yearly average of 152.4 cm total snowfall. The total average annual precipitation at the Hamilton A Station was reported at 890.4 mm.

Between 1981 and 2010 precipitation recorded as rainfall ranged between 28.2 mm in February and 100.7 mm in July. The average annual rainfall was reported as 791.7 mm. Precipitation recorded as snow ranged from a minimum of 0.0 mm between June and September and a maximum of 40.8 mm in January. The annual average snowfall between 1981 and 2010 is reported to be 156.5 mm.

The total annual average precipitation between 1981 and 2010 was reported to be 929.8 mm/year.

Between 2010 and 2021 precipitation recorded as rainfall ranged between 24.0 mm in February and 106.4. mm in October. The average annual rainfall was reported as 779.17 mm. Average precipitation recorded as snow ranged from a minimum of 0.0 mm between June and September and a maximum of 40.0 mm in January. Between 2010 and 2021 the total average annual precipitation was reported to be 902.4 mm.

A review of weather data records for other nearby weather stations (Dunville, Hagersville, and Simcoe) indicates a similar average annual precipitation and temperature ranges. As such, it is anticipated that the climate data presented at the Hamilton A Station accurately represents Site conditions.

3. Site Physical Setting

The geologic and hydrogeologic setting of the Site has been extensively studied through a number of field investigations completed to support previous landfill expansions and ongoing environmental monitoring. This data has been compiled to describe the physical setting of the Site and immediately surround lands.

3.1 Site Topography and Drainage

The Site is located within the Haldimand Clay Plain, which is characterized by level topography and relatively poor drainage. The stormwater management facility currently consists of perimeter ditching and a surface water management system pond (SWMS Pond). The function of the stormwater management system is to capture stormwater runoff from capped portions of the landfill and surrounding on-Site buffer zones and direct that stormwater to the SWMS Pond by way of perimeter ditching. Stormwater that has contact with waste (i.e., non-capped areas of the landfill) is directed to the leachate collection system within the landfill cell. The SWMS Pond operates as a continuously open pond with an outlet control structure. The location of the SWMS Pond is presented on **Figure 3.1**.

The roadside ditch along the east side of Brooks Road adjacent to the Site drains south through a culvert under the abandoned railway corridor and empties into a small, natural stream channel which is part of the head waters of Norton Creek. Other drainage from adjacent lands to the west of Brooks Road also flows in culverts under Brooks Road to provide surface runoff to Norton Creek. Other surface runoff contributions include ephemeral streams on lands south of the Site that enter Norton Creek via culverts under the abandoned railway corridor.

3.2 Site Geology

Examination of the stratigraphic logs generated from the extensive Site investigations completed by M&B Ltd., 1985; HPE Inc., 1992, and GHD 2001 to 2022 indicate that the overburden geology is relatively uniform beneath the Site. Soil and groundwater investigative locations completed at the Site are illustrated on **Figure 3.1**.

In general, the Site is characterized by a thick (14 to 18 m) glaciolacustrine layer of stratified silty clay and clay, silty clay till, and varved clays (referred to collectively as the native silty clay), underlain by a thin (1 to 3 m) discontinuous layer of silty sand till with varying concentrations of gravel and clay. Bedrock is encountered at depths varying from 15 to 20 mBGS. A thin surficial deposit of topsoil is generally observed at the surface of the Site, except for the southwestern portion, where refuse associated with historical waste disposal activities was observed prior to the redevelopment of the Site in 2012.

The native silty clay deposits are described as being locally fractured (weathered) from the surface down to depths varying from 3 to 5 mBGS and are characterized as a very stiff to hard unit with low plasticity. At depths more than 5 m, the native silty clay deposits have little to no fracturing with a hardness described as stiff to very stiff.

Underlying the native silty clay deposits, a thin discontinuous silty sand till with varying concentration of clay and gravel is encountered across the Site. The silty sand till ranges in thickness from 1 to 3 m and often contains cobbles and/or broken angular bedrock fragments. This deposit is usually well graded/poorly sorted with fine to medium grained sand, minor silt and trace clay, and is described as dense to compact, grey, and saturated. The silty sand till is referred to as a basal till and exists directly over the bedrock.

Bedrock underlying the Site has been identified as a fractured shale, dolostone and gypsum of the Salina Formation. As illustrated on **Figure 3.2**, the top of bedrock elevation ranges from 180.8 to approximately 187.0 m above mean sea level (mAMSL). A small bedrock valley has been interpreted from northwest to southeast across the Site. The small depression is characterized by the thicker silty sand basal till deposit. A bedrock ridge is located on the northern bounds of the small valley with bedrock highs located in the northern portion of the Site.

To illustrate the main geological features of the Site, two cross-sections have been prepared. The locations of the cross-sections are shown on **Figure 3.3** and the cross-sections are presented on **Figures 3.4** and **Figure 3.5**. These cross-sections illustrate the general relationship of overburden thickness/stratigraphy and top of bedrock position.

Detailed descriptions of the geology encountered in boreholes advanced at the Site are presented in the Stratigraphic and Instrumentation logs presented in **Appendix D** (2013-onwards). For reference, the monitoring well and borehole completion details for all investigation locations are summarized on **Table 3.1**. **Table 3.2** provides a summary of the bedrock surface elevations across the Site.

3.2.1 Native Silty Clay Overburden Characteristics

Previous investigations have included laboratory analyses to characterize the overburden soil at the Site. As described above, overburden in the Region generally consists of silty clay glaciolacustrine deposits, silty clay till, or varved clay. Results of the extensive subsurface investigations at the Site concur with this. Thus, overburden soil characteristics are generally comparable across the Site and historic soil characterization analyses is inferred to be representative of the proposed expansion area to the north. Previous analyses have included grain size analyses, estimates of hydraulic conductivity based on Hazen's analysis, analyses for cation exchange capacity (CEC), fraction of organic carbon (FOC), and mineralogical assessments. In addition, geotechnical analyses have been completed on selected soil samples, including moisture content, bulk density and Atterburg limits (Design and Operations Report, CRA, October 2002). For references the geotechnical analyses have been included as **Appendix E**.

Given the consistency of overburden soils, the following characterizes the overburden at the Site and provides an overview of the analysis described in the 2002 Hydrogeologic Performance Assessment (CRA, 2002). Refer to the 2002 report for a more detailed discussion.

Grain Size

Select grain size analyses results identified a stratified silty clay unit extending from the shallow overburden down to at least 10 metres below ground surface (mBGS), and silty sand till with trace gravel and clay in the deeper overburden (at depths in excess of 13 mBGS).

The grain size distribution obtained for the silty clay unit is consistent with prior results and indicated that the deposit is generally composed of 60 percent clay size particles. Based on the results of the grain size analyses carried out to date, the grain size distribution of the silty clay material encountered down to depth of 13 mBGS is very consistent. The material is therefore characterized as being relatively homogeneous.

Cation Exchange Capacity

The cation exchange capacity (CEC) of a soil is a measure of the ability of the soil to remove cations (positively charged ions) from groundwater which migrates or travels through the soil. The CEC is dependent on the type and amount of clay present in the soil as clay minerals typically have a deficiency of cations and therefore, an ability to absorb (adsorb) cations from the groundwater. Leachate generated at landfill sites is typically elevated in cations. Thus, the CEC values are used to estimate the capability of soils, situated beneath or in the vicinity of landfill sites, to retard the vertical and lateral migration of leachate derived cations.

The results of the CEC analyses indicate that the CEC of the silty clay ranges from 287.1 to 288.4 meq/100 grams, while the CEC of the silty sand till in the deeper overburden was reported at 85.4 meq/100 grams. The CEC values for the Site indicate that the native silty clay observed in the shallow overburden has a high ability to retard cation migration, while the silty sand till located in the deep overburden has a moderate to high ability to retard cation migration.

Fraction of Organic Carbon

The capability of soils to attenuate the migration of organic compounds is in part a function of the organic content of the soils. The results of past FOC analyses show that the FOC of the silty clay ranged from <0.03 to 0.615 percent, with an average value of about 0.3 percent. The FOC of the silty sand till was measured to 0.26 percent.

The FOC values of the samples analyzed indicate that the overburden material (native silty clay and the silty sand till) has a relatively low capability to attenuate the migration of organic compounds.

3.3 Site Hydrogeology

In general, the geologic units identified at the Site may be grouped into two main hydrogeologic units separated by the thick silty clay aquitard unit, as follows:

i) An unconfined water table (shallow overburden) unit within shallow fractured portion of the native silty clay (weathered) unit

ii) Native silty clay aquitard

iii) A confined basal till overburden/shallow bedrock aquifer

The two hydrogeologic units (unconfined water table within the fractured native silty clay and the confined basal till overburden/shallow bedrock aquifer) are separated by a thick (between 9 and 15 m) layer of stratified silty clay, silty clay till, and varved clays which form an aquitard of very low hydraulic conductivity (native silty clay aquitard). Groundwater level data historically gathered from the shallow overburden unit and basal till overburden/shallow bedrock aquifer indicate that the presence of the silty clay aquitard results in hydraulic separation of the two units. A hydraulic head difference varying from 9.5 to 15 m has been historically measured at the location of nested wells.

3.3.1 Shallow Water Table Unit

The water table unit is contained within the fractured (weathered) silty clay unit. The hydraulic conductivity of the weathered portion of the silty clay unit has been estimated at approximately $2.3x10^{-6}$ cm/s. Based on the groundwater data, the water table unit is generally encountered at depths varying from 0.5 to 4 mBGS. Horizontal hydraulic gradients within the water table are relatively flat, making determination of a precise or consistent flow direction difficult. Notwithstanding, groundwater flow within the water table unit has generally been interpreted to be to the south toward Lake Erie.

Based on the hydrogeologic characteristics of the water table unit, and assuming an overall effective porosity of 30 percent, horizontal linear groundwater velocities of between 0.02 to 0.24 m/year have been estimated.

For reference, the attached **Table 3.3**, includes a summary of the hydraulic conductivity testing results completed at the Site. **Table 3.3** is inclusive of the testing completed in the shallow water table unit, silty clay aquitard, and basal till overburden/shallow bedrock aquifer units (described below).

3.3.2 Native Silty Clay Aquitard

The native silty clay aquitard encountered beneath the water table unit consists of a stratified unweathered silty clay, silty clay till, and varved clay deposits, which are generally characterized as being stiff to hard with little to no fracturing. The fractured portion of the native silty clay aquitard extends to between 3 to 5 mBGS. Thus, the competent, unfractured, native silty clay aquitard varies in thickness from 9 to 15 m and is further defined by a low to medium plasticity as well as a very low hydraulic conductivity. In-situ field testing and laboratory analyses performed on the various units forming the silty clay aquitard have provided a hydraulic conductivity range of $1x10^{-6}$ to $1.4x10^{-8}$ cm/s. The vertical hydraulic conductivity was determined to be approximately $1.4x10^{-8}$ cm/s through laboratory testing of an undisturbed silty clay sample collected at a depth of 12.2 mBGS (HPE Inc., 1992).

Groundwater level data from the water table unit and basal till overburden/shallow bedrock aquifer indicate that the presence of the native silty clay aquitard results in hydraulic separation of the two units. Differences in piezometric head of greater than 10 m are frequently observed between the water table unit and deep basal till overburden/shallow bedrock aquifer as measured at various on-Site nested monitoring wells.

3.3.3 Basal Till Overburden/Shallow Bedrock Aquifer

Underlying the native silty clay aquitard, a confined basal till overburden/shallow bedrock aquifer exists within the lower portion of the silty sand till unit and the shallow fractured bedrock. Groundwater quality and water level data historically gathered from monitoring wells screened within the lower silty sand till unit exhibited similar hydrostatic levels and hydrochemical characteristics which are not substantially different from samples obtained from well nests screened solely with the shallow bedrock. Therefore, these two geological units have been generally considered to form one aquifer. The average hydraulic conductivity of the basal till overburden/shallow bedrock aquifer has been calculated to be approximately $1.4x10^{-4}$ cm/s, based on in-situ field-testing.

The deep basal till overburden/shallow bedrock aquifer is encountered at depths varying from 14 to 18 mBGS. The groundwater flow pattern of this aquifer is overall towards the south or southwest. Horizontal hydraulic gradients within this unit are generally very flat, typically ranging between 0.0002 and 0.004 m/m.

Based on the hydrogeologic data, the horizontal linear groundwater velocity within the deep basal till overburden/shallow bedrock is estimated to be approximately 0.3 m/year toward the southwest.

The following figure provides a conceptual schematic illustration of the geologic and hydrogeologic setting of the Site.

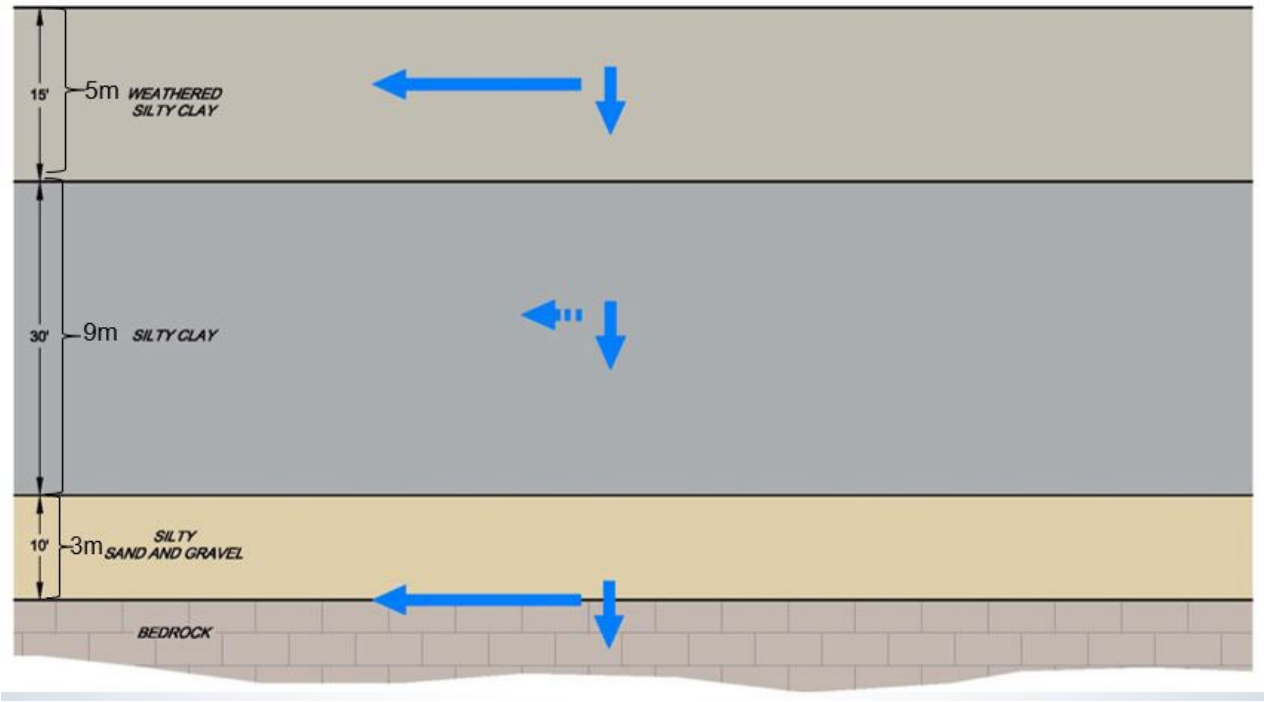

Figure 3.6 Conceptual Site Geology and Hydrogeology

4. Natural Gas, Mines, and Karst Considerations

4.1 Natural Gas Deposits and Natural Gas Wells

A review of oil, gas and salt resource mapping in Ontario indicates that active and plugged gas wells are located within the vicinity of the Site. No active/plugged gas wells were identified on the Site, however research indicates that 23 current and former gas wells are located within the vicinity of the Site. A total of 16 gas wells have been identified

as abandoned, of which 15 have been identified as plugged, and a total of seven gas wells that may be active, suspended, or abandoned are found within the vicinity of the Site. The gas wells all targeted the Haldimand Pool within the Clinton Group and were drilled to a total depth (true vertical depth) ranging from 207.6 to 229.5 mBGS at approximately the top of the Queenston Formation. An east west trending natural gas pipeline is also located approximately 400 m south of the Site. A list of the Ontario Oil and Gas Wells located within the vicinity of the Site is itemized in **Table 4.1**. The locations of the oil and gas wells are illustrated on **Figure 3.7.**

Due to the depths of the natural gas wells, it is not anticipated that there would be any influence from the landfill on the natural gas wells.

4.2 Mining Claims and Abandoned Mines

A review of the Ministry of Northern Development and Mines (MNDM) information for abandoned mines and mining claims was completed. No mining claims were identified within the vicinity of the Site, however one abandoned mine was identified to the northwest of the Site (AMIS File # 04888 / MDI # MDI30L13NW00003). The mine was reviewed in a CRA report entitled Well Survey and Limited Hydrogeological Assessment, dated July 2004 (2004 Report). The 2004 Report indicates two documents were reviewed: Gypsum in Ontario, C.R. Guillet, dated 1964, and Abandoned Mines Hazard Abatement Program, London District Site Examinations, prepared by Patrick Chance & Associates Consulting Geologists, dated 1994 (1994 Inspection). The information presented below was gathered from the above-referenced reports and has been revised with the most current information available including information from the Gypsum Mine Investigation Report prepared by GHD in 2016 that provides an assessment of potential influences of the former Cayuga Gypsum Mine on groundwater at the landfill Site.

The former gypsum mine was operated by the Cayuga Gypsum Company Limited between 1942 and 1949. Gypsum was mined from a 0.9 m thick bed at a depth of 25.9 mBGS.

Mining operations were accomplished via two mine shafts. The first shaft was located approximately 112 m south of Townline Road and 350 m west of Brooks Road. The former shaft can reportedly be located by a 2.4 m deep depression, with a footprint of 3.0 by 4.6 m. The shaft was a vertical prospect shaft of unknown support and was back-filled with unknown materials. The 1994 Inspection did not document any evidence of subsidence; however, the report recommended that a 50 m radius area of caution be observed in the vicinity of this shaft.

Based on the available historical documentation, approximately 10,300 tonnes of gypsum was reportedly removed from this prospect shaft during the operation of the mine. With a density of 2.3 tonnes/m^3 and a thickness of 1 m, this would correspond to lateral workings with an aerial footprint of approximately 4,356 square metres (m^2). In order to access the gypsum in the ~1 m seam, it is likely that approximately 1-2 m of the overlying shale bedrock would also have been removed.

The second shaft was located approximately 305 m south of the first shaft. The 1994 inspection was reportedly unable to locate the second shaft. The second shaft was also a vertical prospect shaft of unknown support and it is unknown if the shaft has been back-filled. It is not known how much gypsum was removed from this shaft.

Due to property access restrictions, an inspection of the former Cayuga Gypsum Mine could not be conducted.

During the operation of the mine from 1942 to 1949, dewatering operations would likely have been conducted to keep the mine shafts and associated galleries dry. As such, during the operation of the mine the local groundwater flow would have been influenced by mine dewatering activities. Active removal of large quantities of groundwater from the bedrock would have resulted in inward hydraulic gradients. As such, the bedrock groundwater flow in the vicinity of the former mine would have been directed towards the active galleries during operation of the mine.

Upon closure of the mine in 1949, the dewatering activities at the mine would have ceased and the associated mine shafts and galleries would have flooded within a short period of time after closure. The mine has now been abandoned for over 70 years. Since the former galleries and shafts are flooded, no water deficit should be present between these former underground structures and the surrounding bedrock. Thus, essentially steady state conditions should exist, and the former underground structures will no longer have a hydraulic influence on the local bedrock aquifer.

In the unlikely event that the former mine shafts would not have been properly sealed following closure of the mine, there could exist the potential for surface water and groundwater in the shallow overburden to enter the mine shafts and migrate to the underlying bedrock aquifer. If infiltration were occurring, the shafts would be acting as a sink to the overburden groundwater and a source of recharge to the local bedrock groundwater. This would result in a cone of depression in the overburden groundwater towards the former mine shafts and radial flow from the galleries in the bedrock groundwater. Under this scenario there could be a potential for bedrock groundwater flow being diverted away from the former galleries. However, based on the relatively small dimension of the former galleries (areal extent of approximately 4,356 m2) it is expected that any influence of these galleries on the bedrock aquifer would be localized to the immediate vicinity of the former galleries. Bedrock aquifer influence beyond the limits of the former Cayuga Gypsum Mine property is anticipated to be negligible.

The Gypsum Mine Investigation Report reviewed information related to historical mining operations including location and extent of mining activities, review of physical site conditions for evidence of historical mining operations, and an evaluation of hydraulic gradients within the available monitoring network to identify potential evidence of a hydraulic influence on horizontal or vertical gradients in the vicinity of the Site. The report concluded that there is no evidence of an influence related to the former Cayuga Gypsum Mine on the bedrock aquifer at the Site.

4.3 Karst

A review of the Ontario Geological Survey Karst of Southern Ontario and Manitoulin Island report indicates that no potentially karst, inferred karst, or known karst bedrock has been identified within the 1KM of the Site. Furthermore, the groundwater conditions are unfavourable for the dissolution of the bedrock and bedrock consists of generally argillaceous dolostone, shale, and evaporites (primarily gypsum), the latter of which precludes the formation of large-scale karst features. Furthermore, no sink holes or caving features have been identified with 1 km of the Site.

5. Residual Site Impact Assessment

The following sections have been updated from previous assessment of residual site impacts to focus on current leachate quality within the engineered landfill and current groundwater and surface water quality surrounding the lined landfill footprint.

5.1 Leachate and Groundwater Quality

Since the Site was redeveloped, leachate generated from within the lined waste cells is conveyed into the Leachate Collection System (LCS) and flows by gravity to a sump located in the southeast corner of the landfill base. The leachate is pumped from the sump to a storage tank for on-Site treatment and/or off-Site disposal.

Leachate quality has been monitored on an annual basis since 2011 to characterize leachate source contaminants and concentrations. Understanding the characteristics of leachate is important for identifying potential leachate impacts to groundwater and surface water outside the waste footprint,. Leachate samples are analyzed for general chemistry, metals, PAH, and VOCs. The following **Table 5.1** summarizes recent (2021) leachate concentrations in comparison to historical concentration ranges and the corresponding Ontario Drinking Water Standards (ODWS) where available:

Table 5.1 Leachate Character

Parameters	Units	2021 Results	Historical (2011-2021) Concentration Range	Comparative ODWS
Alkalinity	mg/L	820	820 – 3,700	30 – 500 (OG)
Chloride	mg/L	1,130	555 – 1,440	250 (AO)

Parameters	Units	2021 Results	Historical (2011-2021) Concentration Range	Comparative ODWS
DOC	mg/L	188	15.6 – 767	5 (AO)
Hardness	mg/L	1,640	1,560 – 2,310	80 – 100 (OG)
Sulphate	mg/L	287	26 – 1,490	500 (AO)
TDS	mg/L	4,120	2,980 – 5,800	500 (AO)
Aluminum	mg/L	<0.50	0.063 – 1.69	0.1 (OG)
Arsenic	mg/L	0.030	0.030 – 69	0.010 (MAC)
Boron	mg/L	10.0	4.97 – 16.1	5.0 (IMAC)
Chromium	mg/L	<0.050	0.016 – 0.058	0.050 (MAC)
Iron	mg/L	<1.0	<0.10 – 7.51	0.30 (AO)
Lead	mg/L	<0.0050	<0.00050 – 0.0088	0.01 (MAC)
Manganese	mg/L	--	0.249 – 3.04	0.05 (AO)
Sodium	mg/L	716	255 – 843	200 (AO)
Benzene	µg/L	3.40	<0.8 – 4.3	1 (MAC)
Ethylbenzene	µg/L	8.31	<1.00 – 11.5	2.4 (AO) / 140 (MAC)
Toluene	µg/L	1.06	1.06 – 41	60 (AO)
Benzo(a)pyrene	µg/L	<0.010	<0.010 – 0.085	0.01 (MAC)
Naphthalene	µg/L	8.12	2.1 – 11	--
Phenanthrene	µg/L	0.411	0.217 – 4	--
Notes: '—' indicates that no information available				

In general, the current landfill leachate is characterized by elevated conductivity, alkalinity, chloride, DOC, hardness, phenolics, phosphorus, TDS, arsenic, boron, and iron.

Benzene, cis-1,2-dichloroethene (cis-1,2-DCE), ethylbenzene, xylenes (m&p, o), toluene, 1-Methylnaphthalene / 2-Methylnaphthalene, acenaphthene, anthracene, fluoranthene, fluorene, naphthalene, and phenanthrene are also commonly detected in leachate at the Site.

5.2 Contaminants of Concern

Site-specific leachate contaminants of concern are listed below. Individual general chemistry and metals parameters have been identified based on elevated concentrations in leachate at the Site. The presence of organic parameters in leachate may be used in identifying potential leachate impacts to groundwater in general. Specific VOC and PAH parameters have been identified based on elevated concentrations in leachate and low drinking water standards in groundwater.

– General Chemistry: alkalinity, boron, chloride, DOC, hardness, sodium, TDS
– Metals: arsenic, boron, cadmium, iron;
– VOCs: particularly BTEX and vinyl chloride; and
– PAHs: Particularly benzo(a)pyrene, fluorene, naphthalene, phenanthrene

5.3 Groundwater Quality

Groundwater quality has been monitored in each of the hydrogeologic units on a semi-annual basis following the early 2000's modernization of the Site as described in the Design and Operations Report (CRA, October 2002) and the Hydrogeologic Performance Assessment (CRA, October 2002). Samples are typically analyzed for general chemistry, metals, PAH, and VOCs.

In 2015, GHD undertook a review of the available database of groundwater and leachate quality data for the Site in order to develop a Site-specific Trigger Level Program (TLP) and Contingency Response Plan (CRP). An updated Design and Operation report was submitted and approved in December 2018 which included the TLP and CRP. The purpose of the TLP is to provide timely identification of potential Site-related water quality impairment and in turn permit implementation of appropriate contingency measures to mitigate the potential for water quality non-compliance.

Groundwater at the Site is generally assessed by comparing spatial and temporal trends between leachate and upgradient and downgradient groundwater monitoring locations. Groundwater compliance at the Site is assessed by comparing Site boundary groundwater quality to Site-specific Reasonable Use Concept (RUC) criteria. The RUC criteria are calculated from generic ODWS and background concentrations. For the purposes of the TLP, 85 percent of the Site-specific RUC criteria have been used as trigger levels. Accordingly, the TLP is intended to provide advance warning of potential Site groundwater compliance issues.

Shallow overburden water quality is currently assessed using groundwater quality data collected from ten on-Site shallow overburden wells (MW1B-13, MW2B-07, OW1B-06, OW3B-13, OW5B-06, OW8B-06, OW9B-06, MW10B-18, MW11B-19, MW12B-19) and two off-Site shallow overburden wells (MW5B-09, MW6B-07). Basal till overburden/shallow bedrock water quality is also monitored semi-annually and water quality is assessed based on groundwater monitoring data collected from ten basal till overburden/shallow bedrock monitoring wells. Of these monitoring wells, ten are located throughout the Site (MW1A-13, MW2A-01, OW1A-06, OW3A-13, OW5A-06, OW8A-06, OW9A-06, MW10A-18, MW11A-19, MW12A-19), and two off-Site basal till overburden/shallow bedrock monitoring wells (MW5A-09, MW6A-07) which are located approximately 150 m south of the Site.

The locations of the Site's groundwater monitors are illustrated on **Figure 3.1**.

Natural background water quality within the on-Site shallow overburden unit is generally characterized by elevated levels of alkalinity, hardness, DOC, TDS, sulphate, and iron. The basal till overburden/shallow bedrock unit is characterized by naturally elevated levels of sulphate, hardness, TDS, iron, and manganese.

With the exception of OW8B-06, shallow groundwater monitors at and surrounding the Site have demonstrated water quality in compliance with the Site's TLP which is generally consistent with background water quality.

Elevated sodium, chloride and TDS (with chloride above the Site's RUC) are noted in the shallow overburden unit at on-Site monitoring well OW8B-06. Water quality impacts are interpreted to be due to the road-salt impacts as this well is located in close proximity to Brooks Road. Concentrations of benzo(a)pyrene (often above RUC limits) have also been noted in the groundwater sampled from the shallow overburden unit at on-Site monitoring well OW8B-06. Detectable PAHs, including benzo(a)pyrene at OW8B-06 are interpreted to be related to historic slag stockpiles in the vicinity of the Site and the use of road ballast along the Site entrance. The landfilled waste is not interpreted to be the source of detectable PAHs in groundwater at OW8B-06.

Similar to the shallow overburden, water quality results from the basal till overburden/shallow bedrock have shown no evidence of landfill related impacts as all monitoring results have been below trigger levels and have shown water quality comparable to background.

6. Hydrogeologic Assessment of Proposed Landfill Design

The following sections present a hydrogeologic assessment of the proposed landfill expansion design. The assessment has been undertaken to evaluate the expansion design with respect to its potential effect on downgradient receptors in terms of groundwater quality. Considerations included as part of this assessment include:

– Characteristics of the proposed landfill expansion design;
– Evaluation of the quality of the native silty clay deposits for use as a natural attenuation layer (thickness, homogeneity, and hydraulic conductivity);
– Assessment of existing leachate character;
– Receptors of concern;
– Vertical and horizontal contaminant migration; and
– Predictive modelling of future Site performance.

6.1 Landfill Design

The Brooks Road Landfill, including the proposed expansion, has been designed to ensure appropriate protection of the surrounding environmental. The landfill expansion will include an additional stage of landfilling, Stage 9, to the north of the existing approved landfill footprint. This expansion will provide an additional 219,400 m^3 of landfill capacity that will be filled following the Stage 5 through 8 of the vertical expansion.

The existing approved landfill footprint area is approximately 60,705 m^2 (6.07 ha). The Stage 9 expansion area includes an additional 10,230 m^2 (1.02 ha). If approved, the final landfill footprint will be 71,461 m^2 (7.15 ha).

Based on the final contours (refer to the accompanying Design and Operations Report, GHD, 2024), the expanded landfill footprint will include a minimum buffer width of 30 m between the east and west Site boundaries and the landfill footprint, 42 m between the north boundary, and a minimum 37 m between the south-eastern corner of the landfill footprint and the Site boundary.

The base design for the existing landfill stages has been maintained for the Stage 9 expansion area and includes: a woven geotextile overlying a drainage layer (for leachate collection), which will overlie a non-woven geotextile and a 60-mil thick, textured, high density polyethylene (HDPE) liner, which will, in turn, overlie a 750 mm thick engineered clay layer. The engineered clay will be placed and compacted using on-Site soil excavated from the silty clay aquitard during the construction of the landfill and will have a hydraulic conductivity equal to or lower than the native on-Site silty clay aquitard (i.e. $2x10^{-8}$ cm/sec).

The base of the Stage 9 expansion will be consistent with the existing landfill base and will extend to a maximum depth of approximately 10 mBGS with a base bottom that will be excavated into the silty clay aquitard unit.

The landfill base is designed with a leachate collection system that overlays the composite HDPE/clay liner. The leachate collection system will consist of a stone layer placed over the base of the landfill at a minimum thickness of 0.3 m on the base side slopes and a minimum thickness of 0.5 m elsewhere. A non-woven geotextile will be installed between the stone layer and the underlying liner and the overlying waste. Leachate collection pipes will be made of HDPE and will be 200 mm in diameter with perforations 12 mm in diameter located along the length and around the circumference of the pipe.

The leachate collected by the leachate collection system will be removed from the sump being the low point in the collection system on a continuous basis through pumping. Leachate will be directed, via buried forcemain, to a storage tank for on-Site treatment and/or off-Site disposal.

6.2 Use of the Native Silty Clay Aquitard as a Landfill Base

The design of the landfill cells is based on the availability of low permeability material to ensure that the base of the landfill as well as the composite liner can conform to the design requirements.

The native silty clay aquitard, into which the landfill base has been installed, consists of a stratified unweathered silty clay, silty clay till, and varved clay deposits as described in Section 3.3.2. As described in Section 3.3.2, the native silty clay aquitard is of sufficient thickness, low hydraulic conductivity, and geotechnical character to provide a natural barrier that is protective of the basal till overburden/shallow bedrock aquifer.

The natural soil characteristics of the native silty clay aquitard; low to medium plasticity, low sensitivity and low activity indicate that the natural silty clay is not sensitive to disturbance and can be placed and compacted by equipment commonly used in earthworks projects. No significant difficulties were encountered during previous landfill cell construction operations at the Site and none are expected with the Stage 9 expansion.

Based on the hydrogeologic and geotechnical data, the natural silty clay to be excavated can be used to construct the clay liner and achieve the design hydraulic conductivity value of 2×10^{-8} cm/s, provided a good bond is achieved between successive compacted layers. The silty clay used in the construction of the liner will be at moisture contents at or just above (plus 1 to plus 3 percent) the optimum moisture content as determined in the standard proctor test. The silty clay will be placed in lifts consistent with the size of sheepsfoot roller (not exceeding 200 mm in thickness) and uniformly compacted to a minimum of 98 percent of the standard proctor maximum density.

6.3 Leachate Characteristics

As defined in the ECA (Waste), the landfill has accepted solid non-hazardous Industrial, Commercial and Institutional waste (IC&I waste). The waste stream will not change for the expansion area and so the leachate character described in Section 5.1 is expected to be representative of future leachate generated across the landfill.

The leachate is characteristic of land clearing and construction and demolition waste landfills (C&D or IC&I landfills). Based on the nature of waste normally found in ICI landfills (wood, small amounts of steel, asphalt shingles, and construction debris) the quality of ICI leachate is generally much weaker in comparison to leachate from municipal landfill and also tends to have a lower organic content. As a general rule of thumb, ICI leachate is often established at less than half the strength of municipal waste landfill. Non-hazardous contaminated soil may contain a variety of contaminants depending on the source of the waste material. Common soil contaminants include metals, polycyclic aromatic hydrocarbons (PAHs), volatile organic compounds (VOCs) and petroleum hydrocarbons (PHCs). The leachability of the contaminants in non-hazardous contaminated soil is low compared to hazardous waste that may contain elevated concentrations and potentially include free-product. Asbestos-Containing Material (ACM) does not affect the quality of the leachate in terms of impacts from the asbestos material, as asbestos does not have the leachability characteristic that distinguish hazardous chemicals. Once landfilled, ACM is an inert material.

6.4 Predictive Flow and Transport Modelling

To assess the potential degradation of on-Site and off-Site groundwater quality via leakage through the base of the landfill liner and the underlying native silty clay aquitard, a mathematical evaluation of the vertical and horizontal migration potential of various landfill indicator contaminants using standard groundwater modelling procedures adapted to the hydrogeological setting and the landfill design has been undertaken.

The objective of the models is to simulate the quality of the groundwater leaching into and then migrating within the deep basal till overburden/shallow bedrock aquifer underlying the base of the landfill. To simplify the model and to provide a security factor to the simulation results, no attenuation factors (such as chemical, and biological processes including, adsorption, biodegradation, cation and anion exchange, filtration, and precipitation) that commonly occur

between the clayey soils and the leachate constituents were incorporated into the simulation. As such the model is considered to be conservative, as it will overestimate the rate of contaminant movement.

The model used for the purposes of the vertical migration simulation is similar to the model used to test the hydrogeological feasibility of the design as part of the hydrogeologic performance assessment undertaken in support of the original Design and Operation (D&O) Plan (CRA, 2004) and the Leachate Trigger Level Plan (GHD, 2019) which have previously been approved for the Site.

The vertical migration of contaminants from the base of the landfill through the composite liner (composed of the HDPE liner and compacted clay) and the underlying native silty clay was simulated with a one-dimension advection-dispersion model. An adaptation of the 1DTRANSEN model, developed by Dr. N.R. Thomson, was selected as the vertical migration model for the Site for the following reasons:

– The model includes the dominant contaminant transport processes (advection and dispersion)
– The model is a flexible and allows for variation in source characterization and failure scenarios
– the model has been verified and validated
– the model was used as the basis for the original hydrogeologic assessment of liner performance and thus formed one of the bases for approval of the Site design

In order to provide a conservative assessment of the mobility of leachate derived contaminants at the Site, the landfill was modelled under 2 different scenarios. The first scenario involved 6 m of leachate mounding over the composite liner for 50 years, followed by complete failure of the HDPE liner. In this scenario, the leachate collection system and the HDPE liner were modelled with a service life of 50 years in order to maintain consistency with the previously modelled failure scenario. Following the 50-year service period, the HDPE liner was removed from the liner system and the leachate head was maintained at 6 m above the base of the collection system.

The second scenario modelled the effect of 6 m of head on the liner system with the HDPE liner entirely absent for the duration of the model.

GHD has completed the predictive modelling using leachate quality consistent with measured leachate concentrations from 2017-2021. Peak concentrations have been used to be conservative. Previous predictive modelling employed expected leachate characteristics using leachate quality from nearby landfills with similar waste streams (2002 Hydrogeologic Assessment (CRA, 2002) and the Leachate Trigger Level Plan (GHD, 2019). The following predictive model uses leachate quality reported at the Site since 2011. Indicator parameters were chosen based on comparing leachate quality to background groundwater quality in order to identify leachate constituents that are elevated in leachate but not in groundwater. Further, indicator parameters have been chosen to represent the major analyte categories (general chemistry, metals, VOCs, and PAHs). To conservatively assess the hydrogeologic performance of the landfill expansion and potential leakage through the landfill liner, peak or maximum concentrations reported in leachate have been used to represent leachate generated at the Site.

Table 6.1 below, presents a summary of input parameters for the vertical migration simulation scenarios.

Table 6.1 Vertical Migration Model Input Parameters

Source Concentration					
Indicator Parameters	Initial Source Concentration	Decay Function[(1)]			Diffusion Coefficient (m^2/year)
		T1	T2	x	
Chloride	1,130 (mg/L)	1.5	6	-0.065	0.06402
Boron	10.1 (mg/L)	1.5	6	-0.125	0.07030
Cadmium	0.0005 (mg/L)	1.5	6	-0.125	0.06402
Benzene	4.27 (µg/L)	1.5	6	-0.139	0.03237
Vinyl Chloride	0.76 (µg/L)	1.5	6	-0.069	0.03786

Source Concentration					
Fluorene	0.544 (µg/L)	1.5	6	-0.069	0.02488
Phenanthrene	0.492 (µg/L)	1.5	6	-0.069	0.01395
Underlying the Leachate Mound					
Material	Hydraulic Conductivity		Average Thickness		Porosity
HDPE Liner	1 x 10^{-11} cm/s		1.5 mm		0.3
Compacted Clay liner	2 x 10^{-8} cm/s		0.75 m		0.3
Native Silty Clay	2 x 10^{-8} cm/s		5.6 m		0.3
Modeling Scenario					
Scenario	Time Frame		HDPE Liner Condition		Leachate Head
1	From 0 to 50 years		HDPE Liner is good		6 m
	After 50 years		HDPE Liner has failed		6 m
2	From 0 to 50 years		No HDPE Liner		6 m
	After 50 years		No HDPE Liner		6 m
Notes: Decay function were obtained from Lu et al. (1981) and Rowe (1994) – described below.					

The general decay function provided by Lu et al. (1981) and Rowe (1974) is presented below:

$$\frac{C(t)}{C(0)} = e^{-x(T1-T2)}$$

C(t)	Contaminant concentrations at time t (mg/L or µg/L)
C(0)	Initial source contaminant concentration (mg/L or µg/L)
X	Diffusion coefficient
T1 and T2	Temporal boundary conditions: T1 is set to a 0-1.5 years to represent initial conditions; T2 is set to 1.5-6 years an assumed period of increasing concentrations as contaminants leach from the source material; after T2, concentrations exponentially decay

The results of the vertical model are presented in **Table 6.2** below:

Table 6.2 1Dtransen Model Results

Notes:

BOLD – anticipated exceedance of the RUC (2017-2021)

Peak concentration and time required to reach peak concentration were obtained using 1DTRANSEN transport model

Average Median concentrations from 2017-2021 from background monitoring wells MW1A-13, OW3A-13, and OW9A-06 have been used to calculate the RUC and average background concentrations presented above.

ND - Parameter not detected above Method Detection Limit (MDL).

Half of the MDL has been used in the RUC calculations

Time series graphs presenting the variation in concentrations of the source, as well as the projected concentration at the base of the native silty clay are presented in **Figures 6.1 and 6.2** for Scenarios 1 and Scenario 2.

Based on the results of the conservative vertical migration simulation scenarios using current leachate quality from the Site, the peak concentrations of chloride and benzene are predicted to marginally exceed the calculated Site-specific RUC criteria upon entering the basal till overburden/shallow bedrock aquifer.

As previously discussed, the projected quality of the groundwater leaching from the base of the native silty clay aquitard unit was modelled using a direct adaptation of the advection-dispersion equation with no input for soil/leachate interaction/degradation, which would further reduce the peak levels reported. The following section presents the results of the horizontal migration simulation. As is discussed in this section, additional attenuation of the peak concentrations will result from the combination of the minor quantities of vertical leakage entering the basal till overburden/shallow bedrock aquifer horizontal flux.

6.5 Horizontal Migration Simulation

Following vertical migration by advection and diffusion through the composite liner and native silty clay aquitard deposit, leachate impacted groundwater will eventually reach the basal till overburden/shallow bedrock aquifer at the concentrations and vertical flux presented in **Table 6.3**. From that point the attenuated leachate contaminants will be further attenuated by mixing with horizontal bulk groundwater flow of the basal till overburden/shallow bedrock aquifer beneath the landfill footprint.

Beyond the downgradient limit of the landfill footprint, the attenuated contaminants in the basal till overburden/shallow bedrock aquifer will further mix with downgradient infiltration recharge. The infiltration recharge downgradient of the landfill footprint will further attenuate by dilution any residual leachate derived parameters present in the groundwater prior to off-Site migration.

The contaminant attenuation model utilized to assess the predicted contaminant concentration at the Site boundary within the basal till overburden/shallow bedrock aquifer consisted of a simple mass balance model. A mass balance

model was selected as the preferred modeling approach for the horizontal simulation within the basal till overburden/shallow bedrock aquifer for the following reasons:

– This method is very conservative and uses only dilution for attenuation; and
– The hydrogeological setting of the Site is well understood.

The following subsection outlines the relationship between upgradient groundwater flux flowing into the Site and combining with the vertical flux of leachate impacted groundwater into the basal till overburden/shallow bedrock aquifer. This mass balance simulation provides a conservative estimate of the projected groundwater quality at the downgradient Property boundary. As previously indicated no other chemical, and biological attenuation processes that will occur were incorporated into the simulation.

6.5.1 Upgradient Groundwater Flux

The saturated thickness of the basal till overburden/shallow bedrock aquifer immediately upgradient of the proposed design landfill footprint is approximately 5 m based on the current groundwater levels and the geological data presented in the stratigraphic and instrumentation logs. Taking into account the saturated thickness of the aquifer, an estimate of the volume of groundwater (groundwater flux) migrating across the 2-dimensional plane on the upgradient side of the landfill footprint can be made from the following equation (Darcy's equation):

$$Q = KiA$$

where:

Q: is the groundwater recharge (m^3/s);

K: is the hydraulic conductivity of the aquifer material (m/s);

i: is the horizontal hydraulic gradient (m/m); and

A: is the cross-sectional area across which groundwater flow is occurring (m^2).

As previously noted, the hydraulic conductivity of the basal till overburden/shallow bedrock aquifer is approximately 1.4×10^{-4} cm/s, while a horizontal hydraulic gradient of approximately 0.002 m/m has been calculated for the basal till overburden/shallow bedrock across the Site. Based on a unit width of 1 m, the anticipated upgradient recharge to the basal till overburden/shallow bedrock aquifer is calculated at 0.44 m^3/year (per unit width). The upgradient width of the landfill is approximately 365 m which results in 161 m^3/day of groundwater flux flowing beneath the landfill footprint. The groundwater quality (for indicator parameters) upgradient of the landfill footprint will be consistent with average groundwater quality established for the deep basal till overburden/shallow bedrock aquifer.

6.5.2 Leachate Derived Groundwater - Vertical Flux

An estimate of the projected leachate derived groundwater flux into the basal till overburden/shallow bedrock aquifer through the silty clay aquitard was presented in Section 6.4. The estimated vertical flux is based on the proposed final landfill footprint and conservative assumption that there would be 6 m of leachate head across the entire liner system. The results of the simulation indicated a vertical flux of leachate impacted groundwater entering the basal till overburden/shallow bedrock aquifer at a rate of 0.021 m/year per unit area (m/year/m^2).

The total area of the landfill, including the proposed expansion footprint, is approximately 7.15 ha which results in a total leachate derived groundwater loading to the basal till overburden/shallow bedrock aquifer of 3.9 m^3/day or approximately 3,900 L/day.

6.5.3 Projected Groundwater Quality at the Site Boundary

The simulated failure scenario groundwater quality in the basal till overburden/shallow bedrock aquifer at the downgradient boundary of the Site was evaluated through a mass balance approach, where the previously defined upgradient and leachate derived groundwater fluxes and their corresponding contaminant concentrations were inputted. The projected concentration at the property boundary was calculated as follows:

$$Concentration\ at\ Boundary = \frac{(Q_1 C_1) + (Q_2 C_2)}{Q_1 + Q_2}$$

where:

Q_1: Vertical leachate derived groundwater flux entering the basal till overburden/shallow bedrock aquifer (L/day)

C_1: Parameter concentration in leachate derived groundwater (mg/L)

Q_2 Upgradient groundwater recharge/flux into deep basil till overburden/shallow bedrock aquifer (L/day)

C_2: Parameter concentration of upgradient recharge (mg/L)

The projected groundwater quality in the basal till overburden/shallow bedrock aquifer at the downgradient boundary of the Site is presented in **Table 6.3**.

A review of the results of the vertical migration simulation and the mass balance assessment of the horizontal migration within the basal till overburden/shallow bedrock aquifer indicates that concentrations leachate derived groundwater entering the aquifer will be reduced by an average factor of 4 prior to off-Site migration.

As shown in **Table 6.3**, groundwater quality is forecasted to be acceptable at the downgradient boundary with respect to the Site-specific RUC criteria and the ODWS (with the exception of benzene and vinyl chloride which are predicted to be at or below the laboratory reporting limits).

It is important to once again stress that the model utilized assumptions are very conservative for several reasons, including the following:

– A reduced native silty clay thickness has been included in the vertical model (5.6 m versus 9 m used in previous Site models). This assumes all landfill leakage will occur from the base of the landfill that will be excavated into the silty clay aquitard. This represents the shortest vertical travel time and least attenuation prior to reaching the basal till/shallow bedrock aquifer,
– Both the vertical and horizontal models include only dilution and dispersion (vertical model only). No additional attenuation factors such as chemical, and biological processes including, adsorption, biodegradation, cation and anion exchange, filtration, and precipitation have been incorporated into the mode. It is reasonable to assume that these processes would contribute additional attenuation not accounted for in the model.
– Peak or maximum concentrations reported in leachate over the past five years have been used to represent leachate generated at the Site,
– Where reported background concentrations were below the method detection limit, half of the MDL has been used to calculate the contaminant mass from upgradient flux while a value of 0.0 has been used to calculate the RUC, and finally
– Infiltration resulting from precipitation within the water table unit between the Landfill footprint and the western boundary of the Site, will contribute to the recharge of the deep basil till overburden/shallow bedrock aquifer, thus assisting in the further dilution of the leachate impacted groundwater prior to off-Site discharge. This has not been included as an additional attenuation mechanism.

Based on the modelling results obtained as part of the modelling exercises it is concluded that the proposed design of the Site will not result in any unacceptable degradation of the groundwater prior to off-Site migration.

7. Proposed Environmental Monitoring and Reporting Programs

Regular monitoring of the environment surrounding the landfill footprint is necessary to demonstrate that a landfilling site is performing as designed and the impacts on the environment are acceptable. Regular monitoring of the groundwater and surface water regimes allows for analysis of trends over time and ensures there is early warning of potential problems.

Based on the hydrogeologic setting of the Site and the proposed design of the landfill, the groundwater monitoring program needs to address groundwater quality in both the shallow water table unit and the deep basal till overburden/shallow bedrock aquifer. The deep basal till overburden/shallow bedrock aquifer is a primary receptor of concern as it has some potential to be utilized off-Site as a source of water supply. The current groundwater monitoring program developed for the Site is based on the requirements of O. Reg. 232/98, the landfilled waste, and the known leachate characteristics. As previously discussed, the Site's current environmental monitoring program is robust and sufficient to monitor water quality.

The proposed landfill footprint will expand approximately 30 m to the north. This will cover the current monitoring well nests MW1S/D-07 (located in the northwest) and OW9A/B-06 (located in the northeast). Prior to landfill construction each well nest will be suitably abandoned, via overdrilling, to ensure that the potential for contaminant migration is eliminated. In order to supplement the understanding of upgradient groundwater quality, GHD installed an additional two monitoring well nests on the northern Site boundary (MW13S/D-22 and MW14S/D-22). The approximate locations of MW13S/D-22 and MW14S/D-22 are illustrated on **Figure 3.1**.

The proposed long-term monitoring program for the Site in the context of the expansion is outlined in **Table 7.1**. This proposed monitoring program is equivalent to the current monitoring program undertaken at the Site, with the addition of the supplementary upgradient monitoring well nests installed in 2022 (MW13S/D-22 and MW14S/D-22). This monitoring program is largely consistent with the program outlined in the Site's current ECA. MW1S/D-07 and OW9A/B-06 will be removed from the program once construction on the proposed expansion begins.

Monitoring and operation progress reports will continue to be prepared for the Site and submitted to the District Office of the MECP prior to the March 31st deadline as outlined in the current ECA. Each annual report will include but not be limited to the details outlined in the current ECA (Section 12 (6) through (7)).

7.1 Trigger Level Monitoring Program and Contingency Response Plan

In 2015, GHD undertook a detailed review of the available database of groundwater and leachate quality data for the Site. The purpose of this review was to use this information to develop a Site-specific Trigger Level Program (TLP) and Contingency Response Plan (CRP). The TLP and CRP were included in the Updated D&O report which was submitted and approved in December 2018.

The purpose of the TLP is to provide timely identification of potential Site-related water quality impairment and in turn permit implementation of appropriate contingency measures to mitigate the potential for non-compliance.

Groundwater compliance at the Site is based on Site boundary groundwater quality and how it compares to Site-specific Reasonable Use Concept (RUC) criteria. The RUC criteria are calculated from generic ODWS and background concentrations. For the purposes of the TLP, 85 percent of the Site-specific RUC criteria are used as the trigger levels. Accordingly, the TLP is intended to provide advance warning of potential Site groundwater compliance issues.

The RUC criteria are re-calculated annually as groundwater quality data is added to the database. The RUC criteria used for this assessment were established using background water quality data collected from monitoring wells

located upgradient of the landfill. The RUC established for the shallow overburden unit is derived from background groundwater quality data gathered at MW1B-01/MW1B-07/MW1B-13, OW3B-85/OW3B-07/OW3B-13, and OW9B-92/OW9B-06. The RUC established for the basal till overburden/shallow bedrock unit were derived from background groundwater quality data gathered at MW1A-01/MW1A-07/MW1A-13, OW3A-85/OW3A-07/OW3A-13, and OW9A-06.

As illustrated on **Figure 3.1**, newly installed monitoring wells MW13S/D-22 and MW14S/D-22 are located on the upgradient side of the landfill. Water quality results from these wells will be incorporated into the RUC calculations for future monitoring events.

To be consistent with the existing TLP, the following parameters have been selected as trigger parameters for groundwater quality:

– General Chemistry: chloride
– Metals: boron, chromium, lead
– PAHs: naphthalene, phenanthrene, pyrene, benzo(a)pyrene
– VOCs: benzene, ethylbenzene, toluene

The TLP will continue to focus on monitoring locations located downgradient of the landfill footprint.

Shallow overburden wells will include locations along the western boundary of the Site (MW10B-18), the eastern portion of the Site (MW2B-07), and along the southern boundary of the Site (OW1B-06, OW8B-06, MW11B-19, and MW12B-19).

The basal overburden/shallow bedrock unit beneath the OLA is overlain by a clay aquitard of very low hydraulic conductivity, and thus the potential for water quality impact in this unit is minimal. The basal overburden/shallow bedrock monitoring wells will include monitors located in the southern portion of the Site (OW1A-06, OW8A-06, MW11A-19, MW12A-19), the eastern portion of the Site (MW2A-01), and the western property boundary (MW10A-18).

As stated above an approved CRP was submitted as part of the updated Design and Operation Report (GHD, 2018). This CRP will continue to be used following the expansion of the landfill footprint.

8. Summary and Conclusions

The Site is characterized by two relevant groundwater units (a water table unit and a confined basal till overburden/shallow bedrock aquifer) which are separated by a thick layer of stratified silty clay, silty clay till and varved clays which form an aquitard of very low hydraulic conductivity. The vertical hydraulic conductivity of the lower portions of the silty clay aquitard is estimated at $2x10^{-8}$ cm/s.

The Site has previously been designed to take advantage of the very low permeability of the on-Site soils to ensure appropriate protection of the groundwater at the Site. The proposed expansion to the north will continue to take advantage of this natural Site feature. As additional protection for the environment, the proposed landfill design includes a base constructed of a single composite liner design consisting of a 1.5 mm thick high-density polyethylene (HDPE) liner overlying a 750 mm thick engineered clayey liner. The landfill base configuration will provide for a minimum of 3 m and an average of 5.6 m of native clay between the underside of the engineered clayey liner and the top of the silty sand till/sand and gravel layer overlying the bedrock. Leachate produced within the landfill will be collected in a leachate collection system installed above the HDPE liner and will be removed from the landfill mound on a continuous basis and treated on-Site prior to discharge.

Based on the existing leachate and groundwater quality at the Site and the high level of protection provided by the engineered composite liner and the natural silty clay aquitard, no groundwater quality compliance issues are predicted to occur under the scenario of the proposed expansion.

The Site has robust environmental monitoring and trigger level programs which will continue following landfill expansion. In the event that water quality results suggest future non-compliance is a possibility, the Site contingency plan will be implemented. This contingency plan provides a suitable mechanism for ensuring appropriate mitigative measures are put in place to eliminate or offset potential off-Site adverse effects.

NOTES:

1. EXISTING GROUND CONTOURS AND TOPOGRAPHIC FEATURES SHOWN ARE BASED ON FIELD SURVEY DATA COMPLETED MARCH 24, 1992 BY HENDERSON, PADDON ENVIRONMENTAL INC.
2. EXISTING GROUND CONTOURS AND TOPOGRAPHIC FEATURES SHOWN WERE UPDATED AUGUST 2007 BY CONESTOGA-ROVERS AND ASSOCIATES AND MAY 9, 2012 BY GENIVAR.
3. SW4 LOCATED AT THE UPSTREAM END AT THE DOUBLE CULVERT BENEATH HWY No.3, APPROX. 550m EAST OF THE INTERSECTION OF BROOKS RD. AND HWY. No.3.
4. EXISTING GROUND CONTOURS AND TOPOGRAPHIC FEATURES SHOWN WERE UPDATED WITH AS-BUILT STAGES 2A, AND 2B/3A FINAL CONDITIONS RECEIVED FROM THIRD PARTY INDEPENDANT SURVEYOR MAR-5-2014. NORTH CLAY STOCKPILE SURVEY BY SPEIGHT, VAN NOSTRAND & GIBSON LTD. SURVEYED JULY-17-2013.
5. EXISTING WASTE CONTOURS UPDATED WITH JANUARY-28-2015 TOPOGRAPHIC SURVEY COMPLETED BY THIRD PARTY INDEPENDENT SURVEYOR.

Notes:

All units in meters above mean sea level (m AMSL)
mBTOR Metres Below Top Of Riser

(1) Surveyed on February 18, 2005
(2) Surveyed on May 1, 2001
(3) Surveyed on January 9, 2007
(4) Surveyed on June 13, 2007
(5) Surveyed on July 26, 2007
(6) Surveyed on March 31, 2010
(7) Surveyed on July 17, 2013
(8) Water level not considered reliable, monitoring well replaced
(9) Water level elevation obtained from others and considered unreliable
(10) Surveyed in February 2020
(11) Leachate well also measured by BRE on December 12, 2017
(12) Monitoring Wells MW5A-09 and MW5B-09 were accessed and measured on December 27, 2017
(13) surveyed on July 26, 2018
(14) surveyed on December 17, 2019
(15) risers adjusted in August 2019
NM Not Measured
NS Not Surveyed
- Data Note Available

									Average: 4			

Notes:
(1) Average median background concentrations are based on groundwater quality reported at wells MW1S-13, OW3A-13, and OW9A-06 between 2017 and 2021.
(2) Maximum reported concentrations in leachate from 2017 and 2021 are used.
(3) Taken from the vertical model
(4) Where a parameter was analyzed for but was not detected at or above the Method Detection Limit, a value of 1/2 of the lowest MDL was assumed.
(5) Ontario Drinking Water Standards (ODWS), June 2003; revised June 2006, as amended, prepared by the MECP. Where no ODWS criteria exists, the RUC values were developed using Table 2 of the Soil, Groundwater and Sediment Standards for Use Under Part XV.I of the Environmental Protection Act, dated April 15, 2011.
(6) A value of zero was used to calculate the RUC for PAHs and VOCs.
RUC Reasonable Use Criteria
Bold Concentration exceeds ODWS and RUC.

Existing Environmental Compliance Approvals

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL
NUMBER 7323-C6EJUM
Issue Date: September 24, 2021

2270386 Ontario Limited
162 Cumberland Street
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd North, Cayuga, Haldimand County, Ontario.

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act , R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

- one (1) landfill site, having a capacity of 1,045,065 cubic metres (including waste and daily cover), a maximum fill rate of 250,000 tonnes per year and 1,000 tonnes per day;
- one (1) leachate treatment system, having a rated capacity of 200 cubic metres per day, complete with a leachate collection sump, a raw leachate primary settling tank, an aeration system and above-grade treated effluent storage tanks;

all in accordance with the supporting information listed in Schedule A.

For the purpose of this environmental compliance approval, the following definitions apply:

1. "Acoustic Assessment Report" means the report, prepared in accordance with Publication NPC-233 submitted in support of the application, that documents all sources of noise emissions and Noise Control Measures present at the Facility. "Acoustic Assessment Report" also means the Acoustic Assessment Report prepared by GHD, dated September 7, 2021 and signed by Michael Masschaele;
2. "Approval" means this Environmental Compliance Approval, including the application and supporting documentation listed above;
3. "Company" means 2270386 Ontario Limited, that is responsible for the construction or operation of the Facility and includes any successors and assigns;
4. "District Manager" means the District Manager of the appropriate local district office of the Ministry, where the Facility is geographically located;

5. "EPA" means the Environmental Protection Act, R.S.O. 1990, c.E.19, as amended;
6. "Equipment" means all the equipment, described in the Company's application, this Approval and in the supporting documentation submitted with the application, to the extent approved by this Approval;
7. "ESDM report" means the Emission Summary and Dispersion Modelling Report which was prepared in accordance with section 26 of O. Reg. 419/05 and the Procedure Document by GHD and dated June 11, 2021, submitted in support of the application, and includes any changes to the report made up to the date of issuance of this Approval;
8. "Facility" means the entire operation located on the property where the Equipment is located;
9. "Manual" means a document or a set of documents that provide written instructions to staff of the Company;
10. "Ministry" means the ministry of the government of Ontario responsible for the EPA and includes all officials, employees or other persons acting on its behalf;
11. "Noise Control Measures" means measures to reduce the noise emissions from the Facility and/or Equipment including, but not limited to, silencers, acoustic louvres, enclosures, absorptive treatment, plenums and barriers;
12. "Noise Guidelines for Landfill Sites" means the Ministry draft publication "Noise Guidelines for Landfill Sites", October 1998, as amended;
13. "Odour Management Plan" means the Odour Management Plan, Brooks Road Landfill Site, Haldimand County, prepared by GHD, dated June 11, 2021 that includes mitigation measures to minimize off-Site odour impacts, and if appropriate, a trigger mechanism and contingency plan;
14. "Publication NPC-233" means the Ministry Publication NPC-233, "Information to be Submitted for Approval of Stationary Sources of Sound", October, 1995;
15. "Publication NPC-300" means the Ministry Publication NPC-300, “Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning, Publication NPC-300”, August 2013, as amended;
16. “Site" means the entire waste disposal site, including the buffer lands, at the Brooks Road Landfill Site, Lot 24, Concession 1 North, Haldimand County; and
17. "Truck(s)" means trucks carrying waste for disposal at the Facility.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. **OPERATION AND MAINTENANCE**
    1. The Company shall prepare, not later than three (3) months from the date of this Approval, implement and continue to update as necessary, a Manual outlining the operating procedures and maintenance programs for the Equipment/Facility, which shall specify as a minimum:
        a. routine operating and maintenance procedures in accordance with good engineering practices;
        b. emergency procedures;
        c. frequency of inspections and scheduled preventative maintenance;
        d. procedures to prevent upset conditions;
        e. all appropriate measures to prevent/minimize fugitive particulate matter, noise and odorous emissions from all potential sources at the Site; and
        f. procedures for record keeping activities relating to the operation and maintenance programs.
    2. The Company shall ensure that the Facility/Equipment is properly operated and maintained at all times and in accordance with this Approval, the operating procedures and maintenance Manual, and the Odour Management Plan.
2. **ODOUR MANAGEMENT PLAN**
    1. The Company shall forthwith implement the Odour Management Plan and continue to review and update as necessary and in consultation with the District Manager as applicable.
    2. If there is any odour complaint, or significant odour is detected during daily inspection, and the odour is confirmed to originate from the Site, mitigation measures shall be implemented immediately in accordance with the Odour Management Plan.
    3. If odour causes adverse off-site impacts that are not mitigated through implementation of odour mitigation measures according to the Odour Management Plan, the Company shall, upon written notification from the District Manager, conduct an investigation into the cause as to why the impacts were not mitigated and submit to the District Manager within the time frame identified in the notice, an assessment of the issues and the need for implementation of contingency actions in accordance with the Odour Management Plan.
    4. If the Ministry deems the odour mitigation measures taken as per Condition

2.3 to be unsuitable, insufficient or ineffective, the District Manager may direct the Company, in writing, to propose further measures to address the noted failure, upset or malfunction, which may include requiring a reduction in the receipt of waste, cessation of the receipt of waste, removal and disposal of waste from the waste diversion area, the removal of leachate from the Site as well as, making repairs or modifications to equipment or processes. Such measures shall be implemented by the Company upon approval by the District Manager.

5. If the cessation of the receipt of waste is required, as determined by Condition 2.4, no waste shall be received at the Site until the District Manager is satisfied that odour impacts have been adequately mitigated.
6. The Company shall prepare and maintain an annual summary of the actions taken and achievements made under the Odour Management Plan as of December 31 of the previous calendar year.

3. **NOISE**
    1. The Company shall, at all times, ensure that the noise emissions from the Facility comply with the limits set out in Ministry Publication NPC-300.
    2. The Company shall, at all times, ensure that the noise emissions from the landfill site operations at the Facility comply with the limits set out in Ministry draft publication "Noise Guidelines for Landfill Sites".
    3. The Company shall ensure that the operating times and numbers of Equipment are limited as detailed in Section 2 of the Acoustic Assessment Report.
    4. The Company shall limit Truck arrivals and departures to a maximum of sixteen (16) trucks per sixty (60) minute period, restricted to the daytime hours from 7 a.m. to 7 p.m.

4. **COMPLAINTS RESPONSE PROCEDURE**
    1. The Company shall develop in consultation with the District Manager, not later than three (3) months from the date of this Approval, implement and continue to update as necessary, a Complaint Response Protocol for dealing with and responding to environmental complaints as a result of operation of the Equipment/Facility approved by this Approval. The Complaint Response Protocol shall include:
        a. procedures for recording the complaint;
        b. procedures for investigating the complaint, including determining all possible causes of the complaint, and the necessary actions to appropriately deal with the cause of the subject matter of the complaint;

c. procedures for taking the necessary actions to appropriately deal with the cause of the subject matter of the complaint in a timely and effective manner;

d. a description of any measures taken to address the complaint, outcome of the actions taken and steps to be taken to avoid the recurrence of similar incidents;

e. procedures for record keeping of activities relating to the complaints;

f. procedures for notifying the District Manager of the complaint in a manner acceptable to the District Manager; and

g. procedures for replying to the complainant.

5. **RECORD RETENTION**
    1. Any information requested by any employee in or agent of the Ministry concerning the Facility and its operation under this Approval, including, but not limited to, any records required to be kept by this Approval, shall be provided to the employee in or agent of the Ministry, upon request, in a timely manner. Unless otherwise specified in this Approval, the Company shall retain, for a minimum of five (5) years from the date of their creation all reports, records and information described in this Approval, including,
        a. a copy of the ESDM Report;
        b. a copy of the Odour Management Plan and activities pertaining to the implementation of the Odour Management Plan;
        c. a copy of the Acoustic Assessment Report;
        d. records of maintenance, repair and inspection of Equipment/Facility;
        e. all records of any upset conditions associated with the operation of the Equipment/Facility;
        f. all records on the environmental complaints, as required under condition 4.

SCHEDULE A

Supporting Documentation

1. Environmental Compliance Approval Application and all supporting information, dated June 1, 2021, signed by Richard Weldon and submitted by the Company;
2. Emission Summary and Dispersion Modelling Report, dated June 11, 2021 and prepared by GHD;

3. Odour Management Plan, dated June 11, 2021 and prepared by GHD;
4. Acoustic Assessment Report prepared by GHD, dated September 7, 2021 and signed by Michael Masschaele; and the additional information provided by Sam East of GHD in the email dated September 7, 2021 and Daniel Turner of GHD in the email dated September 10, 2021.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition No. 1 is included to emphasize that the Equipment/Facility must be maintained and operated according to a procedure that will result in compliance with the EPA, the Regulations and this Approval.
2. Condition No. 2 is included to ensure that the Equipment/Facility is operated in a manner that does not result in unacceptable odour emissions and mitigation measures are employed in event of an odour impact.
3. Condition No. 3 is included to provide the minimum performance requirements considered necessary to prevent an adverse effect resulting from the operation of the Equipment/Facility.
4. Condition Nos. 4 and 5 are included to require the Company to keep records and to provide information to the Ministry so that compliance with the EPA, the regulations and this Approval can be verified.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 8922-9ZHR29 issued on October 8, 2015.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment, Conservation and Parks
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 326-5370 or** www.ert.gov.on.ca

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 24th day of September, 2021

Neryed Ragbar, P.Eng.
Director
appointed for the purposes of Part II.1 of the *Environmental Protection Act*

QN/
c: District Manager, MECP Hamilton - District
Daniel Turner, GHD

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL

NUMBER 1122-BKUPSM
Issue Date: February 3, 2020

2270386 Ontario Limited
162 Cumberland St
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd, Lot 24, Concession 1 North of Talbot Road
County of Haldimand

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act, R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

A stormwater management facility and a leachate collection, treatment, and disposal system to service the Brooks Road Landfill Site (formerly Edwards Landfill Site), located in Part of Lot 24, Concession 1, North of Talbot Road, Haldimand County, discharging to a roadside ditch along the east side of Brooks Road, consisting of the following:

Leachate Treatment System

A leachate treatment system designed and installed for a Rated Capacity of 200 m³/day to service the Brooks Landfill Site, located at the south-central side of the landfill site, with an effluent discharge system to discharge effluent to a roadside ditch along Brooks Road with a Rated Capacity of 45 m^3 /day, with a Peak Daily Flow of 60 m^3/day and such other removal of effluent from the Landfill Site in compliance with law, including Ontario Regulation 347, and consisting of the following:

- One (1) leachate collection sump located in the south-east corner of Stage One part of the landfill, equipped with one (1) 6.3 L/sec at 14 m TDH pump discharging through one (1) approximately 35 m long 76.2 mm diameter forcemain into the primary settling tank described below.

- One (1) 28 m³ **Primary Settling Tank** receiving leachate from the existing leachate collection sump, equipped with baffle walls and one (1) 7 L/sec at 9.0 m TDH PST pump, three (3) level floats, and pH monitor, discharging through one (1) 500 micron opening strainer installed on the

feed line to an aeration system described below.

- One (1) **Aeration System** comprising of two (2) 114 m³ capacity concrete tanks in series each aeration tank equipped with 1" lateral air diffusers, two (2) air blowers each with 910 m³/hr (530 cfm) capacity at 13 psi head loss, and the second aeration tank fitted with three (3) level floats, discharging via one (1) 66 m³/hr capacity at 106 m TDH feed pump to the Membrane Biofiltration Reactor (MBR) treatment system described below.

- One (1) 200 m³/day Rated Capacity **Membrane Biofiltration Reactor (MBR) Treatment System** consisting 8 mm diameter membranes housed in four (4) 200 mm diameter tubular modules installed in series and providing a filtration surface area of 36.7 m² per module, designed to operate at maximum pressure of 8 Bar (116 psi) at 40º C with a circulation velocity of 3 m/sec, providing a total filtration area of 146.8 m², equipped with one (1) 200 m³/hr capacity MBR recirculation pump to be used to recirculate activated sludge across the membranes, discharging to a UV disinfection system described below.

- Two (2) **UV Disinfection Units** operating in parallel, each unit capable of providing minimum UV dosage of 40 mJ/cm² at a flow of 114 L/min, discharging by gravity to an effluent transfer tank described below.

- Effluent discharge system consisting of:
  - One (1) 12.5 m³ capacity **Effluent Transfer Tank** equipped with one (1) 7 L/sec at 11 m TDH capacity effluent pump and three (3) level floats, to be used as temporary storage tank to transfer effluent to the existing effluent discharge holding tanks described below.
  - Three (3) 150 m³ capacity **Effluent Discharge Holding Tanks.**
  - Discharge piping from the **Effluent Discharge Holding Tanks** and flow measuring device for a Rated Capacity of 45 m^3/day with a Peak Daily Flow of 60 m^3/day, discharging to the roadside ditch.
  - Discharge piping from the **Effluent Discharge Holding Tanks** and control valve for loading of haulage units for lawful removal of effluent from the Site

- One (1) 12.5 m³ capacity **Sludge Storage Tank**, providing approximately eight (8) days sludge storage capacity, equipped with one (1) 7 L/sec at 7 m TDH capacity sludge pump transferring sludge to the landfill for disposal.

- A chemical feed system consisting of:

  Nitrification
  - one (1) 9 L/hr at 44 psi capacity chemical metering pump dosing **magnesium hydroxide** from a dual wall storage tank to the aeration tank described above for alkalinity control.

  Phosphorus Removal
  - one (1) 9 L/hr at 44 psi capacity chemical metering pump dosing **alum** into the feed line of the aeration tank described above for phosphorus removal.

  Acid Cleaning

- one (1) 24 L/hr at 145 psi capacity chemical metering pump dosing **citric acid** into the MBR feed piping during an acid cleaning of the membranes to remove calcified minerals.

Oxidation Cleaning
- one (1) 78 L/hr at 145 psi capacity chemical metering pump dosing **sodium hypochlorite** into the MBR feed piping during a chlorine cleaning of the membranes to remove accumulated sludge.

Alkaline Cleaning
- one (1) 24 L/hr at 145 psi capacity chemical metering pump dosing **magnesium hydroxide** into the MBR feed piping during an alkaline cleaning of the membranes to remove accumulated fats, oil, and grease.

Leachate Collection System

- a leachate collection, transmission, and storage, designed to handle a maximum of 60 m³/day of leachate generated from the site, consisting of two (2) 75.7 L/min capacity leachate pumps and one (1) 50 mm diameter HDPE forcemain.

Stormwater Management System

A stormwater management facility to service the Brooks Road Landfill Site with a total drainage area of 14.91 ha and an approved landfill footprint of 6.07 ha, designed to provide quantity and quality control of stormwater runoff from storm events with up to 1:100 year return frequency, consisting of the following:

Stormwater Management System (SWMS)

A stormwater management system to provide quality and quantity control of stormwater runoff from the site during the active operation and post closure of the landfill site, consisting of the following:

- one (1) perimeter ditch running from the north-east corner of the landfill site along the east side and south side of the landfill foot print, having a 0.3 m bottom width, a minimum of 1.0 m depth, and 3H:1V side slopes on the road side, conveying collected stormwater runoff to a stormwater management pond described below.

- one (1) perimeter ditch running from the north-east corner of the landfill site along the north side and west side of the landfill foot print, having a 0.3 m bottom width, a minimum of 1.0 m depth, and 3H:1V side slopes on the road side, conveying collected stormwater runoff to a stormwater management pond described below.

- one (1) inlet structure including two (2) 600 mm diameter concrete culverts and an open swale covered with turf reinforcement mat discharging into a forebay described below.

- one (1) forebay with approximate length of 29 m, upstream width of 4 m and downstream width of 15 m, a permanent pool depth of 0.60 m, and side slopes of 4H:1V, equipped with a berm with top

elevation 197.85 m AMSL, discharging to a stormwater management pond described below.

- one (1) wet detention stormwater management pond **(SWMS Pond)** to be located on south west corner of the site providing a total storage capacity of 6,768 m³ consisting of a permanent pool storage volume of 1,266 m³ (at elevation 197.85 m AMSL) with a maximum depth of 0.60 m and an extended storage volume of 5,502 m³ with an extended storage depth of 0.34 m (at elevation of 198.19 m AMSL).

- one (1) outlet structure consisting of one (1) 150 mm diameter perforated PVC pipe with an invert elevation of 197.85 m AMSL, equipped with 75 mm orifice plate, an outlet control valve, and one (1) 600 mm x 1200 mm concrete catch basin, discharging to a roadside ditch along the east side of Brooks Road.

- one (1) emergency by-pass structure consisting of a 2.0 meter wide rip-rap spillway at invert elevation of 199.10 m AMSL discharging to a roadside ditch along Brooks Road,

Including all controls and associated appurtenances,

all in accordance with the submitted supporting documents listed in Schedule A.

For the purpose of this environmental compliance approval, the following definitions apply:

"Approval" means this entire document and any schedules attached to it, and the application;

"BOD5" (also known as TBOD5) means five day biochemical oxygen demand measured in an unfiltered sample and includes carbonaceous and nitrogenous oxygen demand;

"CBOD5" means 5 day carbonaceous (nitrification inhibited) biochemical oxygen demand measured in unfiltered sample;

"Daily Concentration" means the concentration of a contaminant in the effluent discharged over any single day, as measured by a composite or grab sample, whichever is required;

"Director" means a person appointed by the Minister pursuant to section 5 of the EPA for purposes of Part II.1, EPA;

"District Manager" means the District Manager of the Hamilton District Office;

"EPA" means the Environmental Protection Act, R.S.O. 1990, c.E.19, as amended;

"Equivalent Equipment" means a substituted equipment or like-for-like equipment that meets the required quality and performance standards of a named equipment;

"Limited Operational Flexibility" (LOF) means any modifications that the Owner is permitted to make to the Works under this Approval;

"Ministry" means the ministry of the government of Ontario responsible for the EPA and OWRA and includes all officials, employees or other persons acting on its behalf;

"Monthly Average Concentration" means the arithmetic mean of all Daily Concentrations of a contaminant in the effluent sampled or measured, or both, during a calendar month;

"Monthly Average Daily Flow" means the cumulative total sewage flow to the sewage works during a calendar month divided by the number of days during which sewage was flowing to the sewage works that month;

"Notice of Modifications" means the form entitled "Notice of Modifications to Sewage Works";

"Owner" means 2270386 Ontario Limited and its successors and assignees;

"OWRA" means the Ontario Water Resources Act, R.S.O. 1990, c. O.40, as amended;

"Previous Works" means those portions of the sewage works previously constructed and approved under an Approval;

"Proposed Works" means the sewage works described in the Owner's application, this Approval, to the extent approved by this Approval;

"Rated Capacity" means the Monthly Average Daily Flow for which the Works are approved to handle;

"Works" means the sewage works described in the Owner's application, and this Approval, and includes Proposed Works, Previous Works, and modifications made under Limited Operational Flexibility.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

I. GENERAL

1. GENERAL CONDITION

(1) The Owner shall ensure that any person authorized to carry out work on or operate any aspect of the Works is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.

(2) Except as otherwise provided by these conditions, the Owner shall design, build, install, operate and maintain the Works in accordance with the description given in this Approval, and the application for approval of the Works.

(3) Where there is a conflict between a provision of any document in the schedule referred to in this Approval and the conditions of this Approval, the Conditions in this Approval shall take precedence, and where there is a conflict between the documents in the schedule, the document bearing the most recent date shall prevail.

(4) Where there is a conflict between the documents listed in the Schedule submitted documents, and the application, the application shall take precedence unless it is clear that the purpose of the document was to amend the application.

(5) The Conditions of this Approval are severable. If any Condition of this Approval, or the application of any requirement of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

2. CHANGE OF OWNER

(1) The Owner shall notify the District Manager and the Director, in writing, of any of the following changes within thirty (30) days of the change occurring:

(a) change of Owner or operating authority, or both.

(b) change of address of Owner or operating authority or address of new owner or operating authority.

(c) change of partners where the Owner or operating authority is or at any time becomes a partnership, and a copy of the most recent declaration filed under the Partnerships Registration Act.

(d) change of name of the corporation where the Owner or operator is or at any time becomes a corporation, and a copy of the most current "Initial Notice or Notice of Change" (Form 1, 2 or 3 of O. Reg. 189, R.R.O. 1980, as amended from time to time), filed under the Corporations Information Act shall be included in the notification to the District Manager.

(2) In the event of any change in ownership of the works, the Owner shall notify in writing the succeeding owner of the existence of this Approval, and a copy of such notice shall be forwarded to the District Manager.

(3) The Owner shall ensure that all communications made pursuant to this Condition will refer to this Approval's number.

II. LEACHATE COLLECTION AND TREATMENT FACILITY

3. LEACHATE MANAGEMENT

(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site leachate treatment system

(a) Notwithstanding Condition 3(1), leachate generated at the landfill Site that is not treated using the on-site leachate treatment system shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.

(b) In the event there is effluent from leachate that has been treated in the on-site leachate treatment system that cannot be disposed of to the roadside ditch, such effluent may be disposed of to an off-site facility provided such disposal is completed lawfully, including pursuant to Ontario Regulation 347.

(2) Leachate generated at the Landfill Site that is not treated using the on-site leachate treatment system shall not be discharged to the natural environment at any time.

4. OPERATIONS AND MAINTENANCE

(1) Within six (6) months of the issuance date of this Approval, the Owner shall prepare and submit for approval to the Director and a copy to the District Manager a "Contingency and Remedial Action Plan for the Works (**On-site leachate treatment system**)" which shall provide detailed action plans that will be implemented during any event when the effluent limits set under Condition 6(1) are not met;

(2) The Owner shall prepare an operations manual prior to the commencement of operation of the sewage works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the works.

(b) inspection programs, including frequency of inspection, for the works and the methods or tests employed to detect when maintenance is necessary.

(c) repair and maintenance programs, including the frequency of repair and maintenance for the works.

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager, and

(e) complaint procedures for receiving and responding to public complaints.

(3) The Owner shall maintain the operations manual up to date through revisions undertaken from time to time and retain a copy at the location of the sewage works. Upon request, the Owner shall make the manual available for inspection and copying by Ministry personnel.

5. EFFLUENT OBJECTIVES

(1) The Owner shall use best efforts to design, construct and operate the works with the objective that the concentrations of the materials named below as effluent parameters are not exceeded in the effluent from the Works.

Table 1 - Effluent Objectives	
Effluent Parameter	**Concentration Objective** (milligrams per litre unless otherwise indicated)
CBOD5	5.0
Total Suspended Solids (TSS)	5.0
Total Ammonia Nitrogen (TAN)	1.0
Total Phosphorus (TP)	0.2
Zinc	0.03
Phenols	0.005
Ethylbenzene	0.008

(2) As a further effluent objective, the Owner shall use best efforts to maintain the pH of the effluent from the works within the range of 6.5 to 8.5, inclusive, at all times.

(3) The Owner shall include in all reports submitted in accordance with Condition 12 a summary of the efforts made and results achieved under this Condition.

6. EFFLUENT LIMITS

(1) The Owner shall design, construct and operate the works such that the concentrations of the materials named below as effluent parameters are not exceeded in the effluent from the works.

Table 2 - Effluent Limits	
Effluent Parameter	**Concentration Limit** (milligrams per litre unless otherwise indicated)
Column 1	Column 2
CBOD5	10.0
Total Suspended Solids (TSS)	10.0
Total Ammonia as Nitrogen (TAN)	3.0
Total Phosphorus (TP)	0.29
Toxicity (Daphnia magna)	Non-acutely lethal
Toxicity (Rainbow Trout)	Non-acutely lethal
pH of the effluent maintained between 6.0 to 9.5, inclusive, at all times	

(2) The Owner shall ensure that monitoring results for effluent discharge parameters outlined in Condition 9(3) meet the concentration limits set out in Column 2 of subsection (1).

(3) For the purposes of determining compliance with and enforcing subsection (1):

(a) The Concentration of a parameter named in Column 1 of subsection (1), sampled in accordance with Condition 9(3) shall not exceed the corresponding maximum concentration set out in Column 2 of subsection (1).

(b) The pH of the effluent shall be maintained within the limits outlined in subsection (1), at all times.

(4) In the event of any instance of non-compliance with the effluent limits stipulated under Condition 6(1), the Owner shall implement the "Contingency and Remedial Action Plan for the Works (**On-site leachate treatment system**)" prepared under Condition 3(1), and shall determine appropriate control measures to achieve effluent limits and the time lines for the implementation of identified control measures. The Owner shall submit the proposed control measures and implementation time lines for approval to the Director and a copy to the District Manager.

(5) If compliance with effluent limits are not met within the time lines approved under Condition 6(4), the Owner shall discontinue effluent discharge from the Works and implement off-site disposal of leachate for proper treatment.

(6) In the event that any of the control measures proposed under Condition 6(4) require the installation or an upgrade of the Works, the Owner shall submit an application to the Director for an amendment of this Approval.

7. EFFLUENT - VISUAL OBSERVATIONS

(1) Notwithstanding any other condition in this Approval, the Owner shall ensure that the effluent from the works is essentially free of floating and settleable solids and does not contain oil or any other substance in amounts sufficient to create a visible film, sheen or foam on the receiving waters.

8. SPECIAL CONDITION

(1) The Owner shall operate the roadside ditch discharge system for the On-Site Leachate Treatment System at the approved Rated Capacity of 45 m^3/day and Peak Daily Flow of 60 m^3/day until an approval is issued by the Director to operate the roadside ditch discharge system at a higher rated capacity. To obtain approval for using the roadside ditch discharge system at a higher rated capacity, the Owner shall complete a detailed receiving surface water assimilative capacity study and submit the study report along with a proposal for effluent limits to the Ministry's Regional Technical Support Section for review and recommendation. Upon receiving review comments and recommendation of the effluent limits from the Technical Support Section, the Owner shall submit to the Director an application for amendment of this Approval and a detailed design brief for approval of the higher rated capacity for the roadside ditch discharge system.

9. EFFLUENT MONITORING AND RECORDING

The Owner shall, upon commencement of operation of the sewage works, carry out the following monitoring program:

(1) All samples and measurements taken for the purposes of this Approval are to be taken at a time and in a location characteristic of the quality and quantity of the effluent stream over the time period being monitored.

(2) Leachate grab samples shall be collected and analyzed at the following sampling point and at the sampling frequencies specified for each parameter listed:

Table 3 - Influent Leachate Monitoring
Sampling Point: Leachate Storage Tank

Parameters	Frequency	Parameter	Frequency
CBOD5	Monthly	Chlorides	Quarterly
Total Suspended Solids (TSS)	Monthly	Nitrate as Nitrogen	Quarterly
Total Ammonia as Nitrogen (TAN)	Monthly	Arsenic	Quarterly
Total Phosphorus (TP)	Monthly	Barium	Quarterly
pH	Monthly	Boron	Quarterly
Zinc	Monthly	Chromium	Quarterly
Phenols	Monthly	Copper	Quarterly
Ethylbenzene	Monthly	Iron	Quarterly
		Lead	Quarterly
		Benzo(a)pyrene	Quarterly
		Naphtalene	Quarterly
		Benzene	Quarterly
		Toluene	Quarterly

(3) Effluent samples shall be collected and analyzed at the following sampling point, at the sampling frequencies and using the sample type specified for each parameter listed:

Table 4 - Effluent Monitoring
Sampling Point: Effluent Discharge Pipe
Discharge to Brooks Road Ditch

Parameters	Sample Type	Frequency
CBOD5	Grab	Monthly
Total Suspended Solids (TSS)	Grab	Monthly
Total Ammonia as Nitrogen (TAN)	Grab	Monthly
Total Phosphorus (TP)	Grab	Monthly
pH	Grab	Monthly
Zinc	Grab	Monthly
Phenols	Grab	Monthly
Ethylbenzene	Grab	Monthly
Chlorides	Grab	Quarterly
Nitrate as Nitrogen	Grab	Quarterly
Arsenic	Grab	Quarterly
Barium	Grab	Quarterly
Boron	Grab	Quarterly
Chromium	Grab	Quarterly
Copper	Grab	Quarterly
Iron	Grab	Quarterly
Lead	Grab	Quarterly
Benzo(a)pyrene	Grab	Quarterly
Naphtalene	Grab	Quarterly
Benzene	Grab	Quarterly
Toluene	Grab	Quarterly
Acute Lethality Test (Rainbow Trout and Daphnia magna)	Grab	Quarterly

(4) The methods and protocols for sampling, analysis, toxicity testing, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater Version 2.0" (January 2016), PIBS 2724e02, as amended from time to time by more recently published editions.
(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions, and
(c) the Environment Canada publications "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Rainbow Trout" (EPS 1/RM/13 Second Edition - December 2000)

and "Biological Test Method: Reference Method for Determining Acute Lethality of Effluents to Daphnia magna" (EPS 1/RM/14 Second Edition - December 2000), as amended from time to time by more recently published editions.

(5) The measurement frequencies specified in subsections (2) and (3) in respect of any parameter are minimum requirements which may, after one (1) year of monitoring in accordance with this Condition, be modified by the District Manager in writing from time to time.

(6) The owner shall install and maintain (a) continuous flow measuring device(s) to measure the flow rate of the effluent discharged from the sewage works, with an accuracy to within plus or minus fifteen (15) per cent of the actual flow rate for the entire design range of the flow measuring device and record the flow rate at a daily frequency..

(7) The Owner shall retain for a minimum of five (5) years from the date of their creation, all records and information related to or resulting from the monitoring activities required by this Approval.

III - STORMWATER MANAGEMENT FACILITY

10. MONITORING AND RECORDING

(1) The Owner shall, upon commencement of operation of the Works, carry out the following stormwater monitoring program. Stormwater grab samples shall be collected from the Stormwater Management System **(SWMS) Pond** at a **quarterly frequency** (Spring, Summer, Fall, and Winter) and analysed for the following parameters:

Table 5 - Stormwater Monitoring
Sampling Point: **SWMS Pond**

General Parameters	Metals	Field Parameters
Alkalinity	Arsenic	Conductivity
Conductivity	Barium	Dissolved Oxygen
Hardness	Boron	pH
pH	Cadmium	Temperature
Chloride	Chromium	
Sulphate	Copper	
Nitrate as Nitrogen	Iron	
Nitrite as Nitrogen	Lead	
Total Ammonia as Nitrogen (TAN)	Mercury	
Total Suspended Solids	Zinc	
Total Dissolved Solids		
Chemical Oxygen Demand	**Organics**	
Total Phosphorus	Benzo(a)pyrene	
Total Kjeldahl Nitrogen	Ethylbenzene	
Biological Oxygen Demand (BOD5)	Naphthalene	
Phenols		

(2) The methods and protocols for sampling, analysis, toxicity testing, and recording shall conform, in order of precedence, to the methods and protocols specified in the following:

(a) the Ministry's publication "Protocol for the Sampling and Analysis of Industrial/Municipal Wastewater Version 2.0" (January 2016), PIBS 2724e02, as amended from time to time by more recently published editions;

(b) the publication "Standard Methods for the Examination of Water and Wastewater" (21st edition) as amended from time to time by more recently published editions.

11. OPERATION AND MAINTENANCE

(1) The stormwater run-off generated from the active waste fill area shall be considered contaminated and treated as leachate. The Owner shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system.

(2) The Owner shall exercise due diligence in ensuring that, at all times, the Works and the related equipment and appurtenances used to achieve compliance with this Approval are properly operated and maintained. Proper operation and maintenance shall include effective performance, adequate funding, adequate operator staffing and training, adequate laboratory facilities, process controls and alarms and the use of process chemicals and other substances used in the Works.

(3) The Owner shall prepare an operations manual within six (6) months of Substantial Completion of the Works, that includes, but not necessarily limited to, the following information:

(a) operating procedures for routine operation of the Works.

(b) inspection programs, including frequency of inspection, for the Works and the methods or tests employed to detect when maintenance is necessary for operational efficiency and environmental protection of the receiving body.

(c) repair and maintenance programs, including the frequency of repair and maintenance for the Works.

(d) contingency plans and procedures for dealing with potential spill, bypasses and any other abnormal situations and for notifying the District Manager, and

(e) complaint procedures for receiving and responding to public complaints.

(4) The Owner shall maintain the operations manual current and retain a copy at the location of the Works or operational office of the Owner for the operational life of the Works. Upon request, the Owner shall make the manual available to Ministry staff.

(5) The Owner shall undertake an inspection of the condition of the stormwater management ponds and ditches, at least once a year, and undertake any necessary cleaning and maintenance to prevent the

excessive build-up of sediment and/or decaying vegetation.

(6) The Owner shall undertake an inspection and necessary maintenance of the SWMS pond and associated erosion controls including temporary berms, silt fences, rocks and straw bale check dams at least once a year to ensure that the Works are effectively protecting the environment.

(7) The Owner shall maintain a logbook to record the results of the stormwater management pond inspections and any cleaning and maintenance operations undertaken and shall keep the logbook at the site or operational office of the Owner for inspection by the Ministry.

Stormwater Management System (SWMS)

(8) Before the commencement of operation of the Works, the Owner shall prepare a "Stormwater Contingency and Remedial Action Plan" for the Works and provide a copy to the District Manager.

(9) The Owner shall operate the Works in a **normally open position**. The Owner shall compare monitoring results obtained from the Works under Condition 10(1) with the trigger levels of the selected trigger parameters listed in Table 7 to identify any potential leachate impact to stormwater discharged from the ponds.

Table 7 - Trigger Parameters

Parameter	Trigger Level (mg/L)
Un-ionized Ammonia	0.02
Arsenic	0.005
Boron	1.5
pH (unitless)	6.5 to 8.5

(10) In the event that a monitoring result for any of the parameters listed in Table 7 exceeds its corresponding trigger level concentration, the Owner shall re-sample within two weeks period to confirm the trigger level concentration exceedance for that parameter.

(11) In the event that the trigger level concentration exceedance of any parameter of concern is not confirmed after the second round of sampling conducted under Condition 11(10), then, normal stormwater monitoring shall be resumed.

(12) In the event that the trigger level concentration exceedance of any parameter of concern is confirmed after the second round of sampling conducted under Condition 11(10), the Owner shall operate the Works in a **normally closed position** and notify the District Manager forthwith.

(13) While operating the Works in a **normally closed position**, the Owner shall implement the "Stormwater Contingency and Remedial Action Plan" prepared under Condition 11(8) and collect a grab sample and analyze for the trigger parameters listed under Condition 11(9) at a **weekly frequency** preferably after a rainfall event.

(14) The Owner shall resume operating the Works in a **normally open position** if monitoring results for all

trigger parameters from three (3) consecutive sampling events conducted under Condition 11(13) are less than their respective trigger level concentrations.

(15) Discharge of contaminated stormwater from the Works to storm sewer/surface water is prohibited, except where it is necessary to avoid loss of life, personal injury, danger to public health or severe property damage.

IV - GENERAL

12. REPORTING

(1) One week prior to the start up of the operation of the works, the Owner shall notify the District Manager (in writing) of the pending start up date.

(2) The Owner shall report to the District Manager or designate, any exceedance of any parameter specified in Condition 6 orally, as soon as reasonably possible, and in writing within seven (7) days of the exceedance.

(3) In addition to the obligations under Part X of the Environmental Protection Act, the Owner shall, within ten (10) working days of the occurrence of any reportable spill as defined on Ontario Regulation 675/98, bypass or loss of any product, by-product, intermediate product, oil, solvent, waste material or any other polluting substance into the environment, submit a full written report of the occurrence to the District Manager describing the cause and discovery of the spill or loss, clean-up and recovery measures taken, preventative measures to be taken and schedule of implementation.

(4) The Owner shall prepare and submit a performance report to the District Manager on an annual basis by April 30th. The first such report shall cover the first annual period following the commencement of operation of the works and subsequent reports shall be submitted to cover successive annual periods following thereafter. The reports shall contain, but shall not be limited to, the following information:

(a) a summary and interpretation of all monitoring data and a comparison to the effluent limits outlined in Condition 6, including an overview of the success and adequacy of the sewage works.

(b) a description of any operating problems encountered and corrective actions taken.

(c) a summary of all maintenance carried out on any major structure, equipment, apparatus, mechanism or thing forming part of the sewage works.

(d) a summary of any effluent quality assurance or control measures undertaken in the reporting period.

(e) a summary of the calibration and maintenance carried out on all effluent monitoring equipment, and

(f) a description of efforts made and results achieved in meeting the effluent objectives outlined in Condition 5.

13. LIMITED OPERATIONAL FLEXIBILITY

(1) The Owner may make modifications to the Works in accordance with the Terms and Conditions of this Approval and subject to the Ministry's "Limited Operational Flexibility Criteria for Modifications to Sewage Works", included under Schedule B of this Approval, as amended.

(2) Sewage works under Limited Operational Flexibility shall adhere to the design guidelines contained within the Ministry's publication "Design Guidelines for Sewage Works 2008", as amended.

(3) The Owner shall ensure at all times, that the Works, related equipment and appurtenances which are installed or used to achieve compliance are operated in accordance with all Terms and Conditions of this Approval.

(4) For greater certainty, the following are not permitted as part of Limited Operational Flexibility:

(a) Modifications to the Works that result in an increase of the approved Rated Capacity of the Works.

(b) Modifications to the Works that may adversely affect the approved effluent quality criteria or the location of the discharge/outfall.

(c) Modifications to the treatment process technology of the Works, or modifications that involve construction of new reactors (tanks) or alter the treatment train process design.

(d) Modifications to the Works approved under s.9 of the EPA, and

(e) Modifications to the Works pursuant to an order issued by the Ministry.

(5) Implementation of Limited Operational Flexibility is not intended to be used for piecemeal measures that result in major alterations or expansions.

(6) If the implementation of Limited Operational Flexibility requires changes to be made to the Emergency Response, Spill Reporting and Contingency Plan, the Owner shall, provide a revised copy of this plan for approval to the local fire services authority prior to implementing Limited Operational Flexibility.

(7) For greater certainty, any modification made under the Limited Operational Flexibility may only be carried out after other legal obligations have been complied with, including those arising from the *Environmental Protection Act, Niagara Escarpment Planning and Development Act, Oak Ridges Moraine Conservation Act, Lake Simcoe Protection Act* and *Greenbelt Act.*

(8) At least thirty (30) days prior to implementing Limited Operational Flexibility, the Owner shall complete a Notice of Modifications describing any proposed modifications to the Works and submit it to the District Manager.

(9) The Owner shall not proceed with implementation of Limited Operational Flexibility until the District Manager has provided written acceptance of the Notice of Modifications or a minimum of thirty (30) days have passed since the day the District Manager acknowledged the receipt of the Notice of Modifications.

Schedule A

1. Application for Approval of Industrial Sewage Works submitted by Mr. Richard Weldon, Managing Partner, 2270386 Ontario Inc., dated September 9, 2019 and supporting information prepared by GHD Consulting Engineers.

2. Letter from GHD to Mr. Paul Widmeyer, Ministry of Environment, Conservation and Parks, Re: Permanent Stormwater Management System ECA No. 4142-ASEKJ2 dated September 17, 2019.

3. Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated September 11, 2013 and design specifications and drawings Prepared by Conestoga-Rovers & Associates Ltd., Waterloo, Ontario.

4. Letter from Peter Kemp, B. Eng., Conestoga-Rovers & Associates Ltd., to Stefanos Habtom, P. Eng., dated May 31, 2014 in response to an additional information request dated April 10, 2014.
5. Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated May 15, 2015 and design specifications and drawings for the leachate treatment system prepared by KOESTER CANADA, Brantford, Ontario.

6. Revised Application for Environmental Compliance Approval amendment submitted by 2270386 Ontario Limited dated December 15, 2017 but received on January 8, 2018 and revised design specifications and drawings for the leachate treatment system prepared by KOESTER CANADA, Brantford, Ontario.

Schedule B

Limited Operational Flexibility Criteria for Modifications to Industrial Sewage Works

1. The modifications to sewage works approved under an Environmental Compliance Approval (Approval) that are permitted under the Limited Operational Flexibility (LOF), are outlined below and are subject to the LOF conditions in the Approval, and require the submission of the Notice of Modifications. If there is a conflict between the sewage works listed below and the Terms and Conditions in the Approval, the Terms and Conditions in the Approval shall take precedence.

1.1 Sewage Pumping Stations

a. Alter pumping capacity by adding or replacing equipment where new equipment is located within an existing sewage treatment plant site or an existing sewage pumping station site, provided that the modifications do not result in an increase of the sewage treatment plant Rated Capacity and the existing flow process and/or treatment train are maintained, as applicable.

1.2 Sewage Treatment Process

a. Installing additional chemical dosage equipment including replacing with alternative chemicals for pH adjustment or coagulants (non-toxic polymers) provided that there are no modifications of treatment processes or other modifications that may alter the intent of operations and may have negative impacts on the effluent quantity and quality.

b. Expanding the buffer zone between a sanitary sewage lagoon facility or land treatment area and adjacent uses provided that the buffer zone is entirely on the proponent's land.

c. Optimizing existing sanitary sewage lagoons with the purpose to increase efficiency of treatment operations provided that existing sewage treatment plant rated capacity is not exceeded and where no land acquisition is required.

d. Optimizing existing sewage treatment plant equipment with the purpose to increase the efficiency of the existing treatment operations, provided that there are no modifications to the works that result in an increase of the Rated Capacity, and may have adverse effects to the effluent quality or location of the discharge.

e. Replacement, refurbishment of previously approved equipment in whole or in part with Equivalent Equipment, like-for-like of different make and model, provided that the firm capacity, reliability, performance standard, level of quality and redundancy of the group of equipment is kept the same. For clarity purposes, the following equipment can be considered under this provision: screens, grit separators, blowers, aeration equipment, sludge thickeners, dewatering equipment, UV systems, chlorine contact equipment, bio-disks, and sludge digester systems.

1.3 Sewage Treatment Plant Outfall

a. Replacement of discharge pipe with similar pipe size provided that the outfall location is not changed.

1.4 Sanitary Sewers

a. Pipe relining and replacement with similar pipe size within the Sewage Treatment Plant site, where the nominal diameter is not greater than 1,200 mm.

1.5 Pilot Systems

a. Installation of pilot systems for new or existing technologies provided that:

i. any effluent from the pilot system is discharged to the inlet of the sewage treatment plant or hauled off-site for proper disposal,
ii. any effluent from the pilot system discharged to the inlet of the sewage treatment plant or sewage conveyance system does not significantly alter the composition/concentration of the influent sewage to be treated in the downstream process; and that it does not add any inhibiting substances to the downstream process, and
iii. the pilot system's duration does not exceed a maximum of two years; and a report with results is submitted to the Director and District Manager three months after completion of the pilot project.

2. Sewage works that are exempt from section 53 of the OWRA by O. Reg. 525/98 continue to be exempt and are not required to follow the notification process under this Limited Operational Flexibility.

3. Normal or emergency operational modifications, such as repairs, reconstructions, or other improvements that are part of maintenance activities, including cleaning, renovations to existing approved sewage works equipment, provided that the modification is made with Equivalent Equipment, are considered pre-approved.

4. The modifications noted in section (3) above are <u>not</u> required to follow the notification protocols under Limited Operational Flexibility, provided that the number of pieces and description of the equipment as described in the Approval does not change.

Ontario
Ministry of
the Environment

Notice of Modification to Sewage Works

RETAIN COPY OF COMPLETED FORM AS PART OF THE ECA AND SEND A COPY TO THE WATER SUPERVISOR (FOR MUNICIPAL) OR DISTRICT MANAGER (FOR NON-MUNICIPAL SYSTEMS)

Part 1 – Environmental Compliance Approval (ECA) with Limited Operational Flexibility

(Insert the ECA's owner, number, issuance date and notice number, which should start with "01" and consecutive numbers thereafter)

ECA Number	Issuance Date (mm/dd/yy)	Notice number (if applicable)

ECA Owner	Municipality

Part 2: Description of the modifications as part of the Limited Operational Flexibility

(Attach a detailed description of the sewage works)

Description shall include:
1. A detail description of the modifications and/or operations to the sewage works (e.g. sewage work component, location, size, equipment type/model, material, process name, etc.)
2. Confirmation that the anticipated environmental effects are negligible.
3. List of updated versions of, or amendments to, all relevant technical documents that are affected by the modifications as applicable, i.e. submission of documentation is not required, but the listing of updated documents is (design brief, drawings, emergency plan, etc.)

Part 3 – Declaration by Professional Engineer

I hereby declare that I have verified the scope and technical aspects of this modification and confirm that the design:
1. Has been prepared or reviewed by a Professional Engineer who is licensed to practice in the Province of Ontario;
2. Conforms with the Limited Operational Flexibility as per the ECA;
3. Has been designed consistent with Ministry's Design Guidelines, adhering to engineering standards, industry's best management practices, and demonstrating ongoing compliance with s.53 of the Ontario Water Resources Act; and other appropriate regulations.

I hereby declare that to the best of my knowledge, information and belief the information contained in this form is complete and accurate.

Name (Print)	PEO License Number

Signature	Date (mm/dd/yy)

Name of Employer

Part 4 – Declaration by Owner

I hereby declare that:
1. I am authorized by the Owner to complete this Declaration;
2. The Owner consents to the modification; and
3. These modifications to the sewage works are proposed in accordance with the Limited Operational Flexibility as described in the ECA.
4. The Owner has fulfilled all applicable requirements of the *Environmental Assessment Act*.

I hereby declare that to the best of my knowledge, information and belief the information contained in this form is complete and accurate.

Name of Owner Representative (Print)	Owner representative's title (Print)

Owner Representative's Signature	Date (mm/dd/yy)

Notice of Modifications Dec-2013.pdf

The reasons for the imposition of these terms and conditions are as follows:

1. Condition 1 is imposed to ensure that the Works are built and operated in the manner in which they were described for review and upon which approval was granted. This condition is also included to emphasize the precedence of Conditions in the Approval and the practice that the Approval is based on the most current document, if several conflicting documents are submitted for review.

2. Condition 2 is included to ensure that the Ministry records are kept accurate and current with respect to approved works and to ensure that subsequent Owners of the works are made aware of the Approval and continue to operate the works in compliance with it.

3. Condition 3 is imposed to ensure consistency between approvals granted by the Ministry.

4. Conditions 4 and 11 are included to ensure that a comprehensive operations manual governing all significant areas of operation, maintenance and repair is prepared, implemented and kept up-to-date by the Owner and made available to the Ministry. Such a manual is an integral part of the operation of the works. Its compilation and use should assist the owner in staff training, in proper plant operation and in identifying and planning for contingencies during possible abnormal conditions. The manual will also act as a benchmark for Ministry staff when reviewing the owner's operation of the works.

5. Condition 5 is imposed to establish non-enforceable effluent quality objectives which the Owner is obligated to use best efforts to strive towards on an ongoing basis. These objectives are to be used as a mechanism to trigger corrective action proactively and voluntarily before environmental impairment occurs and before the compliance limits of Condition 5 are exceeded.

6. Conditions 6 and 7 are imposed to ensure that the effluent discharged from the Works to the Brooks Road side ditch meets the Ministry's effluent quality requirements thus minimizing environmental impact on the receiver.

7. Condition 8 is included to ensure that treatment capacity for the leachate treatment system is established based on proper receiving surface water assimilative capacity assessment and effluent limits requirements.

8. Conditions 9 and 10 are included to require the Owner to demonstrate on a continual basis that the quality and quantity of the effluent from the approved Works is consistent with the (design objectives and) effluent limits specified in the Approval and that the approved works does not cause any impairment to the receiving watercourse.

9. Condition 12 is included to provide a performance record for future references and to ensure that the Ministry is made aware of problems as they arise, so that the Ministry can work with the Owner in resolving the problems in a timely manner.

10. Condition 13 is included to ensure that the Works are operated in accordance with the application and supporting documentation submitted by the Owner, and not in a manner which the Director has not been asked to consider. These Conditions are also included to ensure that a Professional Engineer has reviewed the proposed modifications and attests that the modifications are in line with that of Limited Operational Flexibility, and provide assurance that the proposed modifications comply with the Ministry's requirements stipulated in the Terms and Conditions of this Approval, Ministry policies, guidelines, and industry engineering standards and best management practices.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 4142-ASEKJ2 issued on January 29, 2018.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

Notice of Modifications Dec-2013.pdf

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL
NUMBER A110302
Issue Date: October 1, 2021

2270386 Ontario Limited
162 Cumberland St
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd North Cayuga
Haldimand County,
N0A 1E0

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act , R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

a waste disposal site (landfill) with a total site area of 14.3 hectares of which 6 hectares is approved for landfilling.

For the purpose of this environmental compliance approval, the following definitions apply:

"Approval" or "ECA" means this Environmental Compliance Approval and any Schedules to it, including the application and supporting documentation listed in Schedule "A";
"Contaminating Life Span" means contaminating life span as defined in Ontario Regulation 232/98;
"Design and Operations Report" means the Design and Operations Report Vertical Expansion – Rev. 1, Brooks Road Landfill Site, Prepared by GHD, June 14, 2021 that was submitted in support of the Approval
"Director" means any Ministry employee appointed in writing by the Minister pursuant to section 5 of the EPA as a Director for the purposes of Part II.1 of the EPA;
"District Manager" means the District Manager of the local district office of the Ministry in which the Site is geographically located;
"EPA" means Environmental Protection Act, R.S.O. 1990, c. E. 19, as amended;
"Improvement Area" means the area of Brooks Road, between Highway #3 (also known as Talbot Road) and Townline Road;
"Ministry" means the Ontario Ministry of the Environment, Conservation and Parks;
"NMA" means Nutrient Management Act, 2002, S.O. 2002, c. 4, as amended;
"Odour Management Plan" means a document which describes the measures to minimize odour emissions from the Site;
"Operator" means any person, other than the Owner's employees, authorized by the

Owner as having the charge, management or control of any aspect of the Site and includes its successors or assigns;
"Owner" means any person that is responsible for the establishment or operation of the Site being approved by this Approval, and includes 2270386 Ontario Limited and its successors and assigns;
“OWRA” means the Ontario Water Resources Act, R.S.O. 1990, c. O.40, as amended;
“PA” means the Pesticides Act, R.S.O. 1990, c. P-11, as amended;
"Provincial Officer" means any person designated in writing by the Minister as a provincial officer pursuant to Section 5 of the OWRA, Section 5 of the EPA, Section 17 of the PA, Section 4 of the NMA, or Section 8 of the SDWA;
"Refrigerant Appliances" means household appliances which use, or may use refrigerants, and which include, but is not restricted to, refrigerators, freezers and air-conditioning systems;
"Regional Director" means the Regional Director of the local Regional Office of the Ministry in which the Site is located;
"Regulation 232" means Ontario Regulation 232/98 - Landfilling Sites made under the EPA, as amended;
"Regulation 347" or "Reg. 347" means means Regulation 347, R.R.O. 1990, General - Waste Management, made under the EPA, as amended;
"Regulation 406" means means Regulation 406/19, R.S.O. 1990, On-site and Excess Soil Management, made under the EPA, as amended;
"Regulation 558" means Ontario Regulation 558/00 - General Waste Management, made under the EPA, as amended;
"Regulation 903" means Regulation 903 - Wells, R.R.O. 1990, made under the OWRA, as amended;
"SDWA" means Safe Drinking Water Act, 2002, S.O. 2002, c. 32, as amended;
“Site" means the entire waste disposal site, including the buffer lands, at the Brooks Road Landfill Site, Lot 24, Concession 1 North, Haldimand County; and
“Trained Personnel” means personnel knowledgeable in the following through instruction and/or practice:
a. relevant waste management legislation, regulations and guidelines;
b. major environmental concerns pertaining to the waste to be handled;
c. occupational health and safety concerns pertaining to the processes and wastes to be handled;
d. management procedures including the use and operation of equipment for the processes and wastes to be handled;
e. emergency response procedures;
f. specific written procedures for the control of nuisance conditions;
g. specific written procedures for refusal of unacceptable waste loads; and
h. the requirements of this Approval.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. GENERAL

Compliance

(1) This Approval revokes all previous Approvals and Notices of Amendment issued under Part V of the Environmental Protection Act for this Site. The approval given herein, including the terms and conditions set out, replaces all previously issued Approvals and related terms and conditions under Part V of the Act for this Site.
(2) The Owner and Operator shall ensure compliance with all the conditions of this Approval and shall ensure that any person authorized to carry out work on or operate any aspect of the Site is notified of this Approval and the conditions herein and shall take all reasonable measures to ensure any such person complies with the same.
(3) Any person authorized to carry out work on or operate any aspect of the Site shall comply with the conditions of this Approval.

In Accordance

(4) Except as otherwise provided by this Approval, the Site shall be designed, developed, built, operated and maintained in accordance with the documentation listed in the attached Schedule “A”.
(5) 1. Construction and installation of aspects described in Schedule "A" must be completed within 5 years of the later of:
(a) the date this Approval is issued; or
(b) if there is a hearing or other litigation in respect of the issuance of this Approval, the date that this hearing or litigation is disposed of, including all appeals.
2. This Approval ceases to apply in respect of the aspects of the Site noted above that have not been constructed or installed before the later of the dates identified in Condition 1(5)1.

Interpretation

(6) Where there is a conflict between a provision of any document listed in Schedule "A" in this Approval, and the conditions of this Approval, the conditions in this Approval shall take precedence.
(7) Where there is a conflict between the application and a provision in any document listed in Schedule "A", the application shall take precedence, unless it is clear that the purpose of the document was to amend the application and the Ministry approved the amendment.
(8) Where there is a conflict between any two documents listed in Schedule "A", the document bearing the most recent date shall take precedence.
(9) The conditions of this Approval are severable. If any condition of this Approval, or the application of any condition of this Approval to any circumstance, is held invalid or unenforceable, the application of such condition to other circumstances and the remainder of this Approval shall not be affected thereby.

Other Legal Obligations

(10) The issuance of, and compliance with, this Approval does not:
(a) relieve any person of any obligation to comply with any provision of any applicable statute, regulation or other legal requirement; and

(b) limit in any way the authority of the Ministry to require certain steps be taken or to require the Owner and Operator to furnish any further information related to compliance with this Approval.

Adverse Effect

(11) The Owner and Operator shall take steps to minimize and ameliorate any adverse effect on the natural environment or impairment of water quality resulting from the present, past and historical operations at the Site. Such steps may include accelerated or additional monitoring as may be necessary to determine the nature and extent of the effect or impairment.

(12) Despite an Owner, Operator, or any other person fulfilling any obligations imposed by this Approval, the person remains responsible for any contravention of any other condition of this Approval or any applicable statute, regulation, or other legal requirement resulting from any act or omission that caused the adverse effect to the natural environment or impairment of water quality.

(13) At no time shall the Owner or Operator allow the discharge of a contaminant that causes or is likely to cause an adverse effect.

Change of Ownership

(14) The Owner shall notify the Director, in writing, and forward a copy of the notification to the District Manager, within 30 days of the occurrence of any changes in the following information:

(a) the ownership of the Site;

(b) the Operator of the Site;

(c) the address of the Owner or Operator; and

(d) the partners, where the Owner or Operator is or at any time becomes a partnership and a copy of the most recent declaration filed under the Business Names Act, R. S. O. 1990, c. B.17, shall be included in the notification.

(15) No portion of this Site shall be transferred or encumbered prior to or after closing of the Site unless the Director is notified in advance and sufficient financial assurance is deposited with the Ministry to ensure that these conditions will be carried out.

(16) In the event of any change in ownership of the Site, other than change to a successor municipality, the Owner shall notify the successor of and provide the successor with a copy of this Approval, and the Owner shall provide a copy of the notification to the District Manager and the Director.

Registration on Title Requirement

(17) Prior to dealing with the property in any way, the Owner shall provide a copy of this Approval and any amendments, to any person who acquires an interest in the property as a result of the dealing.

(18) (a) If not already completed, within ninety (90) calendar days from the date of issuance of this Approval, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:

(i) a plan of survey prepared, signed and sealed by an Ontario Land Surveyor, which shows the area of the Site where waste has been and is to

be deposited at the Site;
(ii) proof of ownership of the Site;
(iii) a letter signed by a member of the Law Society of Upper Canada or other qualified legal practitioner acceptable to the Director, verifying the legal description provided in the Certificate of Requirement;
(iv) the legal abstract of the property; and
(v) any supporting documents including a registerable description of the Site.

(b) If not already completed, within fifteen (15) calendar days of receiving a Certificate of Requirement authorized by the Director, the Owner shall:

(i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and
(ii) submit to the Director and the District Manager, written verification that the Certificate of Requirement has been registered on title.

Registration on Title Requirement - Contaminant Attenuation Zone (CAZ)
(19) Within thirty (30) calendar days from the date of establishing a contaminant attenuation zone (CAZ) (overburden and/or bedrock aquifers) in either fee simple or by way of a groundwater easement, the Owner shall submit to the Director a completed Certificate of Requirement which shall include:
(a) If rights are obtained in fee simple, the Owner shall provide:

(i) documentation evidencing ownership of the CAZ obtained in compliance with Regulation 232, as amended;
(ii) a completed Certificate of Requirement and supporting documents containing a registerable description of the CAZ; and
(iii) a letter signed by a member of the Law Society of Upper Canada; or other qualified legal practitioner acceptable to the Director, verifying the legal description of the CAZ.

(b) within fifteen (15) calendar days of receiving a Certificate of Requirement signed or authorized by the Director,the Owner shall:

(i) register the Certificate of Requirement in the appropriate Land Registry Office on the title to the property; and
(ii) submit to the Director and the District Manager, a written verification that the Certificate of Requirement has been registered on title.

(c) If rights are obtained by way of a groundwater easement, the Applicant shall:

(i) provide a copy of the agreement for the easement;
(ii) provide a plan of survey signed and sealed by an Ontario Land Surveyor

for the CAZ; and
(iii) submit proof of registration on title of the groundwater easement to the Director and District Manager;

(d) The Owner shall not amend, or remove, or consent to the removal of the easement or CAZ from title without the prior written consent of the Director.

Inspections by the Ministry

(20) No person shall hinder or obstruct a Provincial Officer from carrying out any and all inspections authorized by the OWRA, the EPA, the PA, the SDWA or the NMA, of any place to which this Approval relates, and without limiting the foregoing:
(a) to enter upon the premises where the approved works are located, or the location where the records required by the conditions of this Approval are kept;
(b) to have access to, inspect, and copy any records required to be kept by the conditions of this Approval;
(c) to inspect the Site, related equipment and appurtenances;
(d) to inspect the practices, procedures, or operations required by the conditions of this Approval; and
(e) to sample and monitor for the purposes of assessing compliance with the terms and conditions of this Approval or the EPA, the OWRA, the PA, the SDWA or the NMA.

Information and Record Retention

(21) (a) Except as authorized in writing by the Director, all records required by this Approval shall be retained at the Site for a minimum of two (2) years from their date of creation.
(b) The Owner shall retain all documentation listed in Schedule “A” for as long as this Approval is valid.
(c) All information and logs required in Conditions 9(1), 10(1), 11(3), 11(4), 12(3), and 12(4) shall be kept at the Site until they are included in the Annual Report.
(d) The Owner shall retain employee training records as long as the employee is working at the Site.
(e) The Owner shall make all of the above documents available for inspection upon request of Ministry staff.
(22) The receipt of any information by the Ministry or the failure of the Ministry to prosecute any person or to require any person to take any action under this Approval or under any statute, regulation or other legal requirement, in relation to the information, shall not be construed as:
(a) an approval, waiver, or justification by the Ministry of any act or omission of any person that contravenes any term or condition of this Approval or any statute, regulation or other legal requirement; or
(b) acceptance by the Ministry of the information’s completeness or accuracy.
(23) The Owner shall ensure that a copy of this Approval, in its entirety and including all its Notices of Amendment, and documentation listed in Schedule "A", are retained at the Site at all times.
(24) Any information related to this Approval and contained in Ministry files may be

made available to the public in accordance with the provisions of the Freedom of Information and Protection of Privacy Act, RSO 1990, CF-31.

2. FINANCIAL ASSURANCE

(1) (a) Within twenty (20) days of issuance of this Notice, the Owner shall submit to the Director, Financial Assurance as defined in Section 131 of the Environmental Protection Act, in the amount of **$8,371,282.00.** This Financial Assurance shall provide sufficient funds for the closure and post-closure care/monitoring of the Site.

(i) The total amount of financial assurance specified in Condition 2(1)(a) shall be updated by the Owner, as follows, by the specified dates:

i. October 1, 2021 - **$9,956,333.00**
ii. October 1, 2022 - **$11,541,383.00**
iii. October 1, 2023 - **$10,424,285.00**
iv. October 1, 2024 - **$10,097,075.00**

(b) Commencing on October 1, 2023 and on a three (3) year basis thereafter, the Owner shall provide to the Director a re-evaluation of the amount of the Financial Assurance to facilitate the actions required under Condition 2(1)(a). The re-evaluation shall include an assessment based on any new information relating to the environmental conditions of the Site and shall include the costs of additional monitoring and/or implementation of alternative measures required by the Director upon review of the annual reports. The Financial Assurance must be submitted to the Director within twenty (20) days of written acceptance of the re-evaluation by the Director;

(c) The amount of Financial Assurance is subject to review at any time by the Director and may be amended at his/her discretion. If any Financial Assurance is scheduled to expire or notice is received, indicating Financial Assurance will not be renewed, and satisfactory methods have not been made to replace the Financial Assurance at least sixty (60) days before the Financial Assurance terminates, the Owner shall forthwith replace the Financial Assurance with cash.

3. SITE OPERATION

Operation

(1) The Site shall be operated and maintained at all times including management and disposal of all waste, in accordance with the EPA, Regulation 347, Regulation 232, and the conditions of this Approval.

Service Area

(2) Waste categories of Industrial, Commercial and Institutional ("ICI waste"), generated from within the geographic boundaries of the Province of Ontario may be received for disposal at this Site.

Waste Types

(3) Only solid non-hazardous ICI waste, including contaminated soils, and processed

organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant), shall be received for disposal at this Site. No hazardous waste or liquid industrial waste , as defined in Reg. 347, as amended by Reg. 558/00, shall be disposed at this Site.
(4) The Owner shall develop and implement a program to inspect waste to ensure that the waste received at the Site is of a type approved for acceptance under this Approval.
(5) The Owner shall ensure that all loads of waste are properly inspected by Trained Personnel prior to acceptance at the Site and that the waste vehicles are directed to the appropriate areas for disposal or transfer of the waste. The Owner shall notify the District Manager, in writing, of load rejections at the Site within one (1) business day from their occurrence.

Approved Waste Quantities

(6) The maximum volumetric capacity for the Site including waste and daily cover shall not exceed 1,045,065 cubic metres.
(7) The Owner shall ensure that the waste received at the Site does not exceed:
(a) a total of 250,000 tonnes in any calendar year; and
(b) the daily maximum received at the site does not exceed 1,000 tonnes.

Waste Placement

(8) No waste shall be landfilled outside of the approved six (6) hectare footprint fill area. The site shall be developed, maintain established buffer areas, and adhere to final contours for waste and final cover material in accordance with the design drawings provided in Appendix L of the Design and Operations Report.
(a) The maximum elevation of the fill zone, including final cover, shall be 221.50 metres above mean sea level.

Signage

(9) A sign shall be installed and maintained at the main entrance/exit to the Site on which is legibly displayed the following information:
(a) the name of the Site and Owner;
(b) the number of the Approval;
(c) the name of the Operator;
(d) the normal hours of operation;
(e) the allowable and prohibited waste types;
(f) the telephone number to which complaints may be directed;
(g) a warning against unauthorized access;
(h) a twenty-four (24) hour emergency telephone number (if different from above); and
(i) a warning against dumping outside the Site.
(10) All landfill signs shall be kept legible, in good repair, and cleaned when required.

Nuisance Control (Vermin, Vectors, Dust, Litter, Odour, Noise and Traffic)

(11) The Site shall be operated and maintained such that vermin, vectors, dust, litter, odour, noise and traffic do not create a nuisance.
(12) The Owner/Operator shall install visual screening berms, in accordance with the Design and Operations Report and shall inspect and maintain them as required, during the operating life of the landfill Site.

(13) The Owner/Operator shall conduct inspections and ensure that appropriate controls are in place to prevent the acceptance of liquid industrial waste and hazardous waste and to prevent the acceptance of waste from outside the approved service area. Records of violations by haulers or waste generators shall be maintained in the daily records for the Site operations. The Owner/Operator shall ensure that any waste refused for disposal leaves the Site immediately, and the District Manager is notified forthwith, of all waste load refusals at the Site related to requirements in this Certificate, including service area and waste types.
(14) The Owner/Operator shall ensure that the leachate collection system piping in the fill area and the connecting forcemain piping which leads to the leachate holding tank, shall be cleaned out at least once per year with a high pressure wash, and video inspections conducted, as necessary, to confirm that the pipes are clean and to determine the need for more frequent cleaning. Assessment of the need to amend the cleaning frequency shall be based on regular inspections of the leachate collection system and monitoring results.
(15) A thickness of at least 5 metres of compacted waste and cover material shall be maintained between any landfilled sludge (solid non-hazardous as per Reg. 347) and the granular leachate collection layer and leachate monitoring wells.
(16) The Owner/Operator shall take all reasonable steps to prevent off-site nuisance impacts, including visual impacts, transfer of waste, mud, or dust from the Site onto public roads due to landfill operations.

Burning of Waste

(17) Burning of waste at the Site is prohibited.

Scavenging

(18) Scavenging (as defined in Reg. 347) of deposited and/or stockpiled waste is prohibited at the Site. Controlled removal of recycleable/reusable material from the Site may only occur in a designated paved area on the Site, and shall be supervised by Trained Personnel.

Hours of Operation

(19) The permitted hours of operation for the site are from 6:00 a.m. to 6:00 p.m., Monday to Friday, and from 6:00 a.m. to 2:00 p.m. on Saturdays, for site preparation, site maintenance and daily cover activities. The operating hours for receipt of waste for disposal at the Site shall be from 7:00 a.m. to 5:00 p.m., Monday to Friday, and from 7:00 a.m. to 1:00 p.m., on Saturdays. No operations shall take place at the Site outside of the stated hours and the Site shall be closed on statutory holidays.
(20) The hours of operation may be amended from time to time to accommodate seasonal or unusual demand, based on prior consultation with the PLC and written concurrence from the District Manager.

Site Security

(21) No waste shall be received, landfilled or removed from the Site unless a site supervisor or other Trained Personnel are present to supervise the operations during operating hours. The Site shall be closed when a supervisor or Trained Personnel are not present to supervise operations at the Site.

(22) The Site shall be operated and maintained in a safe and secure manner. During non-operating hours, the Site entrance and exit gates shall be locked and the Site shall be secured against access by unauthorized persons.

Cover Material

(23) Alternative materials to soil may be used as weekly and interim cover material, based on an application with supporting information and applicable fee for a trial use or permanent use, submitted by the Owner to the Director, copied to the District Manager and as approved by the Director via an amendment to this Approval. The alternative material shall be non-hazardous according to Regulation 347 and will be expected to perform at least as well as soil in relation to the following functions:

(a) control of blowing litter, odours, dust, landfill gas, gulls, vectors, vermin and fires;

(b) provision for an aesthetic condition of the landfill during the active life of the Site;

(c) provision for vehicle access to the active tipping face; and

(d) compatibility with the design of the Site for groundwater protection, leachate management and landfill gas management.

(24) Daily, interim and final cover material shall be shall be applied as follows:

a. Daily Cover - At the end of each working day, the entire working face shall be compacted and covered with a minimum thickness of 150 mm of soil cover, compost, wood chips, or other approved daily cover material. Prior to placing waste at the start of the next operating day, the existing daily cover material shall be scarified or removed to the extent practical, to ensure vertical hydraulic connection is maintained between layers of waste and to promote percolation of leachate downwards to the leachate collection system.

b. Interim Cover - In areas where landfilling ceases temporarily for a period of 6 months or more, a minimum thickness of 300 mm of soil shall be placed as interim cover and graded to promote surface water runoff. The quality of soil for use as interim cover shall, as a minimum, meet the standards specified in Table 3 of Soil, Groundwater and Sediment Standards for use under Part XV.1 of the Environmental Protection Act. Prior to the use of interim cover soil, representative samples shall be taken and analysed for metals, Volatile Organic Compounds (VOCs) and PAHs, to confirm the soil meets the above-mentioned standards.

c. Final Cover - Final cover shall be applied progressively as areas of the landfill reach final waste elevations within the fill area. Prior to placement of final cover, the Owner/Operator shall submit for the approval of the Director, a report detailing the specifications, including particle size distribution of the final cover soil which shall confirm the designed infiltration rate of 0.15 m/year, as well as the protocols for testing and acceptance for on-site and off-site final cover soils. All areas of final cover shall be graded and vegetated as soon as practically possible. The final soil cap shall be regularly inspected and maintained after the installation and during the post-closure period. Without limiting the above, the Owner/Operator shall ensure for a minimum of five years after completion of the cap that the Site shall be inspected at least on a quarterly basis to ensure that there is positive drainage along the cap and that during the frost free period of the first two years following completion, such inspections shall

be monthly. If any inspection indicates that there is an area of ponding or zero slope, the Owner/Operator shall take all steps necessary to provide positive drainage and rehabilitate the final cover as soon as practically possible.
d. All on-site and excess soil used for daily, interim, and final cover shall be managed in accordance with Regulation 406.

Traffic Control

(25) The Owner/Operator shall ensure that vehicles carrying waste or materials to and from the Site shall only enter the Site from Highway #3 and Brooks Road. At no time shall any vehicle carrying waste or materials to and from the Site travel along Townline Road to access the Site.
(26) The Owner/Operator shall be responsible for maintenance and remedial work to the Improvement Area. The Improvement Area shall be maintained to the following minimum requirements:
(a) 300 mm thick granular "A" layer of gravel, meeting all applicable Haldimand County and Ontario Provincial Standards Specification (OPSS) to the Improvement Area; and
(b) Maintain asphalt on the entranceway/exit to the landfill and the parking area for the landfill Site, as well as 30 metres of the road approach on Brooks Road to the entranceway/exit to the Site, extending both north and south of the entranceway/exit, in base asphalt and top coat. The thickness of asphalt shall be a base coarse of 60 mm (HL8), and a surface coarse of 50 mm (HL3).

4. GROUNDWATER AND SURFACE WATER MONITORING

Compliance

(1) The Site shall be operated in such a way as to ensure compliance with the following:
(a) Reasonable Use Guideline B-7 for the protection of the groundwater at the Site; and
(b) Provincial Water Quality Objectives included in the July 1994 publication entitled Water Management Policies, Guidelines, Provincial Water Quality Objectives, as amended from time to time, or limits set by the Regional Director, or the Canadian Water Quality Guidelines published by the Canadian Council of Ministers of the Environment, 1999 for the protection of the surface water at and off the Site.

Surface Water and Groundwater

(2) The Owner shall monitor surface water and groundwater in accordance with the environmental monitoring program outlined in Schedule "B".
(3) A certified Professional Geoscientist or Engineer possessing appropriate hydrogeologic and hydrologic training and experience shall execute or directly supervise the execution of the environmental monitoring and reporting program.

Groundwater Wells and Monitors

(4) The Owner shall ensure that all groundwater monitoring wells which form part of the monitoring program are properly capped, locked and protected from damage and maintained in accordance with Regulation 903.
(5) Where landfilling is to proceed around monitoring wells, suitable extensions shall be added to the wells and the wells shall be properly re-secured.
(6) Any groundwater monitoring well included in the on-going monitoring program that

is damaged shall be assessed, repaired, replaced or decommissioned by the Owner, as required.

(a) The Owner shall repair or replace any monitoring well which is destroyed or in any way made to be inoperable for sampling such that no more than one regular sampling event is missed.

(b) All monitoring wells which are no longer required as part of the groundwater monitoring program, and have been approved by the Director or the District Manager for abandonment, shall be decommissioned by the Owner, as required, in accordance with Regulation 903, to prevent contamination through the abandoned well. A report on the decommissioning of the well shall be included in the Annual Report for the period during which the well was decommissioned.

Trigger Mechanisms and Contingency Plans

(7) In the event of a confirmed exceedance of a site-specific trigger level relating to groundwater or surface water impacts due to leachate, the Owner shall immediately notify the District Manager, and an investigation into the cause and the need for implementation of remedial or contingency actions shall be carried out by the Owner in accordance with the approved trigger mechanisms and associated contingency plans provided in Appendix J of the Design and Operations Report.

(8) If monitoring results, investigative activities and/or trigger mechanisms indicate the need to implement contingency measures, the Owner shall ensure that the following steps are taken:

(a) the Owner shall notify the District Manager, in writing of the need to implement contingency measures, no later than seven (7) days after confirmation of the exceedances;

(b) within thirty (30) days from the date of confirming the need to implement contingency measures, detailed plans, specifications and descriptions for the design, operation and maintenance of the contingency measures shall be prepared and submitted by the Owner to the Director for approval; and

(c) the contingency measures shall be implemented by the Owner upon approval by the Director.

(9) The Owner shall ensure that any proposed changes to the site-specific trigger levels for leachate impacts to surface water or groundwater, are approved in advance by the Director via an amendment to this Approval.

Changes to the Monitoring Plan, Trigger Mechanism and Contingency Plan

(10) The Owner may request to make changes to the environmental monitoring program, Trigger Mechanism and Contingency Plan to the District Manager in accordance with the recommendations of the annual report. The Owner shall make clear reference to the proposed changes in a separate letter that shall accompany the annual report.

(11) Within fourteen (14) days of receiving the written correspondence from the District Manager confirming that the District Manager is in agreement with the proposed changes to the environmental monitoring program, the Owner shall forward a letter

identifying the proposed changes and a copy of the correspondences from the District Manager and all other correspondences and responses related to the changes to the monitoring program, to the Director requesting the Approval be amended to approve the proposed changes to the environmental monitoring plan prior to implementation.

(12) In the event any other changes to the environmental monitoring program are proposed outside of the recommendation of the annual report, the Owner shall follow current Ministry procedures for seeking approval for amending the Approval.

5. LEACHATE MANAGEMENT AND DISPOSAL

(1) Leachate generated at the landfill Site shall be collected, treated and disposed of using the on-site Leachate Treatment System, in accordance with the terms and conditions of the Industrial Sewage Works Approval No. 1122-BKUPSM dated February 3, 2020, as amended.

(a) Notwithstanding Condition 5(1), leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall be removed to an off-site facility that is approved by the Ministry to treat leachate generated at the landfill Site.

(2) Leachate generated at the landfill Site that is not treated using the on-site Leachate Treatment System shall not be discharged to the natural environment at any time.

(3) Any alternative proposal for leachate management and disposal must receive prior written approval of the District Manager.

(4) The Owner shall reduce the level of leachate within the landfill to an elevation 191 metres above mean sea level (AMSL), which equates to an average leachate depth of no greater than 0.3 metres, by the earlier of:

(a) five (5) years from the issuance date of this ECA; or

(b) the date the landfill reaches capacity.

(5) In addition to the requirements of Condition 5(4), the interim annual leachate elevation levels and interim landfill capacity-based leachate elevations shall be adhered to pursuant to Schedules "C" and "D" respectively.

(a) The leachate elevation, as determined by the pressure transducer located in the leachate collection sump riser pipe shall be used to establish the landfill leachate elevation. The leachate elevation will be considered in compliance with the target leachate elevations if the measurement meets the elevations stated in Schedules "C" and "D" within fifteen (15) days of the compliance date.

(6) The Owner shall implement the leachate management contingency measures in the report titled "Leachate Removal Plan – Revision 2, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited", prepared June 1, 2021, as amended, as necessary to meet the leachate elevations in Schedules "C" and "D".

(a) if the leachate elevations in Schedules "C" and "D" are not met within 105 days of the anniversary date of the issuance of this Approval the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below the leachate elevation in Schedules "C" and "D":

(i) notify the District Manager;
(ii) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site;
(iii) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site;
(iv) install interim cover to cells that have not reached final waste contours and to the working face;
(v) install final cover to cells that have reached final waste contours;
(vi) establish vegetation on installed cover material where appropriate and weather permitting; and
(vii) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.

(b) landfilling activities may commence again when the compliance leachate elevation has been attained; and
(c) prior to amending the Leachate Removal Plan proposed amendments shall be submitted to the District Manager for approval.
(7) If the leachate elevation in the landfill reaches 199.0 metres AMSL, the Owner shall cease accepting waste at the Site and immediately undertake the following actions until the leachate elevation is below 199.0 metres AMSL:
(a) notify the District Manager;
(b) increase trucking of raw leachate to an off-Site facility approved to accept leachate from the Site;
(c) increase trucking of treated leachate from the on-Site leachate treatment system to an off-Site facility approved to accept treated leachate from the Site;
(d) install interim cover to cells that have not reached final waste contours and to the working face;
(e) install final cover to cells that have reached final waste contours;
(f) establish vegetation on installed cover material where appropriate and weather permitting; and
(g) provide a plan to the District Manager regarding additional contingency measures deemed to be appropriate.
(8) The Owner shall monitor leachate in accordance with the monitoring program outlined in Schedule "B".

6. LANDFILL GAS MANAGEMENT

(1) The Owner/Operator shall ensure that all buildings and structures containing enclosed spaces at the Site, shall be situated, constructed and monitored in a manner which minimizes the potential for explosive hazards due to landfill gas. The Owner/Operator shall install and maintain in good working condition, methane detection

and alarm equipment (with active venting or with an effective passive venting system to relieve any possible landfill gas accumulation) for all enclosed buildings at the Site.
(2) The Owner/Operator shall ensure that site design plans, specifications and descriptions for the control of landfill gas are such that the subsurface migration of landfill gas meets the requirements of the Ministry's Landfill Standards Guideline, Section 4.10, including but not limited to the following:
(a) the concentration of methane gas below the ground surface at the Site boundary must be less than 2.5 per cent by volume;
(b) the concentration of methane gas in any on-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, if the building or structure is accessible to any person or contains electrical equipment or a potential source of ignition, must be less than 1.0 per cent by volume;
(c) sub-condition (b) does not apply to a leachate collection, storage or treatment facility or a landfill gas collection or treatment facility for which specific health and safety measures and procedures are in place relating to the risk of asphyxiation and the risk of explosion; and
(d) the concentration of methane gas from the Site in any off-Site building or enclosed structure, and in the area immediately outside the foundation or basement floor of the building or structure, must be less than 0.05 per cent by volume (i.e. not present).
(3) If the measured gas concentration at a gas probe exceeds the applicable limit listed in Condition 6(2) above, the District Manager shall be notified immediately. The gas concentrations shall be re-measured immediately and daily for a period of up to three
(3) consecutive days. If these readings confirm that the applicable limit has been exceeded, the Owner/Operator shall forthwith, implement appropriate control measures.
(4) The Owner shall monitor landfill gas in accordance with the monitoring program outlined in Schedule "B".

7. STORMWATER MANAGEMENT

(1) Stormwater runoff generated from the active waste fill area shall be treated by the Owner/Operator as leachate. The Owner/Operator shall ensure that any precipitation falling unto active waste fill areas, not under interim cover, shall be directed to the leachate collection system. If necessary, granular sumps shall be dug into the waste to facilitate drainage of contaminated stormwater towards the leachate collection system.
(2) The Owner shall monitor the stormwater management pond in accordance with the monitoring program outlined in Schedule "B".

8. EMPLOYEE TRAINING

(1) A training plan for all employees that operate any aspect of the Site shall be developed and implemented by the Owner or the Operator. Only Trained Personnel shall operate any aspect of the Site or carry out any activity required under this Approval.
(2) The Owner shall ensure that all site operations employees have been adequately trained and received on-going training with respect to the following, but not limited to:
(a) terms, conditions and operating requirements of this Approval for the Site;

(b) the operation, inspection, and maintenance of the Site with respect to the approved design and operations documents;
(c) relevant waste management legislation and regulations;
(d) environmental concerns related to waste management at the Site;
(e) occupational Health and Safety concerns related to waste management at the Site; and
(f) emergency procedures and contingency plans in case of fire, spills, off-site impacts and any other emergency situations.

9. COMPLAINTS RESPONSE PROCEDURE

(1) If at any time the Owner receives complaints regarding the operation of the Site, the Owner shall respond to these complaints according to the following procedure:
(a) The Owner shall record and number each complaint, either electronically or in a log book, and shall include the following information: the nature of the complaint, the name, address and the telephone number of the complainant if the complainant will provide this information and the time and date of the complaint;
(b) The Owner, upon notification of the complaint, shall initiate appropriate steps to determine possible causes of the complaint, proceed to take the necessary actions to eliminate the cause of the complaint and forward a written reply to the complainant; and
(c) The Owner shall complete and retain on-site a report written within one (1) week of the complaint date, listing the actions taken to resolve the complaint and recommendations, if any, for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents.

10. EMERGENCY AND SPILL RESPONSE

(1) All Spills as defined in the EPA occurring at or from the Site shall be immediately reported to the **Ministry's Spills Action Centre at 1-800-268-6060** and shall be recorded in the log book. The Owner/Operator shall record for each Spill event the contaminant(s) spilled, the quantity or volume of contaminants spilled, the spatial distribution of the area impacted by the Spill, a root cause analysis of the events leading up to the Spill and a list of actions designed to prevent similar Spill events.
(2) In addition, the Owner shall submit, to the District Manager a written report within three (3) business days of the Spill event, outlining the nature of the incident, remedial measures taken, handling of waste generated as a result of the emergency situation and the measures taken to prevent future occurrences at the Site.
(3) All wastes resulting from a Spill event shall be managed and disposed of in accordance with the EPA and Regulation 347.
(4) All equipment and materials required to handle the Spill event shall be:
(a) kept on hand at all times that waste landfilling and/or handling is undertaken at the Site; and
(b) adequately maintained and kept in good repair.
(5) The Owner shall ensure that the emergency response personnel are familiar with the use of such equipment and its location(s).

11. PUBLIC LIAISON COMMITTEE (PLC)

(1) The Owner or Operator shall maintain and participate in a landfill PLC, which shall

function in accordance with the Terms of Reference for the PLC, as amended from time to time. Any amendment to the Terms of Reference must be approved by the District Manager. The PLC shall serve as a forum for dissemination, consultation, review and exchange of information regarding the operation of the landfill Site, including environmental monitoring, maintenance, complaint resolution, and new approvals or amendments to existing approvals related to the operation of this landfill Site.
(2) The Owner/Operator shall invite representation from the following groups to participate on the PLC:
(a) the County of Haldimand;
(b) Six Nations of the Grand River;
(c) landowners within a minimum 500 metre distance of the Site;
(d) residents of Haldimand County; and
(e) Lower Grand River Land Trust.
The number of representatives from each group shall be as specified in the Terms of Reference approved by the District Manager.
(3) Copies of all reports or other submissions required by the conditions of this Approval shall be made available to the PLC and the County of Haldimand, in accordance with the deadlines specified in the Conditions.
(4) The Owner or Operator shall provide to the PLC and the County of Haldimand, reasonable notice and opportunities to make comments regarding any proposed amendment to this Approval. The Owner or Operator shall forward to the Director for consideration any written comments received by the Owner or Operator and advise the Director of the essence of any verbal comments received by the Owner or Operator regarding the proposed amendment.

12. INSPECTIONS, RECORD KEEPING AND REPORTING

Daily Inspections and Inspection Log

(1) A visual inspection of the entire Site and all equipment on the Site shall be conducted each day the Site is open to ensure that:
(a) the Site is secure;
(b) the operation of the Site is not causing any nuisances;
(c) the operation of the Site is not causing any adverse effects on the environment or impairing water quality; and
(d) the Site is being operated in compliance with this Approval.
(2) Any deficiencies discovered as a result of the inspection shall be remedied immediately, including temporarily ceasing operations at the Site if needed **.**
(3) An electronic or written record of the inspections shall be maintained and shall include the following:
(a) the name and signature of person that conducted the inspection;
(b) the date and time of the inspection;
(c) the list of all deficiencies discovered during the inspections, including but not limited to:

(i) the presence of any leachate seeps;
(ii) the condition of the methane venting system;
(iii) poor drainage conditions and ponding of surface water; and
(iv) the presence of waste outside of the approved fill area;

(d) the recommendations for remedial action to address the identified deficiencies; and
(e) the date, time and description of the remedial actions taken.

Daily Waste Log

(4) A daily log shall be maintained in written or electronic format and shall include the following information:
(a) the type, date and estimated quantity (tonnes) of all waste, including non-landfilled waste received at the Site;
(b) the type, date and estimated quantity (tonnes) of cover material applied at the Site;
(c) the area of the Site in which waste disposal operations are taking place;
(d) a record of litter collection activities and the application of any dust suppressants;
(e) a record of all refusals of waste shipments, the reason(s) for refusal, and the origin of the waste, if known; and
(f) a description of any out-of-service period of any control, treatment, disposal or monitoring facilities, the reasons for the loss of service, and action taken to restore and maintain service.

Other Information

(5) Any information requested, by the Director, the District Manager or a Provincial Officer, concerning the Site and its operation under this Approval, including but not limited to any records required to be kept by this Approval shall be provided to the Ministry, upon request.

Annual Report

(6) A written report on the development, operation and monitoring of the Site, shall be completed annually (the “Annual Report”). The Annual Report shall be submitted to the District Manager, by March 31st of the year following the period being reported upon.
(7) The Annual Report shall include but not be limited to the following information:
(a) the results and an interpretive analysis of the results of all leachate, groundwater surface water and landfill gas monitoring, including an assessment of the need to amend the monitoring programs;
(b) an assessment on the Site’s compliance with Guideline B7;
(c) an assessment of the operation and performance of all engineered facilities, the need to amend the design or operation of the Site, and the adequacy of and need to implement the Ministry approved contingency plans;
(d) site plans showing the existing contours of the Site; areas of landfilling operation during the reporting period; areas of intended operation during the next reporting period; areas of excavation during the reporting period; the progress of final cover, vegetative cover, and any intermediate cover application; facilities existing, added or

removed during the reporting period; and site preparations and facilities planned for installation during the next reporting period;
(e) summaries of any actions taken for the odour management plan and compliance with the leachate removal plan;
(f) summaries of any actions taken for the compliance with the leachate removal plan;
(g) calculations of the volume of waste, daily and intermediate cover, and final cover deposited or placed at the Site during the reporting period and a calculation of the total volume of Site capacity used during the reporting period;
(h) a calculation of the remaining capacity of the Site or an estimate of the remaining Site life;
(i) summary of total annual quantity (tonnes) of waste received at the Site;
(j) a summary of any complaints received and the responses made;
(k) a summary of the information included in the logs required by Conditions 9(1), 10(1), 11(3), 11(4), 11(5), and 12(2);
(l) a summary of the daily waste log;
(m) a discussion of any operational problems encountered at the Site and corrective action taken;
(n) any changes to the Ministry approved Design and Operations Report and the Closure Plan that have been approved by the Director since the last Annual Report;
(o) a report on the status of all monitoring wells and a statement as to compliance with Regulation 903;
(p) a description and location of any leachate seeps identified during the daily inspection of the Site and the mitigative measures taken to address the presence of seeps;
(q) a summary of the daily inspections conducted over the monitoring period;
(r) any other information with respect to the Site which the District Manager may require from time to time;
(s) a copy of the most current ministry approved monitoring programs in table format;
(t) compliance status with all conditions of the Approval and the approved Design and Operations Plan;
(u) a "Monitoring and Screening Checklist" completed and signed by a Qualified Professional; and
(v) items identified in Section 7.7 Annual Progress Report of the Design and Operations Report;

13. CLOSURE PLAN

(1) At least two (2) years prior to the anticipated date of closure of this Site, or when the Site reaches 90% capacity, whichever comes first, the Owner shall submit to the Director for approval, with copies to the District Manager, a detailed Site closure plan pertaining to the termination of landfilling operations at this Site, post-closure inspection, maintenance and monitoring, and end use. The plan shall include but not be limited to the following information:
(a) A plan showing Site appearance after closure;
(b) A description of the proposed end-use of the Site;

(c) Description of the procedures for closure of the Site, including:

i. advance notification of the public of the landfill closure;
ii. posting of a sign at the Site entrance indicating the landfill is closed and identifying any alternative waste disposal arrangements;
iii. completion, inspection and maintenance of the final cover and landscaping;
iv. site security;
v. removal of unnecessary landfill-related structures, buildings and facilities;
vi. final construction of any control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas; and
vii. a schedule indicating the time-period for implementing sub-conditions (i) to (vi) above.

(d) Description of the procedures for post-closure care of the Site, including:

i. operation, inspection and maintenance of the control, treatment, disposal and monitoring facilities for leachate, groundwater, surface water and landfill gas;
ii. record keeping and reporting; and
iii. complaint contact and response procedures;

(e) An assessment of the adequacy of and need to implement the contingency plans for leachate and landfill gas;
(f) An updated estimate of the contaminating life span of the Site, based on the results of the monitoring programs to date; and
(g) An update of the cost estimate for financial assurance and the amount which has been provided to the Director.
(2) The Site shall be closed in accordance with the closure plan as approved by the Director.
The following Schedule "A" forms part of this Approval

Schedule "A"

1. Application for an amendment to ECA No. A110302 for a vertical expansion. Signed by Richard Weldon, Managing Partner, 2270386 Ontario Limited. Dated April 26, 2019. The application includes all supporting documentation and consists of the following:

i. Design and Operations Report Vertical Expansion, Brooks Road Landfill Site, 2270386 Ontario Inc., Prepared by GHD, April 18, 2019;
ii. Appendix A - Provisional CofA No. A110302 and Amendments;
iii. Appendix B - Site Preparation Reports;
iv. Appendix C - Site Legal Surveys;
v. Appendix D - Geotechnical Assessment;
vi. Appendix E - HELP Model Outputs;
vii. Appendix F - Hydrologic Modeling;
vii. Appendix G - Surface Water Supporting Engineering Calculations;
viii. Appendix H - Landfill Gas Production and Air Dispersion Modeling Results;
ix. Appendix I - Fugitive Odour Best Management Practices Plan and BRE Odour Complaint Response Procedure;
ix. Appendix J - Trigger Level Program;
ix. Appendix K - Financial Assurance Plan; and
ix. Appendix L - Design and Operations Report Drawings.

2. Leachate Removal Plan, Brooks Road landfill Site Haldimand County, 2270386 Ontario Limited. Report No 90. Prepared by GHD, February 7, 2020.
3. Environmental Compliance Approval Application. Signed by Richard Weldon, Managing Partner, 2270386 Ontario Limited. Dated June 1, 2021.
4. Design and Operations Report, Vertical Expansion – Rev. 1, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited. Prepared by GHD, Signed/stamped and dated June 14, 2021.

5. Leachate Removal Plan - Revision 2, Brooks Road Landfill Site, Haldimand County, 2270386 Ontario Limited. Prepared by GHD, June 1, 2021.

The following Schedule "B" forms part of this Approval

Notes:

1. Groundwater levels will be measured during May and November sampling events.
2. Surface water levels and flows will be measured for all sampling events.
3. **A - Indicator parameters (groundwater):** alkalinity, ammonia, barium, boron,

calcium, chloride, conductivity, iron, magnesium, nitrate, pH, sodium, TDS, sulphate, COD, and DOC.

4. **B - Metals:** aluminum, arsenic, barium, beryllium, boron, cadmium, total chromium, copper, iron, lead, magnesium, manganese, mercury, silver, sodium, zinc, vanadium, thallium, molybdenum, cobalt, nickel.

B - PAHs: naphthalene, acenaphthylene, acenaphthene, fluorene, phenanthrene, anthracene, fluoranthene, pyrene, benzo(a)anthracene, chrysene, benzo(b)fluoranthene, benzo(k)fluoranthene, benzo(j)fluoranthene, benzo(a)pyrene, indeno(1,2,3-cd)pyrene, dibenzo(a,h)anthracene, benzo(ghi)perylene.

B - VOCs: chloromethane, vinyl chloride, bromomethane, chloroethane, trichlorofluoromethane, acetone, 1,1-dichloroethene, dichloromethane, trans-1,2-dichloroethene, methyl-t-butyl ether, 1,1-dichloroethane, methyl ethyl ketone, cis-1,2-dichloroethene, chloroform, 1,2-dichloroethane, 1,1,1-trichloroethane, carbon tetrachloride, benzene, 1,2-dichloropropane trichloroethene, bromodichloromethane, cis-1,3-dichloropropene, methyl isobutyl ketone, trans-1,3-dichloropropene, 1,1,2-trichloroethane, toluene, 2-hexanone, dibromochloromethane, 1,2-dibromoethane, tetrachloroethene, 1,1,1,2-tetrachloroethane, chlorobenzene, ethylbenzene, m,p,o-xylenes, bromoform, styrene, 1,1,2,2-tetrachloroethane, 1,3-dichlorobenzene, 1,4-dichlorobenzene, 1,2-dichlorobenzene.

B - Inorganic chemistry parameters: alkalinity, ammonia, hardness, nitrate, nitrite, TKN, chloride, sulfates, DOC, TDS, suspended solids, phenol, BOD5, COD, pH, total phosphorus, potassium, conductivity, calcium.

5. **C - Indicator parameters (surface water):** alkalinity, ammonia, chloride, conductivity, iron, nitrate, nitrite, TKN, pH, total phosphorus, TDS, suspended solids, sulphate, BOD5, COD, phenol, temperature, and dissolved oxygen.

6. **WL - only:** water level or leachate level only.

7. **Leachate:** Leachate water levels shall be collected on a monthly basis at leachate monitoring well LW1-17 and the inclined leachate collection sump riser pipe, while an annual leachate chemistry sample is required to be collected in May from the collection sump. Compliance with the leachate level elevation shall be determined by the pressure transducer that is located in the leachate collection sump riser pipe.

8. **Landfill Gas:** Sampling is to occur monthly from December 1 to April 30 and quarterly from May through November for % lower explosive limit methane concentration of combustible gas, carbon dioxide, oxygen and balance gases, gas pressure, and water level.

The following Schedule "C" forms part of this Approval

Schedule "C"

Table C1: Target leachate elevations to reach leachate elevation 191 m AMSL based on the date of March 27, 2020.

Date	Required Leachate Elevation	Estimated Leachate Volume in	Volume Removed in Excess of	Forecasted Leachate Generation	LTS Discharge to Ditch (m	Required Average Excess

	(m AMSL)	Landfill (m^3)	Generation (m^3)	Rate (m^3 /day)	^{3} /day)	Leachate Removal (m^3 /day)
March 27, 2020	198.5	40,000	-	44	45	0
March 27, 2021	196	28,000	12,000	44	45	32
March 27, 2022	193.8	18,000	10,000	42	45	24
March 27, 2023	192.1	10,000	8,000	44	45	21
March 27, 2024	191.3	4,000	6,000	45	45	16
March 27, 2025	191	2,000	2,000	49	45	9.5
March 27, 2026	191	2,000	0	33	45	0

The following Schedule "D" forms part of this Approval

Schedule "D"

Table D1: Capacity-Based Target Leachate Elevations

Estimated Landfilled Volume (m^3)	Required Leachate Elevation (m AMSL)
680,000	197.9
710,000	197.4
740,000	196.8
770,000	196.2
800,000	195.7
830,000	195.1

890,000	193.9
920,000	193.4
950,000	192.8
980,000	192.2
1,010,000	191.7
1,040,000	191.1
1,045,065	191.0

The reasons for the imposition of these terms and conditions are as follows:

Conditions 1(1), 1(2), 1(4), 1(5), 1(6), 1(7), 1(8), 1(9), 1(10), 1(11), 1(13), 1(20), 1(21), 1(22), and 1(23) are to clarify the legal rights and responsibilities of the Owner and Operator under this Approval.
Conditions 1(3) and 7(4) are to ensure that the Site is designed, operated, monitored and maintained in accordance with the application and supporting documentation submitted by the Owner, and not in a manner which the Director has not been asked to consider.
Condition 1(12) is to ensure that the Site is operated under the corporate name which appears on the application form submitted for this approval and to ensure that the Director is informed of any changes.
Condition 1(14) is to restrict potential transfer or encumbrance of the Site without the approval of the Director and to ensure that any transfer of encumbrance can be made only on the basis that it will not endanger compliance with this Approval.
Condition 1(15) is to ensure that the successor is aware of its legal responsibilities.
Conditions 1(16), 1(17) and 1(18) clarify that the Part II.1 Director is an individual with authority pursuant to Section 197 of the Environmental Protection Act to require registration on title and provide any person with an interest in property before dealing with the property in any way to give a copy of the Approval to any person who will acquire an interest in the property as a result of the dealing.
Condition 1(19) is to ensure that appropriate Ministry staff has ready access to the Site for inspection of facilities, equipment, practices and operations required by the conditions in this Approval. This Condition is supplementary to the powers of entry afforded a Provincial Officer pursuant to the Act, the OWRA, the PA, the NMA and the SDWA.
Condition 1(24) clarifies what information may be subject to the Freedom of Information Act.
Condition 2(1) is to ensure that sufficient funds are available to the Ministry for closure and post-closure activities at the Site in the event that the Owner is unable or unwilling to do so.
Conditions 3(1), 3(11), 3(12), 3(13), 3(14), 3(15), 3(16), 12(1) and 12(2) are to ensure that the Site is operated, inspected and maintained in an environmentally acceptable manner and does not result in a hazard or nuisance to the natural environment or any person.
Conditions 3(2), 3(3), 3(4), and 3(5) are to specify the approved area from which waste may be accepted at the Site, and the types of waste that may be accepted for disposal at the Site based on the Owner's application and supporting documentation.
Conditions 3(6), 3(7), and 3(8) are to specify restrictions on the extent of landfilling and the maximum rates to be accepted for disposal at the Site based on the Owner's application and supporting documentation. These limits define the approved volumetric capacity of the site.
Conditions 3(9) and 3(10) are to ensure that users of the Site are fully aware of important information and restrictions related to Site operations and access under this Approval.

Condition 3(17) is to ensure open burning of municipal waste is unacceptable because of concerns with air emissions, smoke and other nuisance effects, and the potential fire hazard.
Condition 3(18) is to ensure that uncontrolled removal of material from waste at the Site is avoided. Scavenging of deposited waste can be detrimental to the public health and safety and cause damage to the natural environment.
Conditions 3(19) and 3(20) are to specify the hours of operation for the landfill site and a mechanism for amendment of the hours of operation, as required.
Conditions 3(21) and 3(22) are to ensure that the Site is supervised by properly trained staff in a manner which does not result in a hazard or nuisance to the natural environment or any person and to ensure the controlled access and integrity of the Site by preventing unauthorized access when the Site is closed and no site attendant is on duty.
Condition 3(23) is to specify the approval requirements for use of alternative cover material at the Site.
Condition 3(24) is to ensure that daily and intermediate cover is used to control potential nuisance effects, to facilitate vehicle access on the site, and to ensure an acceptable site appearance is maintained. The proper closure of a landfill site requires the application of a final cover which is aesthetically pleasing, controls infiltration, and is suitable for the end use planned for the site.
Condition 3(25) is to ensure that potential truck traffic impacts on the immediate local community is limited to the existing main roads.
Condition 3(26) is to ensure that public road servicing the Site (described as "Improvement Area") meets the applicable standards. Condition 3(26) also ensures that the Improvement Area is maintained regularly as per agreement between the Owner/Operator of the Site and Haldimand County.
Condition 4(1) is to provide the groundwater and surface water limits to prevent water pollution at the Site
Conditions 4(2), 4(3), 5(2), 6(4), and 7(2) are included to require the Owner to demonstrate that the Site is performing as designed and the impacts on the natural environment are acceptable. Regular monitoring allows for the analysis of trends over time and ensures that there is an early warning of potential problems so that any necessary remedial/contingency action can be taken.
Conditions 4(4), 4(5), and 4(6) are included to ensure the integrity of the groundwater monitoring network so that accurate monitoring results are achieved and the natural environment is protected.
Conditions 4(7), 4(8), and 4(9) are added to ensure the Owner has a plan with an organized set of procedures for identifying and responding to potential issues relating to groundwater and surface water contamination at the Site's compliance point.
Conditions 4(10), 4(11), and 4(12) are included to streamline the approval of the changes to the monitoring plan.
Condition 5(1) is added to ensure that leachate generated at this Site is disposed of in an environmentally acceptable manner.

Conditions 6(1), 6(2), 6(3), and 6(5) are to ensure that off-site migration of landfill gas is monitored and all buildings at the Site are free of any landfill gas accumulation, which due to a methane gas component may be explosive and thus create a danger to any persons at the Site.
Condition 7(1) is added to ensure to ensure that both surface water and stormwater is managed in an environmentally acceptable manner.
Conditions 8(1) and 8(2) are to ensure that the Site is operated by properly trained staff in a manner which does not result in a hazard or nuisance to the natural environment or any person.
Condition 9(1) is added to ensure that any complaints regarding landfill operations at this Site are responded to in a timely and efficient manner.
Condition 10(1) is to ensure the Owner immediately responds to a spill.
Conditions 10(2), 10(3), 10(4), and 10(5) are to ensure that the Owner notifies the Ministry forthwith of any spills so that an appropriate response can be determined.
Conditions 11(1), 11(2), 11(3), and 11(4) are added to establish a forum for the exchange of information and public dialogue on activities carried out at the landfill Site. Open communication with the public and local authorities is important in helping to maintain high standards for site operation and protection of the natural environment.
Condition 12(3) is to ensure that detailed records of Site inspections are recorded and maintained for inspection and information purposes.
Condition 12(4) and 12(5) are added to ensure that accurate waste records are maintained to ensure compliance with the conditions in this Approval (such as fill rate, site capacity, record keeping, annual reporting, and financial assurance requirements), the EPA and its regulations.
Conditions 12(6) and 12(7) are added to ensure that regular review of site development, operations and monitoring data is documented and any possible improvements to site design, operations or monitoring programs are identified. An annual report is an important tool used in reviewing site activities and for determining the effectiveness of site design.
Condition 13(1) is added to ensure that final closure of the Site is completed in an aesthetically pleasing manner, in accordance with Ministry standards, and to ensure the long-term protection of the health and safety of the public and the environment.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). A110302 issued on March 27, 2020

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;

b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment, Conservation and Parks
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 326-5370 or** www.ert.gov.on.ca

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 1st day of October, 2021

Mohsen Keyvani, P.Eng.
Director
appointed for the purposes of Part II.1 of the *Environmental Protection Act*

Instructions for Completing Form

- For use in the **Province of Ontario** only. This document is a permanent **legal** document. Please retain for future reference.
- All Sections **must** be completed in full to avoid delays in processing. Further instructions and explanations are available on the back of this form.
- Questions regarding completing this application can be directed to the Water Well Management Coordinator at 416-235-6203.
- **All metre measurements shall be reported to 1/10th of a metre.**
- Please print clearly in blue or black ink only.

Ministry Use Only: MUN | CON | LOT

Instructions for Completing Form

- For use in the **Province of Ontario** only. This document is a permanent **legal** document. Please retain for future reference.
- All Sections **must** be completed in full to avoid delays in processing. Further instructions and explanations are available on the back of this form.
- Questions regarding completing this application can be directed to the Water Well Management Coordinator at 416-235-6203.
- **All metre measurements shall be reported to 1/10th of a metre.**
- Please print clearly in blue or black ink only.

Ministry Use Only

Table index

Figure index

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown in Figure 1.1.

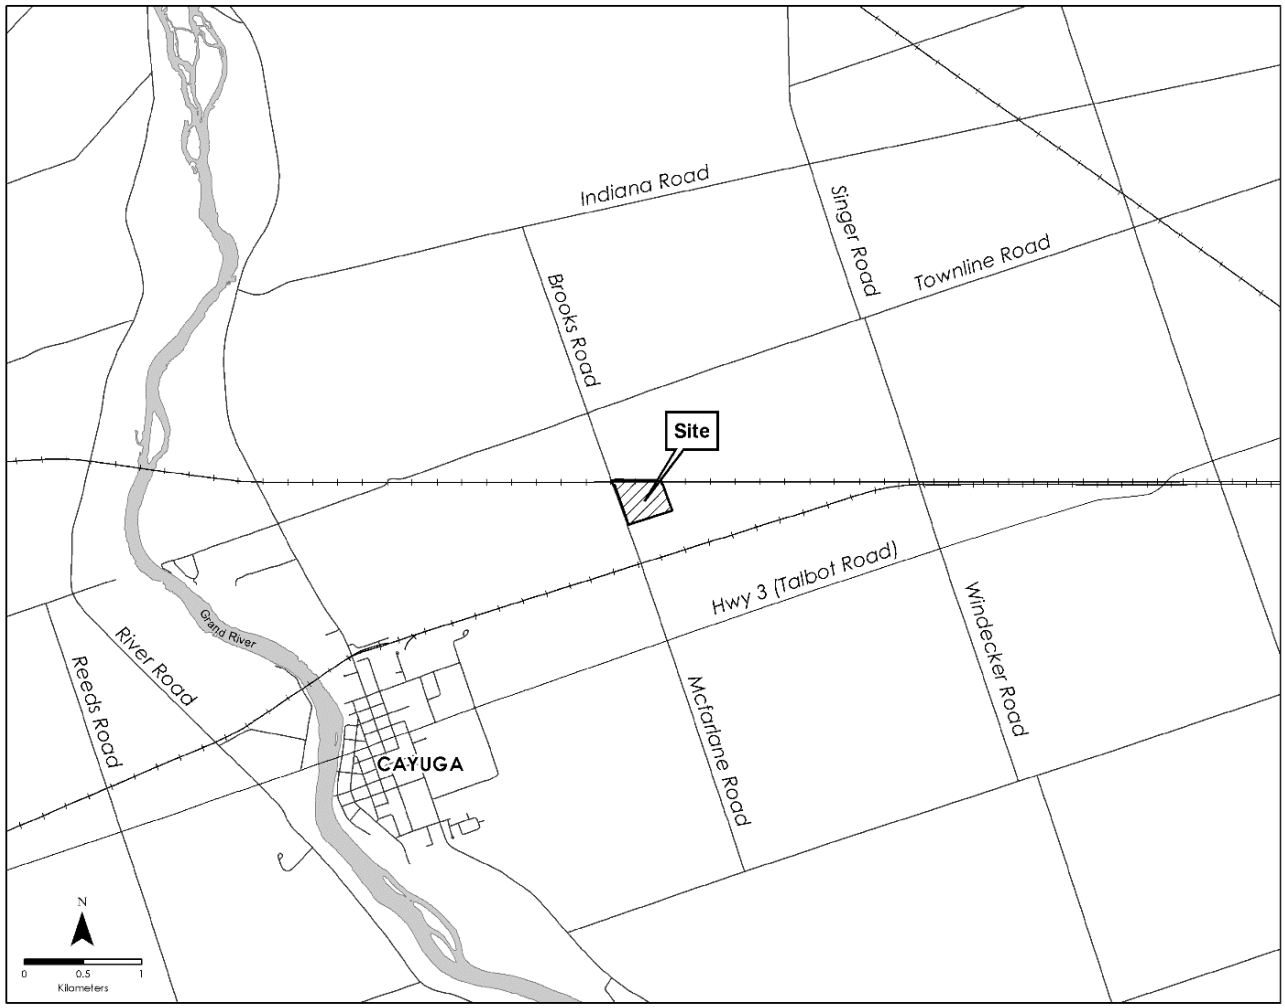

Figure 1.1 Location of the Proposed Undertaking

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (Landfill ECA), has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA) and industrial sewage works ECA No. 1122-BKUPSM (Industrial Sewage ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the Site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road

Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customers for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by approximately 219,400 m^3, adding capacity equal to approximately two additional years. This expansion would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown in Figure 1.2.

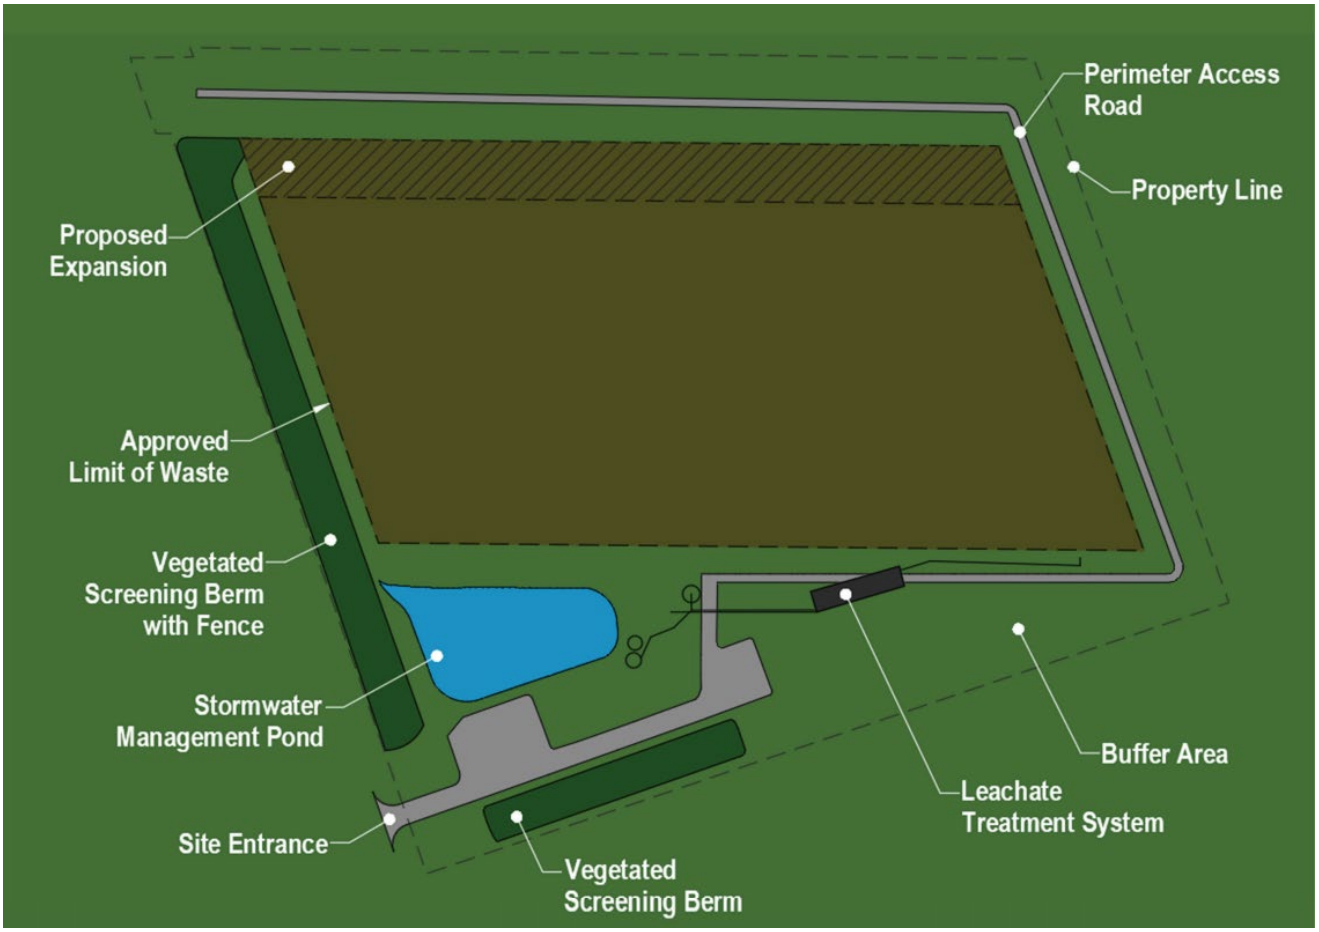

Figure 1.2 Proposed Capacity Expansion Concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by approximately 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:

1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening Process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302.

GHD has prepared a Land Use & Socio-Economic Assessment on behalf of BRE to support the proposed undertaking. This report documents the following as it relates to the land use & socio-economic environment:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project).
– Potential effects on the environment, mitigation measures, and net effects.
– Future monitoring requirements to be implemented.

The Study Areas reviewed for the Land Use assessment were as follows (see Figure 1.3):

– **Site Study Area (SSA)** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended.
– **Site-Vicinity Study Area** – the area within the vicinity of the Site extending approximately 500 meter (m) in all directions.
– **Local Study Area (LSA)** - the area within the vicinity of the Site extending approximately 1 kilometer (km) in all directions.

2. Screening Criteria Checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act*

As noted in the Guide:

*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required.*

Where a "Yes" has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion".

Each criterion is based on a question which is prefaced with the phrase, "Might the Project…" The Table 2.1 below was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Land Use and Socio-Economic disciplines. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in **Section 4.0** of this report.

Table 2.1 Screening Criteria Checklist

	Criterion	YES	NO	Additional Information
	Might the project…			
Land				
2.1	Cause negative effects on residential, commercial, institutional, or other sensitive land uses within 500 metres from the site boundary?		X	The proposed undertaking is a continuation of the existing operation through an expansion within the existing site. No change to land use is being proposed. As such, no negative effects are anticipated on the lands or land uses within 500m the Site as a result of the Project.
2.2	Not be consistent with the Provincial Policy Statement, provincial land use or resource management plans?		X	The proposed landfill expansion would continue to be consistent with the Provincial Policy Statement, provincial land use and/or resource management plans.
2.3	Be inconsistent with municipal land use policies, plans and zoning bylaws (including municipal setbacks)?		X	The proposed landfill expansion would continue to be consistent with municipal land use policies, plans and zoning bylaws (including municipal setbacks). No new lands are required and no changes to existing zoning are required.
2.4	Use lands not zoned as industrial, heavy industrial or waste disposal?		X	The proposed landfill expansion would not require new lands or changes to existing zoning.
2.5	Use hazard lands or unstable lands subject to erosion?	X		The proposed landfill expansion may require the use of hazard lands or GRCA regulated lands.

	Criterion	YES	NO	Additional Information
2.6	Cause negative effects related to the remediation of contaminated land?		X	The proposed landfill expansion would not cause negative effects related to the remediation of contaminated land.
Socio-Economic				
6.1	Cause negative effects on neighborhood or community character?		X	The proposed undertaking is an expansion to an already approved and existing landfill within the existing site. As such, no negative effects on the neighbourhood or community character are anticipated on as a result of the Project.
6.2	Result in aesthetics impacts (e.g., visual and litter impacts)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause aesthetic impacts due to the increase in landfill height in the expansion area.
6.3	Cause negative effects on local businesses, institutions, or public facilities?		X	The proposed undertaking is a continuation of the existing operation through an expansion within the existing site. No change to land use is being proposed. As such, no negative effects are anticipated to local businesses, institutions, or public facilities.
6.4	Cause negative effects on recreation, cottaging or tourism?		X	The proposed landfill expansion would not result in negative effects on recreation, cottaging or tourism as none of the above-mentioned uses have been identified within the Study Areas.
6.5	Cause negative effects related to increases in the demands on community services and infrastructure?		X	The proposed landfill expansion would not cause negative effects related to increases in the demands on community services and infrastructure.
6.6	Cause negative effects on the economic base of a municipality or community?		X	The proposed landfill expansion would not cause negative effects on the economic base of a municipality or community.
6.7	Cause negative effects on local employment and labour supply?		X	The proposed landfill expansion would not cause negative effects on local employment and labour supply. The continued use of the landfill will provide economic benefits to the local community in the form of new employment opportunities in both the construction and day to day operation. There is also the potential for increased employment opportunities in local firms.
6.8	Cause negative effects related to traffic?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects related to traffic through prolonging the life of the Site.
6.9	Be located within 8 km of an aerodrome/airport reference point?	X		Three aerodromes have been identified within 8km of the Site: – Cayuga (Bruce Field), approximately 1.3 km south of the Site – Cayuga East, approximately 3 km southeast of the Site – Grand River Executive, approximately 7.5 km north of the Site

	Criterion	YES	NO	Additional Information
6.10	Interfere with flight paths due to the construction of facilities with height (i.e., stacks)?		X	The proposed landfill expansion would not interfere with flight paths.
6.11	Cause negative effects on public health and safety?		X	The proposed landfill expansion would not cause any negative effects on public health and safety.

3. Existing Conditions

The following subsections describe the existing conditions that are found within the SSA, LSA and Site Vicinity Study Areas of the proposed project.

3.1 Land Use Existing Conditions

3.1.1 Methodology

3.1.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Land Use Study Team to determine existing Land Use conditions within the study area(s). The following sources of secondary information were collected and reviewed:

- Review of current zoning plans, definitions, and land use designations
- Ontario Planning Act
- Provincial Policy Statement (2020)
- Provincial Guidelines D-1: Land Use Compatibility (1995)
- Haldimand County Official Plan (2019)
- Haldimand County Zoning By-Law HC 1-2020
- Grand River Conservation Authority
- Statistic Canada (Population Census 2021)
- Land Use Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment report prepared by GHD in December 2016[1]

3.1.2 Description of Existing Conditions

The existing land uses around the Site are primarily agricultural and wetlands. The Site is bordered by Brooks Road to the west, and agricultural and wetland areas to the other three sides. There is an abandoned railways to the north of the Site.

3.1.2.1 Sensitive Uses Within 500 Metres

Sensitive land uses are defined in the Provincial Policy Statement (PPS), 2020 as "*buildings, amenity areas, or outdoor spaces where routine or normal activities occurring at reasonably expected times would experience one or more adverse effects from contaminant discharges generated by a nearby major facility. Sensitive land uses may be a*

[1] Land Use Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment report prepared by GHD in December 2016. Available at: **https://www.brenvironmental.com/_files/ugd/8a04be_52c65748fecb46d481aadbe2e5a33bb7.pdf**

part of the natural or built environment. Examples may include, but are not limited to residences, day care centers, and educational and health facilities."

The existing Site is located at 160 Brooks Road, in Cayuga, Haldimand County, Ontario. The proposed expansion will take place within the site boundaries and will not require the use of any new lands. There are two identified residential properties located within the Site Vicinity Study Area, the closest is approximately 223 m northwest of the site. There are no identified institutional or recreational land uses in a 500 meters radius of the Site boundary.

3.1.2.2 Provincial Policy Statement

The Provincial Policy Statement (PPS), 2020[2] provides clear policy direction on land use planning to promote strong communities, a strong economy, and a clean and healthy environment[3]. In terms of land use compatibility, the PPS 2020 (Section 1.2.6.1) states that "*Major facilities and sensitive land uses shall be planned and developed to avoid, or if avoidance is not possible, minimize and mitigate any potential adverse effects from odour, noise and other contaminants, minimize risk to public health and safety, and to ensure the long-term operational and economic viability of major facilities in accordance with provincial guidelines, standards and procedures*".

The PPS 2020 defines 'major facilities' as facilities which may require separation from sensitive land uses (as defined in Section 3.1.2.1, above), including but not limited to airports, manufacturing uses, transportation infrastructure and corridors, rail facilities, marine facilities, sewage treatment facilities, waste management systems, oil and gas pipelines, industries, energy generation facilities and transmission systems, and resource extraction activities.

Section 1.6.10.1 of the PPS 2020 notes that "*waste management systems need to be provided that are of an appropriate size and type to accommodate present and future requirements, and facilitate, encourage and promote reduction, reuse and recycling objectives… [and that] waste management systems shall be located and designed in accordance with provincial legislation and standards."*

The SSA, Site-Vicinity, and LSA are currently in compliance with the policies contained in the PPS 2020.

3.1.2.3 Grand River Conservation Authority (GRCA) Regulation

In accordance with Ontario Regulation 150/06, GRCA regulates areas where development could be subject to flooding, erosion or dynamic beaches, and where interference with wetlands and alterations to shorelines and watercourses might adversely affect those environmental features. Any of these activities within the Regulated Area may require a permit from the GRCA[4].

A portion of the Site area falls within the GRCA regulated area (Figure 3.1) and may require a permit.

[2] **Provincial Policy Statement, 2020 - Under the Planning Act (ontario.ca)**
[3] It should be noted that the PPS was recently updated, and the proposed changes (PPS, 2023) were out for public consultation until August 4, 2023. The proposed changes do not impact the PPS analysis.

3.1.2.4 Planned Developments

There are currently no planned or proposed developments surrounding the Site[5].

3.1.2.5 Municipal Land Use Policies, Plans, Zoning Bylaws

The Study Areas are situated within the unincorporated community of Cayuga in Haldimand County. The County's Official Plan and Zoning By-Laws were received to determine how the land in the Study Area is to be used in the future based on municipal planning policy.

The predominance of agriculture as the primary designated land use in the Study Areas is expected to remain for the foreseeable future with very little change based on the current municipal planning policy adopted by the County of Haldimand.

Haldimand County Official Plan (HCOP)

The Study Area is designated as Active Waste Landfill Site and surrounding is Provincially Significant Wetlands and Agriculture.

Provincially Significant Wetlands – There are delineated Provincially Significant Wetlands within the SSA. As per Section 2. A. 1) of the HCOP, certain compatible uses may be permitted through an appropriately scoped Environmental Impact Study resulting in no negative impact on the natural features or ecological functions of wetland or wetland complex.

Agriculture – Majority of the Site Vicinity Study Area is designated agricultural. As per Section 3. A. 1) of the HCOP, the predominant use of lands within the agriculture designation shall be agriculture. Other uses compatible with agriculture such as animal kennels, forestry uses, and conservation related uses may be permitted.

HCOP 34 (Specific policies in Haldimand County) – The abandoned railway, located north of the existing landfill is under the HCOP 34 policy area. A waste disposal site is permitted in addition to the uses permitted in the agricultural designation. The permitted uses under waste disposal site are limited to stockpiling of clean clay, location of ground waste monitoring wells, and a general naturalized buffer area. Waste disposal or landfilling is not permitted in this designation.

Hal 36 (Policies in the former Town of Haldimand) – As per Hal 36, policies in the Official Plan relating to Provincially Significant Wetlands (Section 2. A. 1)), and Natural Environment Areas (Section 2. A. 3)) will not apply to the Brooks Road Landfill (formerly known as Edwards Landfill Site).

Haldimand County Zoning By-Law HC 1-2020

The Haldimand County zones the subject site as Disposal Industrial (MD) and Wetland (W). The land in the LSA is zoned as Agricultural (A) and Wetland (W). (see Figure 3.2).

Disposal Industrial

The SSA is zoned as Disposal Industrial. The permitted uses include waste disposal site, waste transfer site, and waste processing facility along with other compatible uses.

Wetland

A portion of the SSA and majority of the Site Vicinity and LSA is zoned as Wetland (W). The permitted uses include parks, woodlot management, conservation area, and tent and trailer park. Under Section 12.2, Hal 36.325 (Zone Exceptions) of the zoning by-law, the minimum setbacks from the wetland zone shall not apply to the commercial buildings existing on the date of passing of the by-law.

[5] Haldimand County Planning Applications. Available at: **https://haldimand.maps.arcgis.com/apps/dashboards/945e90b55d484fd0a01253953129dc0f**

Agricultural

A larger portion of the Site-Vicinity and the LSA is zoned Agricultural. Permitted uses in the Agricultural Zone include residential (bed and breakfast establishments, single detached dwellings, and several accessory uses), agricultural, and commercial (animal hospital, animal kennel, commercial greenhouse) uses.

3.2 Socio-Economic Existing Conditions

3.2.1 Methodology

3.2.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Socio-Economic Study Team to determine existing Socio-Economic conditions within the study area(s). The following sources of secondary information were collected and reviewed:

– Review of current zoning plans, definitions, and land use designations
– Statistics Canada
– Haldimand County Community Profile
– Review of results from other discipline investigations (e.g., noise, air quality, surface water and traffic)
– Socio-Economic Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment report prepared by GHD in December 2016[6]

3.2.2 Description of Existing Conditions

3.2.2.1 Neighbourhood & Community Character

The proposed facility expansion site is located within the community of Cayuga in Haldimand County. The proposed site is designated as Active Waste Disposal Site within the Haldimand County Official Plan and zoned Disposal Industrial (MD) and Wetlands (W) in the Haldimand County Zoning By-law.

Haldimand County is located in the Golden Horseshoe region of Ontario. The community has a rural landscape of 1,251 km², including 83 km of shoreline along Lake Erie.

According to the 2021 Census[7], the County recorded a population of 49,216 in 2021, which is projected to increase to between 67,000 and 68,000 by 2041[8]. The age groups with the largest representation are the 55-59 and 60-64 cohorts. There is an equal distribution of males and females throughout the age groups and a greater part of the households falls within the income brackets of $150k and above. About 4% of total population is Indigenous, largely First Nations and Métis, and 3% are visible minorities, with South Asian and Black visible minority groups more represented than other groups.

Almost half of the total population has completed high school and college education. Common fields of study include engineering, business management, and health related fields. A major part of the labour force is employed in manufacturing, health care, and construction industries. The employment rate was about 56% in 2021 with 8.3% of unemployment rate in the same year.

Eighty-five percent of the residents own their home and 15% are renters. The new housing construction project has increased from 2020[9]. Forty-nine projects under construction and 101 completed projects were reported in the fourth quarter of 2022.

The closest residential dwelling is located approximately 223 m northwest of the Site (see Figure 3.3).

Print date: 27 Mar 2024 - 09:32

Data source: Image ©2024 Google, Airbus, Imagery Date 11/2/2023

3.2.2.2 Visual

The existing visual landscape within the SSA, Site-Vicinity Study Area, and LSA can be described as rural, agricultural, and includes regional roads. There is a wire fence around the perimeter of the site. The western part of the existing Site located on Books Road has a visual berm which includes a chain link fence with visual screen as mitigation to visual impact, providing a visual barrier to passersby.

3.2.2.3 Local Businesses, Institutions or Public Facilities

In addition to farming, the only other business operating within the LSA is the Brooks Road Landfill Site, which employs six full-time and one part-time staff. The are no other businesses, institutions or public facilities located within the LSA.

3.2.2.4 Local Employment & Labor Supply

According to the 2021 Census, there are total 24,335 residents in the labour force, of which 20,645 are employees and 3,675 are self-employed. Majority of the employed are in trade and transport occupations (26%), sales and services (22%), business and finance (14%), education, law, and government (10%), and healthcare (8%). The employment rate in 2021 was 56.6% and participation rate was 61.8%. The unemployment rate was recorded to be 8.3% in the same year.

A major part of the labour force is into manufacturing, health care, and construction industry. The employment rate was about 56% in 2021 with 8.3% of unemployment rate in the same year.

The Brooks Road Landfill Site employs six full-time and one part-time staff.

3.2.2.5 Traffic

Highway 3 and Brooks Road are the two major roads providing access to the existing Brooks Landfill. Traffic on Brooks Road is predominantly truck traffic specific to the landfill operation. Traffic on Highway 3 is a mix of both commuter and truck traffic. The capacity analysis under peak operations confirms no current capacity constraints in the LSA road network. Further details on traffic (existing conditions and potential effects) are included in the Traffic Assessment Report, prepared concurrently with this report by GHD.

3.2.2.6 Social

The LSA is located within the boundaries of Haldimand County, Ontario, approximately 2 km northeast the Village of Cayuga. There are 39 property parcels within the LSA (not including the Site) and 11 residential dwellings. Of these 39 properties, 19 were Farm Tax Rated for the 2022 tax year[10]. The closest residential dwelling is located approximately 223 m northwest of the Site.

No static recreational resources (e.g., picnic areas, trailer parks), churches, or cemeteries are located within the LSA; however, Brooks Road as well as the abandoned railway to south of the Site (parallel to Highway 3) are identified in the Official Plan as trail locations and in the Haldimand County Trails Master Plan 2009 as “Proposed Special Use Routes” (Brooks Road as a “Proposed Signed Route” and the abandoned railway as a Proposed Multi-Use Trail”) for implementation in the short-term (0 to 5 years from the publication date). There is presently no indication of the implementation of the proposed trails along either of these routes.

The topography across the LSA from north to south ranges from approximately 202 m AMSL to approximately 196 m AMSL. As such, the land within the LSA can be considered to be relatively flat. The majority of the lands within the LSA immediately adjacent to the Site are forested, thus obscuring the view of the Site. The exception is the parcel of land immediately west of the Site, which includes an open field, from which the Site is visible; however, the existing berm along the western perimeter of the Site obscures most views of the landfilling operations from this parcel. The

[10] Government of Ontario. (2022). *AgMaps – Agricultural Information Atlas*. Source: **AgMaps (gov.on.ca)**

existing visual berm includes a chain link fence with visual screen as mitigation to visual impact, providing a visual barrier to passersby from Brooks Road.

3.2.2.7 Airport

There are three private airfields within the 8 km radius of the Site: the Cayuga (Bruce Field) Airport, approximately 1.5 km south; the Cayuga East Airport, approximately 3 km southeast; and the Grand River Executive Airport (also referred to as the York Airport) approximately 7.5 km north of the Site.

4. Description of Project Components and Activities

A Project Description, which includes a Site Plan, was prepared so that potential environmental effects and mitigation measures could be identified. Figure 4.1 is provided as the Site Plan and the following subsections provide a general summary of the proposed undertaking.

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved landfill is provided in Table 4.1.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted by 30 m. East and west ditches will extend to maintain full perimeter ditch.
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

5. Potential Effects, Mitigation Measures & Net Effects

There is no significant impact to the predominantly agricultural land uses within the Study Areas as the proposed undertaking will not be acquiring any new lands.

5.1 Methodology and Investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

The land use and socio-economic existing conditions characterized for each criterion identified in the Screening Criteria Checklist were assessed, taking into consideration the Project Description and Site Plan in order to identify potential effects that may result from the proposed undertaking. Following the determination of potential effects, measures required to mitigate any potential effects were developed and the resulting net effects (with the application of mitigation measures) were determined.

5.2 Land Use Net Effects

This Section provides an assessment of the potential negative environmental effects for those Land Use criteria which might be affected by the project (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Area(s) would change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2**, a “Yes” was applied to the following Land Use criteria:

Land Use				
	Criterion	YES	NO	Additional Information
2.5	Use hazard lands or unstable lands subject to erosion?	X		The proposed landfill expansion may require the use of hazard lands or GRCA regulated lands.

5.2.1 Potential Effects on Land Use Environment

The proposed undertaking is compatible with planning and by-law documents for the area and would continue to be consistent with the Provincial Policy Statement. Expansion of the landfill will not affect land uses within 500 m as all operations will continue to take place within the existing site boundaries. BMPs will be implemented by BRE to manage nuisance related effects during construction and operation.

The proposed expansion may require the use of hazard lands or lands subject to erosion such as GRCA-regulated lands. On-site operations may cause potential negative effects on the geology and hydrogeology as well as on the natural habitat and wildlife in this area.

As identified in the Screening Criteria Checklist and **Section 3.1.2.3** above, portions of the SSA, Site Vicinity, and LSA are GRCA regulated areas and zoned as Wetlands. The proposed expansion will require GRCA permit to expand within the regulated lands.

5.2.2 Mitigation Measures

Potential negative effects on the natural environment and wildlife will be mitigated through BMPs such as the final cover system, leachate collection system, and liner system. In addition to these engineered controls, the Site is also situated within a fine grained (clay rich) stratigraphic sequence with significant vertical thickness. This natural feature provides additional protection of the underlying aquifer as well as some beneficial attenuation capacity. A silt fence is also installed in areas of possible sediment migration.

Detailed mitigation measures are outlined in the Natural Environment Assessment Report and Geology and Hydrogeology Assessment Report prepared by GHD in March 2024.

5.2.3 Net Effects

There are no net negative environmental effects anticipated with respect to Land Use associated with the operation of the proposed landfill expansion.

Potential negative environmental effects during construction related to dust, odour, noise, and traffic will be mitigated through the use of best management practices.

5.3 Socio-Economic Net Effects

This Section provides an assessment of the potential negative environmental effects for those Socio-Economic criteria which might be affected by the project (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Area(s) would change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2**, a “Yes” was applied to the following Socio-Economic Criteria:

Socio-Economic				
	Criterion	YES	NO	Additional Information
6.2	Result in aesthetics impacts (e.g., visual and litter impacts)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause aesthetic impacts due to the increase in landfill height in the expansion area.
6.8	Cause negative effects related to traffic?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects related to traffic through prolonging the life of the Site.
6.9	Be located within 8 km of an aerodrome/airport reference point?	X		Three aerodromes have been identified within 8km of the Site: – Cayuga (Bruce Field), approximately 1.3 km south of the Site – Cayuga East, approximately 3 km southeast of the Site – Grand River Executive, approximately 7.5 km north of the Site

5.3.1 Potential Effects on Socio-Economic Environment

As identified in **Section 2**, there are no potential effects anticipated to neighborhood or community character as the Site of the proposed expansion is located within an area currently zoned as Disposal Industrial. No negative effects on local businesses, institutions, or public facilities are anticipated. There will be no negative impacts on recreation,

cottaging, and tourism as no such land uses have been identified in the SSA and LSA. There will be no increase in the demand for community services and/or infrastructure as a result of the proposed expansion and no change in the economic base of the surrounding community, local employment, or labour supply.

The proposed undertaking is a horizontal and vertical expansion of the existing landfill which will cause an increase in the landfill height and may cause negative visual and aesthetic impact in the absence of mitigation measures. However, this will not exceed currently approved peak contours and can be mitigated.

The results of the Traffic Assessment Report conducted as part of this Environmental Screening Process concluded that the truck traffic associated with the proposed capacity expansion will not contribute any additional traffic within the study area due to maintaining the maximum approved fill rates. With no additional traffic being generated by the Site, minimal impact is expected on traffic safety and traffic operations. No potential road improvements are required or recommended.

Three local airfields, Cayuga (Bruce Field) Airport, Cayuga East Airport, and Grand River Executive (York) Airport, are located within 8 km of the Site. However, the proposed expansion will not cause negative impacts to the airports and will not interfere with the flight paths as no tall structures, such as stacks, exist or are proposed at the Site.

5.3.2 Mitigation Measures

With no additional truck traffic generated by the proposed capacity expansion, no mitigation measures are recommended in order to avoid or minimize impacts on transportation.

There is a wire fence around the perimeter of the site. The western part of the existing Site located on Books Road has a visual berm which includes a chain link fence with visual screen as mitigation to visual impact, providing a visual barrier to passersby. The visual screen will be augmented in response to the increased landfill height as a visual and aesthetic mitigation measure.

5.3.3 Net Effects

The results of the Socio-Economic Assessment indicate that there will be a change to the current visual scenario as a result of the proposed expansion. However, this can be mitigated by increasing the height of the existing visual screen, vegetating the screening berm and/or introducing additional plantings on the Site. This would minimize views of the Site from surrounding areas.

6. Monitoring Requirements and Additional Approvals

6.1 Monitoring Requirements

There are no requirements for monitoring specifically related to land use or the socio-economic environment for the proposed landfill expansion.

6.2 Additional Approvals

The proposed expansion will require a permit from the GRCA. No other approvals are required for land use or the socio-economic environment for the proposed landfill expansion.

7. Conclusion

Application of the Screening Criteria Checklist identified the potential for negative effects related to traffic. The results of the Traffic Assessment Report conducted as part of this Environmental Screening Process concluded that the truck traffic associated with the proposed capacity expansion will not contribute any additional traffic within the study area due to maintaining the maximum approved fill rates. With no additional traffic being generated by the Site, there is an expected minimal impact on traffic safety, and traffic operations, and no potential road improvements are required or recommended. Therefore, there are no anticipated potential negative impacts on the socio-economic environment related to traffic.

Application of the Screening Criteria Checklist identified the potential for negative effects on the aesthetics in the absence of mitigation measures. An increase in the height of the existing fence is proposed to provide a visual barrier to the increased landfill height and it should be noted that the expansion will not exceed currently approved peak contours. Therefore, there are no anticipated potential negative impacts on the socio-economic environment related to aesthetics.

Application of the Screening Criteria Checklist identified that the Site is located within 8km of an aerodrome or airport reference point but will not interfere with flight paths as no tall structures exist or are proposed at the Site.

Application of the Screening Criteria Checklist identified that the Site may require the use of hazard lands such as GRCA regulated wetlands. Any potential impacts to these lands will be mitigated through the application of BMPs.

In conclusion, the results of the Land Use and Socio-Economic Assessment indicate that there are no net effects anticipated for land use or the socio-economic environment.

Appendix index

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown in Figure 1.1.

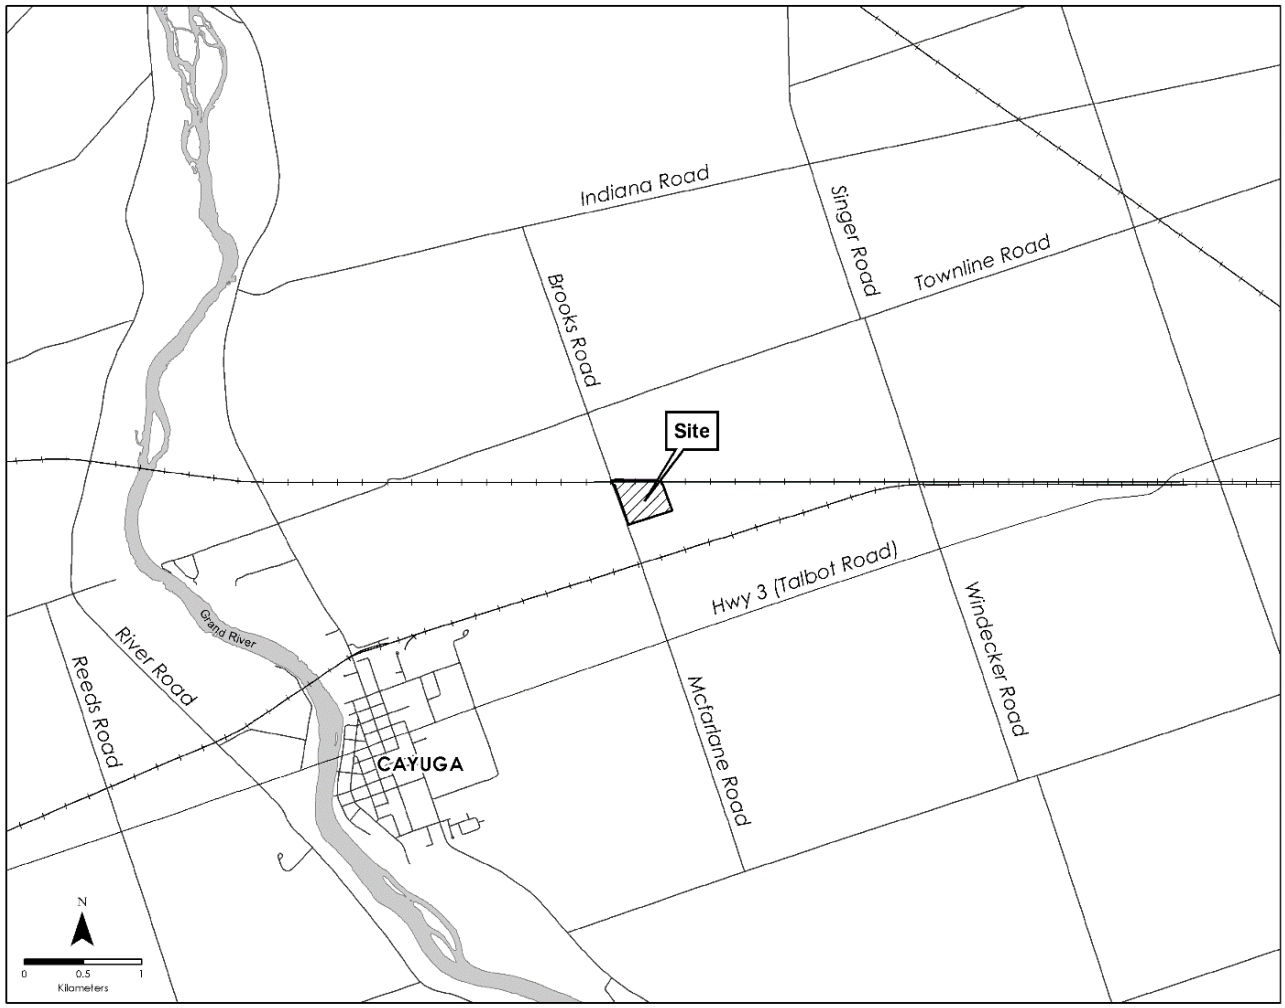

Figure 1.1 Location of the Proposed Undertaking

The Site, which operates under Environmental Compliance Approval (Landfill ECA) No. A110302, has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA) and industrial sewage works ECA No. 1122-BKUPSM (Industrial Sewage ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road

Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151, 000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customers for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by approximately 219,400 m^3, adding capacity equal to approximately two additional years. This expansion would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown in Figure 1.2.

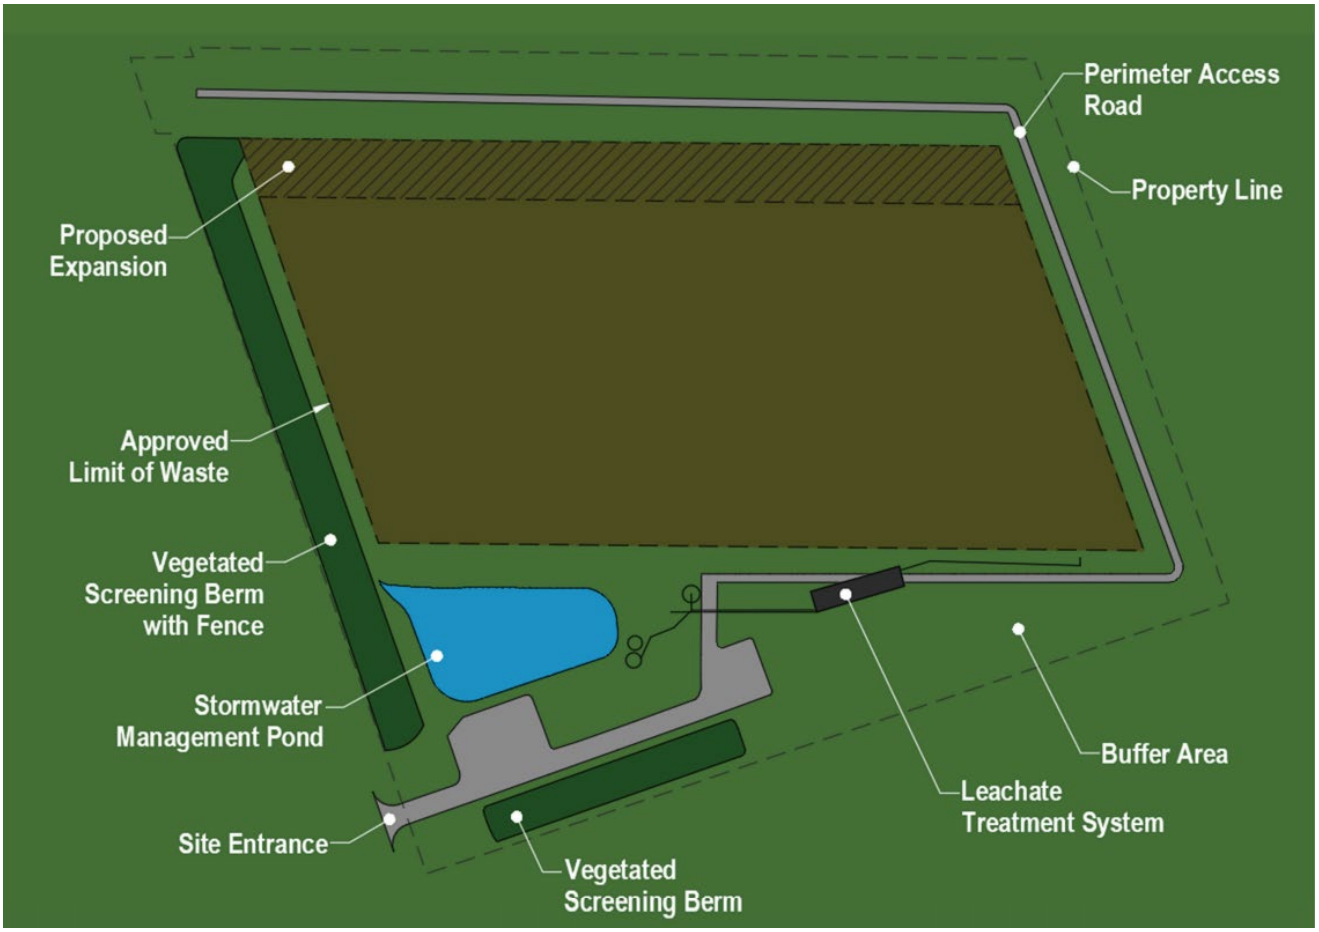

Figure 1.2 Proposed Capacity Expansion Concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by approximately 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

> *A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:*
>
> 1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
> 2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
> 3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process, an application will be made to amend the existing ECA No. A110302.

GHD has prepared an Air Quality and Odour Assessment on behalf of BRE for the proposed undertaking. This report documents the following as it relates to Air Quality and Odour:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project)
– Potential effects on the environment, mitigation measures, and net effects
– Future monitoring requirements to be implemented

The Study Areas reviewed for the Air Quality and Odour assessment were as follows (see **Figure 1.3**):

– **Site Study Area (SSA)** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– **Local Study Area (LSA)** – the area within the vicinity of the Site extending approximately 1 kilometre (km) in all directions from the Site Study Area boundaries.

Figure 1.3 Air Quality and Odour Study Areas

2. Screening Criteria Checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act.*

As noted in the Guide:

"*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required. Where a "yes' has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion*."

Each criterion is based on a question which is prefaced with the phrase, "*Might the Project*…" Table 2.1 was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Air Quality and Odour discipline. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in Section 4 of this report.

Table 2.1 Screening Criteria Checklist – Air Quality and Odour

	Criterion	YES	NO	Additional Information
	Might the project…			
3. Air and Noise				
3.1	Cause negative effects on air quality due to emissions (for parameters such as temperature, thermal treatment exhaust flue gas volume, nitrogen dioxide, sulphur dioxide, residual oxygen, opacity, hydrogen chloride, suspended particulates, or other contaminants)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on air quality due to emissions.
3.2	Cause negative effects from the emission of greenhouse gases (e.g., carbon dioxide, carbon monoxide, methane)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in emission of greenhouse gases associated with continued operation of the Site.
3.3	Cause negative effects from the emission of dust or odour?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in dust and odour emissions associated with continued operation of the Site.

3. Existing Conditions

The following subsections describe the existing conditions that are found within the On-Site and Site Vicinity Study Areas of the proposed project.

3.1 Methodology

3.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Air Quality and Odour Study Team to determine existing Air Quality and Odour conditions within the Study Area(s). The following sources of secondary information were collected and reviewed:

- Environment Canada Climate data (2017 to 2021).
- Ambient air quality data obtained from the Hamilton Air Monitoring Network (HAMN) (2019 to 2021). Note that the $PM_{2.5}$ data available from the closest monitoring station #29102 at Hamilton was used in the net effects assessment for a cumulative particulate evaluation.
- Existing Facility Emission Summary and Dispersion Modelling Report, prepared for Brooks Road Environmental by Conestoga-Rovers & Associates (September 14, 2015 and updated September 2022).
- Odour Monitoring Program, prepared for Brooks Road Environmental by Conestoga-Rovers & Associates (July 28, 2014).
- Odour Monitoring Program, prepared for Brooks Road Environmental by Conestoga-Rovers & Associates (November 3, 2014).
- Odour Monitoring Program, prepared for Brooks Road Environmental by GHD (2016,2017, 2019 and 2022).

3.1.2 Process Undertaken

On-site and off-site odour investigations were completed by GHD in 2014, 2016, 2017, 2019 and 2022. These studies indicated that there was no measurable odour off-site. GHD completed odour measurements during daytime and night-time periods to try and observe odours in the surrounding community. During all the odour monitoring events, no odours that could be attributed to the Site were detected off-site.

The GHD Team completed a walk-through of the Site, with focused observations at the location of the proposed horizontal expansion to the north and the leachate system. GHD did not identify any fugitive emissions during the walkthrough other than minor particulate emissions generated by small vehicles moving throughout the landfill. The GHD Team also observed the area surrounding the Site to confirm the locations of the nearest sensitive receptors to the Facility.

3.2 Description of Existing Conditions

The following conditions are currently present at the Site, as described in Table 3.1.

Table 3.1 Existing Conditions Relevant to Air Quality and Odour

Attribute	Existing Landfill
General Description	Expanding the current capacity by 219,400 m^3
Footprint Area (ha)	6.07
Peak Elevation – top of waste (mAMSL)	220.75
Maximum Daily Truck Traffic	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day

3.3 Climate, Air Quality and Odour

3.3.1 Hamilton Climate Station

The Hamilton Climate Station is a weather station located at Hamilton's John C. Munro International Airport (43.1N, 79.5W, elevation 237.7 m). The station has been operating since January 15, 1970 under World Meteorological Organization (WMO) ID 71263. The Hamilton Climate Station was selected as it is the closest representative station to the Site that has hourly documented climate data since 2010. Data from this station is published online at Environment Canada's National Climate Data and Information Archive. Hourly data from the station was analyzed to determine prevalent atmospheric conditions that are considered representative of the Site.

Figure 3.1 presents a five-year wind rose for the Hamilton Climate Station for the period between 2017 and 2021 and Figure 3.2 presents the wind class frequency distribution. The dominant wind directions, as shown on Figure 3.1, are from the southwest, and northeast.

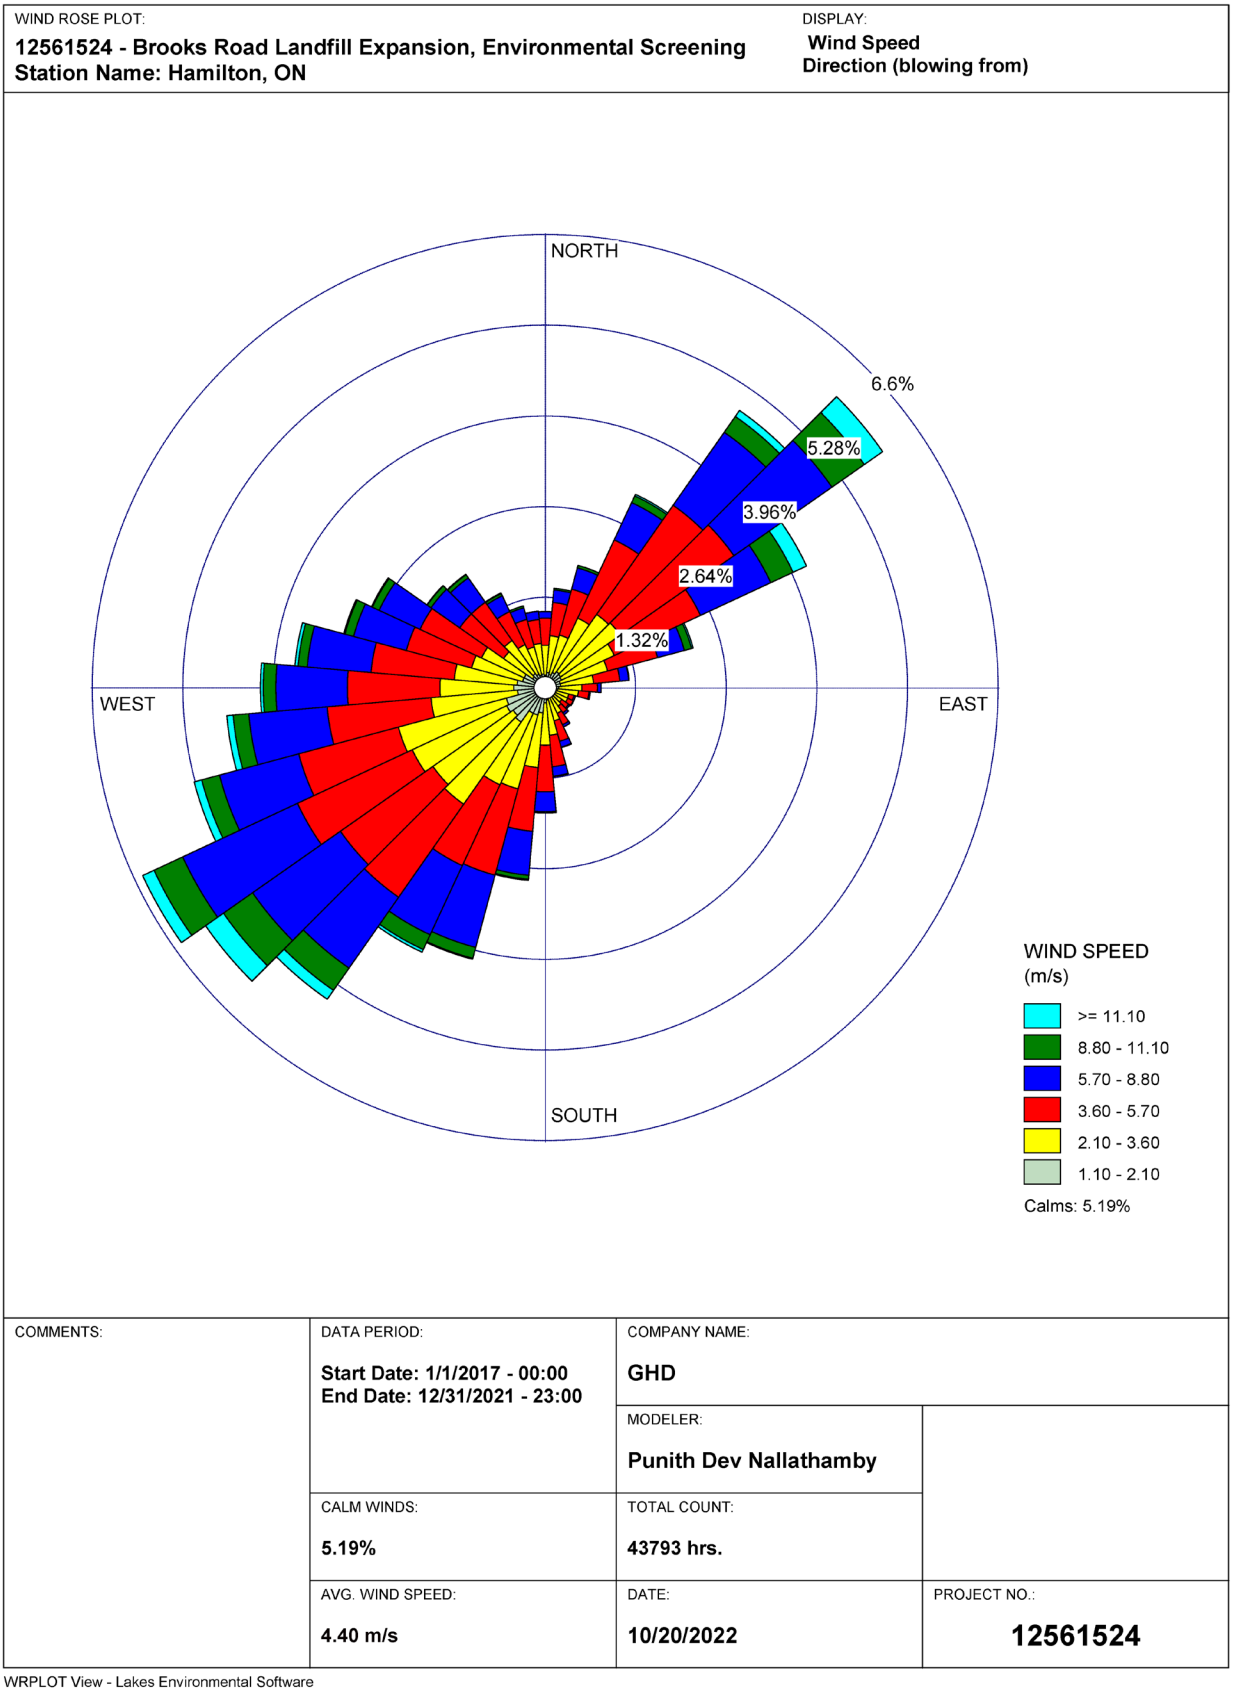

Figure 3.1 Wind Rose, Hamilton AP (2017 – 2021)

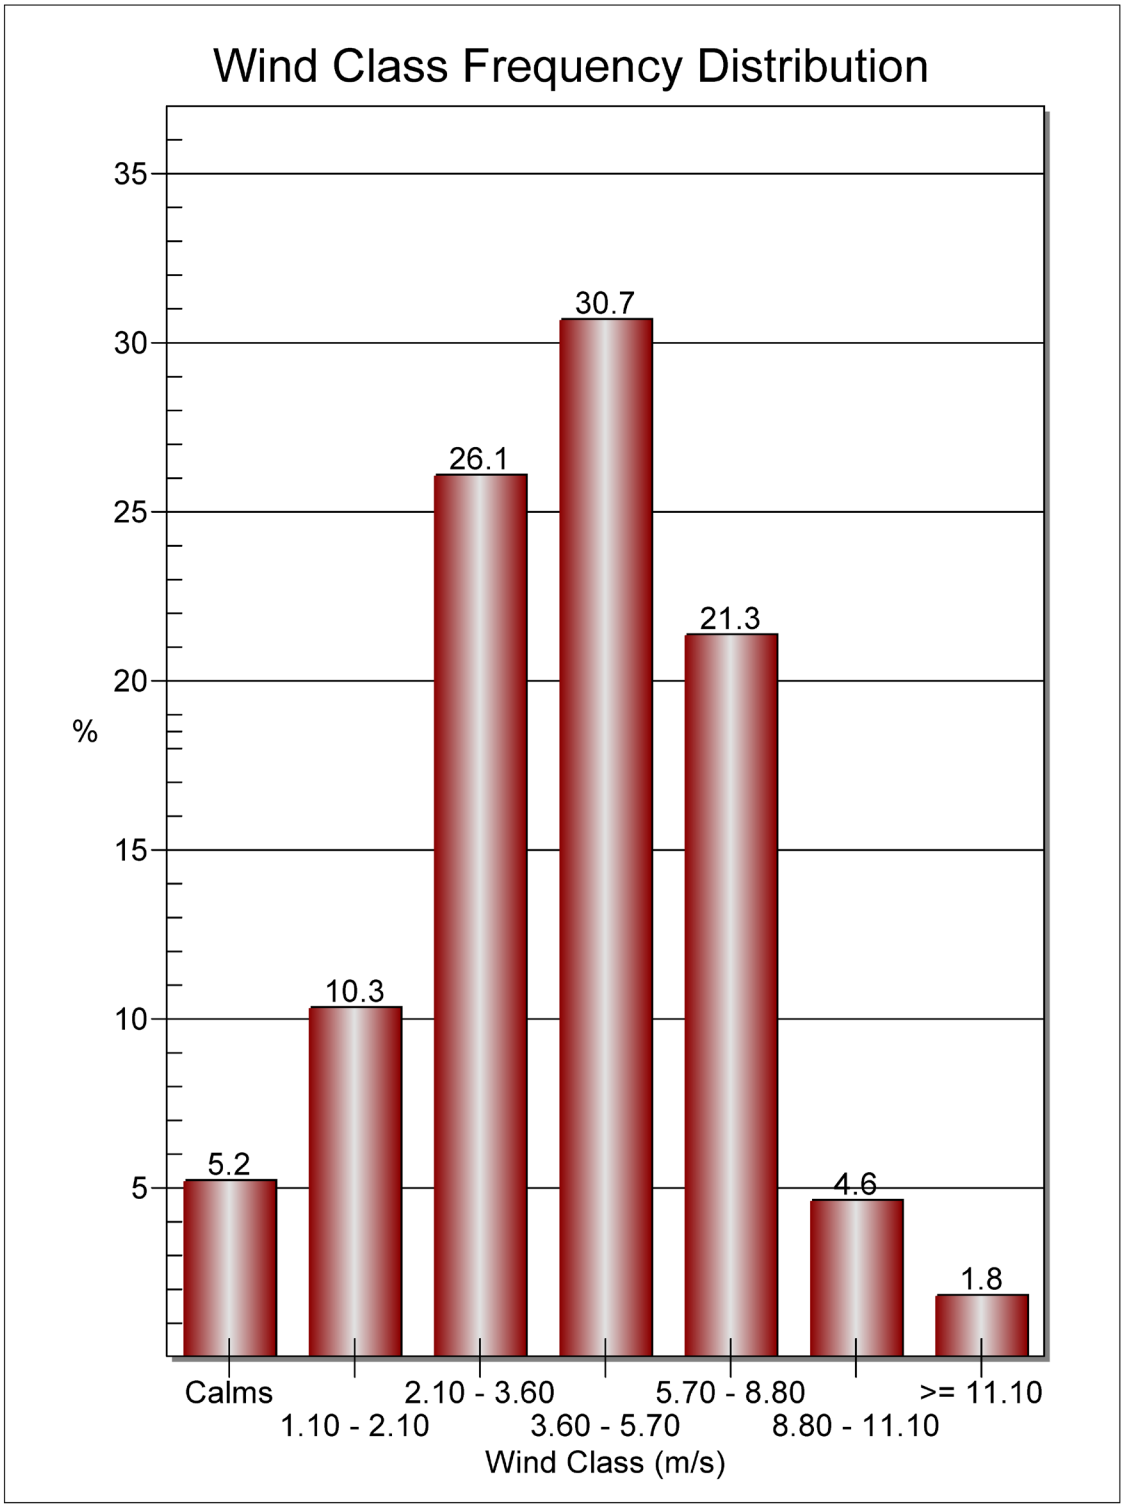

Figure 3.2 *Wind Class Frequency Distribution*

3.3.2 Air Quality

The Site is located approximately 2.8 km northeast of Cayuga and 25 km south of Hamilton and is surrounded by agricultural land. The closest receptor (as per the August 2024 Odour Management Plan) is approximately 223 m from the Site and there are no major industrial sources within the Study Area. The Site has a berm that runs along the west side of the Site and a clay stockpile located along the north side that reduces the line of sight and fugitive particulate matter emissions when the Site is in operation.

3.3.2.1 Vehicle Emissions

Particulate emissions related to vehicles operating at the landfill are the primary emissions of concern at the Site. Particulate may be defined in various particle size categories; including total suspended particulate (TSP), particulate less than 10 microns (PM_{10}) and particulate less than 2.5 microns ($PM_{2.5}$). All fractions of particulate were previously assessed for the potential landfill emissions. There is no change in the TSP, PM_{10}, or $PM_{2.5}$ emissions from the previous assessment as the proposed operations were assessed and fugitive dust management plans implemented.

3.3.2.2 Indicator Compounds

As identified above, TSP, PM_{10}, and $PM_{2.5}$ were previously included in the assessment as they are the primary emissions of concern at the landfill. Potential TSP, PM_{10}, and $PM_{2.5}$ emissions from vehicle exhaust and break and tire wear for the on-Site vehicles was concluded to be insignificant based on results from previous assessments and were not included in this assessment.

Other tailpipe/combustion emissions, such as nitrogen oxides (NO_x) and carbon monoxide (CO), can also be concluded to be insignificant based on the small volume of daily traffic at the landfill, and the significant distances to sensitive receptors. The potential concentrations of NOx and CO that a person might be expected to be exposed to near a municipal road would far exceed the concentrations of these compounds at the landfill boundary. Therefore, it may be concluded that NO_x and CO emissions from the vehicles at the landfill continue to be insignificant contributors to the background concentrations of these compounds as the traffic volumes have remained the same.

Landfill gases, such as hydrogen sulfide (H2S) and vinyl chloride, can also be concluded to be insignificant based on the operations at the landfill. GHD completed a theoretical landfill gas generation rate for the Site. Based on the existing and proposed waste to be disposed at the Site, it was determined that the maximum amount of landfill gas that will be generated is less than approximately 200 cubic feet per minute (in 2026). This would be distributed over an area of approximately 7.09 hectares or 70,900 square metres, resulting in a landfill gas exit velocity of only 0.00007 metre per second. This amount of landfill gas generation is anticipated to be insignificant from an overall Site profile and therefore landfill gases are not included in any further assessment.

Odours from the operations have not been further assessed. Due to the nature of the material being landfilled and the previous assessment that evaluated the proposed conditions there is no change in the odour profile for the Site.

3.3.2.3 MECP Air Monitoring Data

The MECP has ambient air monitoring stations across Ontario that measure a variety of pollutant concentrations. Typically, the stations monitor criteria air contaminants, such as nitrogen oxides, carbon monoxide, sulphur dioxide, and particulate matter, with the exception of some specialized monitors that measure speciated volatile organic compounds (VOCs) and Polycyclic Aromatic Hydrocarbons (PAH). There are no active monitoring stations within the Study Area, therefore, the monitor located in Hamilton (29102), Ontario was chosen as the closest monitor to the Site.

The Hamilton station monitors nitrogen oxides, ground-level ozone, and $PM_{2.5}$. The Hamilton station is located towards the north in Hamilton and is expected to be influenced by the industry within the City of Hamilton. The focus of this assessment is on the various size fractions of particulate matter. Although the Hamilton Station is not representative of the Site, the data from this location has been included for completeness. The focus of this assessment is on the TSP, PM_{10}, and $PM_{2.5}$. These fractions of particulate matter are the main containments that will be released at the Site.

Hourly readings and 24-hour average values are provided as part of the Hamilton air monitoring data set for $PM_{2.5}$. The Hamilton monitor is located in a predominantly urban area. Therefore, the $PM_{2.5}$ concentrations around the Site are expected to be much lower compared to the monitoring station.

As shown in Table 3.2, the concentration for $PM_{2.5}$ for the 24 hour averaging period is below its respective Canada Ambient Air Quality Standard (CAAQS). The Annual average of the monitoring data indicates $PM_{2.5}$ levels are slowly increasing over time. However, this is a result of an increase in industry in the vicinity of the Hamilton monitoring station and is not expected to be the trend for the Site and its surrounding area. Based on the monitored data, the $PM_{2.5}$ background concentrations in the vicinity of the Site are expected to be well below the CAAQS. It is expected that the levels at the Site are significantly lower as they are not influenced by the industrial and populated areas of Hamilton.

As part of BRE's continuing commitment to ensuring that particulate matter emissions from the Site are minimized from amended operations the standard operating procedure (SOP) will continue to be deployed. The purpose of the SOP is to ensure Best Management Practices (BPMs) are implemented at the Site to reduce the potential generation of particulate matter results. This includes, but is not limited to, the watering and sweeping of roads that equipment uses to travel the Site.

Table 3.2 $PM_{2.5}$ Concentration ($\mu g/m^3$) reported from the Hamilton Monitoring Station (STN29102)

	Monitoring Period					
Averaging Time	**2019**	**2020**	**2021**	**Average**	**CAAQS**	**Statistical Form**
24 hour	22.0	22.4	27.5	23.9	27	The 3-year average of the annual 98th percentile of the daily 24-hour average concentrations
Annual	9.1	10.1	10.7	10.0	8.8	The 3-year average of the annual average of the daily 24-hour average concentrations

3.3.3 Odour Quality

The Site has a functional leachate treatment facility to minimize the generation of odours at the Site. The most recent odour monitoring was completed by GHD at the Site in 2022 and also confirmed that the leachate treatment system has reduced the potential for odour impacts. Faint odours were detected throughout the Site during the most recent odour monitoring, however, no odour that would be attributed to the Site was detected at any off-Site monitoring locations.

In addition to the on-Site and off-Site odour monitoring that was completed by BRE, GHD completed a theoretical landfill gas generation rate for the Site. Based on the existing and proposed waste to be disposed at the Site, it was determined that the maximum amount of landfill gas that will be generated is less than 200 cubic feet per minute (in 2026). This would be distributed over an area of approximately 7.09 hectares or 70,900 square metres, resulting in a landfill gas exit velocity of only 0.00007 metre per second. This amount of landfill gas generation is anticipated to be insignificant from an overall odour Site profile.

As part of BRE's commitment to ensuring that odour complaints are minimized from the existing and proposed operations a standard operating procedure (SOP) was developed. The purpose of the SOP is to include odour mitigation measures that would be implemented to ensure that odour complaints are investigated and the condition that resulted in the odour complaint is mitigated.

4. Potential Effects, Mitigation Measures & Net Effects

A Project Description, which includes proposed engineering design figures, was prepared so that potential environmental effects and mitigation measures could be identified. The following subsections provide a general summary of the proposed undertaking.

4.1 Description of Project Components and Activities

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours, as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in Table 4.1.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted by 30 m. East and west ditches will extend to maintain full perimeter ditch.

Design Component	Existing Landfill	Proposed Capacity Expansion
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Methodology and Investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in Section 2 of this report.

4.2.1 Potential Odour Effects

Ontario does not have an odour standard. However, a value of one odour unit (OU) is sometimes used by the MECP as a limit for odour impacts at sensitive receptors such as residences. Based on the existing conditions odour studies, it has been shown that the frequency of exceedances of the odour levels at the nearest sensitive receptors will not exceed than 0.5% for any modelled year.

As discussed previously, the estimated landfill gas production for the Site is extremely small and is not expected to result in any off-Site odour impacts.

Additionally, GHD conducted numerous odour analyses in 2014, 2016, 2017, 2019 and 2022 and concluded that there were high on-Site odour levels near the leachate tank and the working face in the earlier studies but were lower in the 2019 studies after the installation of the leachate treatment system. Odours at the concentration currently observed at the Site typically do not result in complaints at off-Site sensitive receptor locations. This has been investigated through numerous odour monitoring programs that did not identify any on-Site odours being observed at off-Site locations.

Lastly, the Site currently implements several operational measures in order to reduce and/or mitigate odour impacts from the Site and will continue to implement these operational measures. These include:

– Continuing with the daily odour monitoring program carried out by the Site Operator.
– If odours are evident on the property boundary, increase the amount of daily cover applied on the waste.
– Minimize the active working face. Apply interim cover at a minimum thickness of 300 mm on areas of the landfill where landfilling has ceased for 6 months or more.
– Continue with the use of odour control granules for odour mitigation. Assess areas of placement and their effect on odour mitigation.

4.2.2 Potential Air Quality Effects

The air contaminant of concern for this Site is particulate matter. Other air contaminants are expected to be insignificant. As previously discussed, potential tailpipe and brake and tire wear emissions from vehicles operating at

the landfill are insignificant. Also, the estimated landfill gas production of only 200 cfm confirms that any potential off-Site impacts of compounds in the gas, such as methane, would be insignificant.

Particulate is primarily produced by vehicle traffic on the landfill roads. The particulate matter that is of concern is based on the re-suspension of particulate matter from traffic on the roads. The tailpipe and brake and tire wear has been determined to be insignificant sources of particulate matter. The Ontario ambient air quality criterion for TSP is 120 µg/m^3 on a 24-hour basis. There are other particulate provincial and federal criteria for PM_{10} and $PM_{2.5}$. These particulate emissions would also occur from vehicle traffic on the landfill roads.

It is GHD's experience that if one can show compliance with the TSP standard, a site with road traffic being the major source, then the PM_{10} and $PM_{2.5}$ concentrations will also be below criteria.

However, for completeness, GHD has modeled the TSP, PM_{10} and $PM_{2.5}$ emissions in the assessment of the alternatives.

The TSP, PM_{10} and $PM_{2.5}$ emissions from the on-Site roads were estimated based on truck traffic and emissions factors from the United States Environmental Protection Agency (USEPA).

Particulate off-site concentrations were estimated using the AERMOD air dispersion model which is an approved dispersion model under Ontario Regulation 419/05. The AERMOD model incorporates 5 years of meteorological data to determine the worst-case air concentration. Therefore, the modeling results can be considered to be conservative.

The on-Site haul roads were previously modelled for 50 trucks per day. This is the same amount of daily trucks proposed in this amendment. The Site has paved the on-Site roadway from the Site entrance to the landfill as was identified in the previous study.

TSP, PM_{10} and $PM_{2.5}$ from the Site were previously evaluated at the property boundary and all residential dwellings. The predicted worst case particulate impact at the property boundary is as follows:

– TSP – 50 trucks per day - 122.4 µg/m^3
– PM10 – 50 trucks per day – 64.18 µg/m^3
– PM2.5 – 50 trucks per day – 8.8 µg/m^3

The predicted maximum worst case particulate impact at the sensitive receptors is as follows:

– TSP – 50 trucks per day – 5.78 µg/m^3
– PM10 – 50 trucks per day – 4.56 µg/m^3
– PM2.5 – 50 trucks per day – 0.61 µg/m^3

MECP AAQC for TSP is 120 µg/m^3, 50 µg/m^3 for PM_{10}, and 27 µg/m^3 for $PM_{2.5}$. The modelled concentration at the sensitive receptors are well below the MECP AAQC for all particulate matter fractions. The modelled concentration at the property boundary is right at the AAQC for TSP and PM10 and the concentration of PM2.5 remains well below the MECP AAQC. There have been no changes to the modelled impacts from the previous application.

4.3 Air Quality & Odour Net Effects

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those Air Quality and Odour criteria which might be affected by the project as identified in Section 2. The effects assessment describes how existing environmental conditions in the Study Area(s) would change as a result of the construction and operation of the proposed undertaking.

As described in Section 2, a "Yes" was applied to the following Air Quality and Odour criteria:

– Cause negative effects on air quality due to emissions (for parameters such as temperature, thermal treatment exhaust flue gas volume, nitrogen dioxide, sulphur dioxide, residual oxygen, opacity, hydrogen chloride, suspended particulates, or other contaminants)?

– Cause negative effects from the emission of greenhouse gases (e.g., carbon dioxide, carbon monoxide, methane)?
– Cause negative effects from the emission of dust or odour?

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.3.1 Potential Effects on Air Quality and Odour

As previously mentioned, the previous application was completed assuming the proposed parameters and there are no changes to the Air Quality and Odour Environment.

4.3.2 Mitigation Measures

The Site has completed numerous mitigation measures since the previous application such as the introduction of SOPs for odour and dust and operation of a leachate treatment system. The Air Quality and Odour were assessed for the proposed conditions in the previous assessment and the identified mitigation measures were implemented. The Site is committed to continuing the mitigation measures.

4.3.3 Net Effects

No change to the net effects from the existing landfill operation are anticipated as a result of the proposed capacity change, based on the continued implementation of the mitigation measures.

5. Monitoring Requirements and Additional Approvals

To ensure that the mitigation measures identified in **Section 4.0** are implemented as envisioned, a strategy and schedule was developed for monitoring environmental effects. With these mitigation measures and monitoring requirements in mind, commitments have also been proposed for ensuring that they are carried out as part of the construction, operation, and maintenance of the proposed undertaking.

5.1 Monitoring Requirements

There are no additional monitoring requirements at this time.

6. Conclusion

There has not been a change in the Air Quality or Odour environment since the previous amendment. The previous amendment was assessed based on the proposed conditions in this amendment. The previous assessment showed that the concentrations of TSP, PM_{10} and $PM_{2.5}$ were all well below the AAQC at the sensitive receptors and will continue to be so with the proposed amendment. The cumulative effect for $PM_{2.5}$ was below the $PM_{2.5}$ AAQC at the sensitive receptors as well. The Site has implemented the control measures that were identified in the previous

assessment and will continue with these controls to minimize the Air Quality and Odour impacts from the Site operations.

The Site previously completed an Odour Management Plan based on the proposed conditions and sources. The proposed capacity expansion is not expected to change the odour profile of the Site or the management of odour. The Site will continue to strive for zero odour complaints from the Site operations. The Odour Management Plan will be updated and submitted as part of the ECA process.

The change in the predicted gas generation rate for the Site is negligible compared to previous assessments and is not expected to have an impact on the air emissions from the site. The Site is in the process of updating the Emission Summary and Dispersion Modelling (ESDM) Report for this negligible change for submission and review by the Ministry of Environment, Conservation, and Parks (MECP) as part of the ECA process.

Version Control History

Date	Description of Changes	Author/Reviewer Initials
September 2022	Original Document	PN/MG
October 2023	Updated gas volumes	AC/MG
March 2024	Updated gas volumes	MG/DB

1. Introduction

GHD was retained by Brooks Road Environmental (BRE) to prepare an Odour Management Plan (OMP) for the Brooks Road Landfill Site (Site) located in Cayuga, Ontario. The Site is located at 160 Brooks Road in Cayuga, Ontario approximately one kilometre north of Kings Highway No. 3 (Talbot Road). A Site location plan is provided as Figure 1. The Site operates under Waste amended Environmental Compliance Approval (ECA) number A110302 (Waste ECA), Industrial Sewage amended ECA number 1122-BKUPSM (Industrial Sewage ECA), and Air ECA number 7323-C6EJUM (Air ECA).

The purpose of this OMP is for persons engaging in activities at the Site to be aware of all odorous sources at the Site, potential causes of odourous emissions and to implement best practices and procedures to minimize odours.

This report contains the following:

– A description of the Site infrastructure
– Approval requirements related to odour
– Potential on-Site sources and causes of odour
– An Emissions Summary and Dispersion Model (ESDM) for the Site
– Inspection, maintenance and monitoring procedures
– Mitigation measures
– Contingency measures
– Complaint response procedures
– Training
– Recording keeping
– Landfill gas mitigation plan

As required, this document will be reviewed on an annual basis in accordance with ECA A110302 and updated as necessary to reflect applicable changes.

1.1 Change Log

The following changes were made in the October 2023 document:

– Updated based Stage 9 and 219,400 m^3 of additional airspace for a total landfill capacity of 1,264,465 m^3 and associated revisions to the ESDM in Appendix A.

1.2 Scope and Limitations

Accessibility of documents

If this report is required to be accessible in any other format, this can be provided by GHD upon request and at an additional cost if necessary.

2. Facility Description

The Site operates as a landfill. The total Site area is 14.3 hectares (ha) (35.3 acres) of which 6 ha (15 acres) is approved for landfilling. The Site is bounded to the north by a rural property consisting of undeveloped fields (i.e., long-term inactive agricultural crop production lands) and forested areas. To the south and east of the Site is undeveloped rural property consisting of a combination of fields and forested areas. The Site is bounded to the west by Brooks Road. On the west side of Brooks Road is an undeveloped rural property which is characterized primarily by undeveloped fields with occasional bush lots.

The Site has an approved fill rate of up to 1,000 tonnes per day, with a proposed maximum of 250,000 tonnes per year and a capacity of 1,264,465 cubic metres (m^3) (including waste and daily cover). The Site is approved to accept solid non-hazardous Industrial, Commercial, and Institutional (ICI) waste, including contaminated soils and processed organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant), generated from within the geographic boundaries of the Province of Ontario. Waste is brought to the Site by truck, inspected and weighed at the weigh scale located in the Site entrance, and then transported to the active tip face for disposal. The active tip face location varies over time as the landfill is filled. All exposed waste is covered by daily cover at the end of the work day. Any areas of the landfill where waste will not be placed for a period of 6 months or more is covered by a layer of interim cover a minimum of 300 mm thick. As the landfill reaches final waste contours, it will be progressively closed by installing final cover, which consists of 600 mm of compacted clay and 150 mm of topsoil.

The Site operates a leachate treatment system (LTS) that treats leachate generated in the landfill. Leachate is collected in the leachate collection system (LCS) and conveyed to a sump in the southeast corner of the landfill. From the sump, it is pumped to the LTS. The LTS consists of a treatment system and an effluent discharge system. The treatment system consists of a primary settling tank located adjacent to the landfill sump, an aeration system including two, below-grade, concrete tanks and a dissolved air flotation (DAF) unit, a membrane biofiltration reactor (MBR), ultraviolet (UV) disinfection, a sludge storage tank, and chemical feed systems. The treatment system has a rated capacity of 200 m^3/day. The effluent discharge system consists of an effluent transfer tank, three effluent discharge holding tanks, and discharge piping from the effluent discharge holding tanks to the Brooks Road roadside ditch. The discharge to the Brooks Road roadside ditch has a rated capacity of 45 m^3/day on average and 60 m^3/day at peak and discharges continuously. Treated effluent from the treatment system generated in excess of the rated capacity of the discharge to the roadside ditch is stored in the effluent discharge holding tanks prior to removal from the Site by tanker trucks to a licensed facility.

3. Approval Requirements

3.1 Environmental Compliance Approval

The Site is required to prepare an OMP based on Condition 3(1) outlined in the Site's Air ECA. This OMP is subject to an annual review and to be included in the annual report in accordance with Condition 12(7)(e) of the Site's Waste ECA.

The OMP details the method of monitoring Site-originating fugitive odours, provides mitigation measures to prevent nuisance odour complaints, provides contingency measures to address potential ongoing odour issues, and the respective scenarios in which the contingency measures are to be implemented. These monitoring methods,

mitigation measures, and contingency measures are provided to detail the efforts to be taken in accordance with Conditions 2(2), 2(3), and 2(4) of the Air ECA.

4. Potential Odour Sources

The sources identified below are considered the main sources of potential odour at the landfill. The potential causes of odour impacts for each source are also discussed below. Mitigation measures are discussed in Section 7.0 of this report. The location of the potential odour sources are provided in Figure 2. The sensitive receptors that were included in the ESDM Report are provided in Figure 3.

4.1 Waste Receiving

The Site receives non-hazardous ICI waste including contaminated soils and process organic waste (e.g. de-watered sewage sludge from the Caledonia Sewage Treatment Plant). The waste material is transported to Site using trucks. The Site can currently receive a maximum of 1,000 tonnes of waste per day.

Waste receiving may generate odour through the queuing of trucks transporting waste to the Site.

The potential for odours during waste receiving activities depend on:

– Queue time for waste transport trucks
– Characteristics and/or composition of the waste material
– Truck cover or container type
– Weather conditions including wind direction, temperature, precipitation, and relative humidity

Odour prevention measures to reduce the likelihood of odour emissions from waste receiving operations include:

– Ensure all trucks bringing waste to the Site maintain tarps and keep contents enclosed until they reach the active face.
– Schedule arrival of waste trucks such that trucks do not need to queue at the entrance while waiting to be inspected and weighed.
– Once a truck has completed tipping, close or tarp the truck prior to leaving the active face.

4.2 Landfill Working Face

Trucks transporting waste to the Site complete an incoming weigh-in and then travel to the landfill working face to unload. Heavy equipment, including excavators and landfill dozers/compactors handle the waste and compact it within the working face. At the end of the day, the working face is covered by daily cover in accordance with Condition 3(24a). This daily cover may consist of soil, compost, wood chips, or other approved daily cover.

The potential for odours during landfilling activities depend on:

– The footprint size of the active face
– The location of the active face
– The location of previously-placed, odour-generating waste
– Characteristics and/or composition of the waste
– Type and amount of daily cover used to cover the working face
– Weather conditions including wind direction, temperature, precipitation, and relative humidity

Odour prevention measures to reduce the likelihood of odour emissions from the landfill working face include:

– If any particularly odourous waste arrives on Site, ensure that it is covered immediately after placement and/or consider placement in a location furthest from the receptors noted on Figure 3. Place in a location and depth so as to prevent accumulation of water that could increase the landfill gas generation from this waste. All waste has the potential to generate odour but waste that may be particularly odourous include but are not limited to:
  - Waste with organics
  - Processed organic waste (dewatered sewage sludge from the Caledonia Sewage Treatment Plant)
  - Waste that is high in sulphur content
– If waste from a particular source or of a particular composition is identified to be odourous, Site staff will make note of when this material is being delivered to the Site and the weigh scale attendant will notify the landfill attendant to plan for appropriate placement of the material.
– Apply daily cover at the end of each working day.
– Keep the active face as small as reasonable for operations.

4.3 Leachate Collection System and Leachate Treatment System

Leachate is collected from the landfill by the LCS and conveyed through a primary settling tank, to the LTS for treatment and disposal. Treated effluent is stored in effluent holding tanks. Treated effluent is periodically loaded into tanker trucks for shipment to facilities licensed to accept the treated effluent. Leachate may occasionally be loaded into tanker trucks from the LCS or from temporary storage tanks. Potential odour generation from leachate management may include exposed locations of the LCS granular drainage blanket, the LCS cleanout or sump riser pipes, and LTS tanks.

The potential for odours from leachate collection and storage depends on:

– Volume of leachate stored in temporary tanks
– Weather conditions including wind direction, temperature, precipitation, and relative humidity

Odour prevention measures to reduce the likelihood of odour emissions from the leachate collection and treatment systems include:

– Reduce storage of leachate in tanks
– Keep all LCS cleanout pipes and riser pipes sealed with a blind flange
– Keep the granular drainage blanket of the LCS at the top of slope covered

4.4 Covered Portions of the Landfill

Covered portions of the landfill include areas completed with interim cover or final cover. Odour may originate from the emission of landfill gas from cracks, or seeps in interim or final cover.

The potential for odours from covered portions of the landfill depends on:

– Condition of the cover
– The location of previously-placed, odour-generating waste
– Weather conditions including wind direction, temperature, precipitation, and relative humidity

Odour prevention measures to reduce the likelihood of odour emissions from covered portions of the landfill include:

– Apply interim and final cover over portions of the landfill that are temporarily not to receive waste or are completed to final grades
– Maintain vegetation on final cover
– Inspect covered portions of the landfill quarterly

The above potential odour sources were identified during the on-going operations. If other sources of odour are present the OMP will be updated to account for them.

5. Emissions Summary and Dispersion Modelling

GHD has prepared an ESDM Report attached as Appendix A. The ESDM Report was prepared in accordance with s.26 of Ontario Regulation (O. Reg.) 419/05 and considers potential sources of contaminants, including odour. Dispersion modeling was used to determine maximum potential Point of Impingement (POI) concentrations at potential receptors with all sources operating at maximum potential emission rates. The resulting POI concentrations are compared to criteria published in the MECP Air Contaminants Benchmarks (ACB) List: Standards, Guidelines, and Screening Levels for Assessing POI Concentrations of Air Contaminants. The ESDM Report indicates that the Site can operate in compliance with O. Reg. 419/05.

6. Inspection, Maintenance and Monitoring Procedures

Regular inspections allow Site operators to identify odours and initiate responsive actions to prevent the odours from having negative effects off-Site. Daily Site inspections are required per Condition 12 of the Waste ECA. The Site is inspected on a daily basis by shift supervisors and includes inspection for fugitive odours. A daily inspection ensures that potential issues are addressed immediately. All inspections should be documented in the Inspections Log, which is provided as Appendix B.

The entire Site will be inspected on a daily basis in accordance with Condition 12 of the Waste ECA and emphasis should be placed on the following areas of the Site, with respect to the potential for odour generation:

– Waste receiving area
– Landfill working faces
– Closed areas
– Leachate collection system, storage tanks

Other activities that should occur during the inspection include:

– Evaluate the waste receiving area and truck queue times to ensure that waste is landfilled in timely fashion.
– Evaluate the size of the working face. The size of the working face should not be oversized.
– Check that a daily cover is applied to the working face at the end of each working day.
– Evaluate the interim and final cover in closed/decommissioned areas of the landfill for cracks, fissures and/or erosion and evaluate the coverage and health of vegetation.

– Inspect the leachate collection system, storage tanks for exposed areas, leaks and spills.
– Determine and document weather conditions including wind speed, direction, humidity, precipitation, and temperature.

If an odour is confirmed to be coming from an on-Site source and can be detected at the property boundary, mitigation measures should be implemented and documented in the daily log. Subsequent daily inspections must include inspection of the source area and mitigation measures implemented to determine if effective odour prevention and control is being accomplished.

The Site Supervisor is responsible to ensure this OMP is followed by landfill operators.

7. Mitigation Measures

The following section lists mitigation measures to reduce the potential for fugitive odours to migrate to off-Site receptors. These mitigation measures are intended to be implemented within one working day in response to the detection of odour during daily inspections or in response to an odour complaint confirmed to be as a result of Site operations.

7.1 Waste Receiving

If odour is determined to be emanating from the waste receiving operations, such as the trucks entering the Site for inbound or outbound weighing, the following are potential mitigation measures to implement:

– Discuss with waste generators if efforts can be made to minimize odours from waste prior to coming to the Site.
– Investigate if trucks are removing tarps/covers prior to reaching the active face or failing to reinstate tarps/covers prior to leaving the active face and direct haulers to maintain covers in accordance with Section 4.1.

7.2 Landfill Working Face

If odour is determined to be emanating from the landfill working face, the following are potential mitigation measures to implement:

– Apply daily cover to portions of the working face to limit its size for the remainder of the day
– Apply additional daily cover material
– Apply odour control granules to the daily cover
– Operate the odour control misting system if climatic conditions are appropriate

7.3 Leachate Collection System and Storage Tank

If odour is determined to be emanating from the leachate collection system or storage tanks, the following are potential mitigation measures to implement:

– If an area of the leachate collection system granular drainage blanket is identified to be exposed, place cover material over the exposed area and apply odour control granules.
– If a blind flange is determined to have been removed from a leachate collection system cleanout or sump riser pipe, reinstall the blind flange(s).

– If any raw leachate is being temporarily stored in an above ground tank and odour is determined to be emanating from the tank, if applicable, drain the tank back to the landfill.
– If odour is determined to be coming from loading of a tanker truck with raw leachate and climatic conditions are appropriate, operate the odour control misting system. Consider if tanker loading can be postponed if climatic conditions are increasing the odour migration.

7.4 Covered Portions of Landfill

If odour is determined to be emanating from a covered portion of the Landfill, such as from a crack in interim or final cover, the following are potential mitigation measures to implement:

– Apply odour control granules to the crack.
– For interim cover, wet the area, scarify, apply additional cover soil, and compact the soil to repair erosion or cracking due to desiccation. Evaluate if additional repair work is necessary.
– For final cover, initiate a repair in accordance with the final cover repair contingency measure noted in Section 8.

8. Contingency Measures

Contingency measures represent actions that may be required if odour is confirmed to be coming from the Site and the implementation of preventative and mitigation measures described in Sections 4 and 7, respectively, are deemed to be ineffective. Contingency measures are intended to be actions that would take longer than a day to implement and may warrant additional investigation activities.

In accordance with Condition 2(3) of the Air ECA, if odour is not mitigated through implementation of mitigation measures, the MECP District Manager may provide written notice to conduct an investigation as to why the odour was not mitigated and assess the need for implementation of contingency measures.

To evaluate a mitigation measure, the area or practice identified to be contributing to the detected odour will be inspected as part of subsequent daily inspections. Where mitigation measures are implemented, the inspection will also include evaluation of the observed effectiveness. If the odour source is determined to continue to be resulting in off-Site impacts and the mitigation measures are observed to be ineffective, or if the MECP District Manager issues notification requiring the implementation of additional measures, then an investigation will be conducted per Condition 2(3) and include assessment of potentially effective contingency measures. Such an investigation will be provided to the MECP District Manager within the time frame identified in the notice pursuant to Condition 2(3).

Prior to implementation of contingency measures, the applicability of the proposed contingency measures will be assessed based on the confirmed source of odour. Potential contingency measures are identified in the sections below.

8.1 Application of Interim Cover

If an area of the landfill will not have waste placed for 6 months or more, interim cover should be applied.

Interim cover should be applied at a minimum thickness of 300 mm and should consist of low permeability soil in accordance with Condition 3(24) of the Waste ECA. Interim cover can be sourced from the on-Site clay stockpile. Heavy equipment including an excavator, rock trucks, a bulldozer, and a compactor would be required to move and place interim cover soil. The on-Site clay may require the addition of moisture if it is noted to be dry during placement.

Application of interim cover is expected to take approximately 4 weeks to implement and could take longer depending on the size of the targeted interim cover area.

8.2 Application of Final Cover

If an area of the Landfill has reached final waste grades as shown in the D&O Report, final cover may be applied.

Final cover consists of a minimum 600 mm thick low permeability soil with 150 mm of vegetated topsoil and must comply with Condition 3(24) of the Waste ECA. The additional thickness and use of a vegetated topsoil layer helps prevent desiccation of the cover, which may result in cracks that could release odour. On-Site clay may only be used for final cover if it can be tested to indicate a construction methodology that allows a minimum 150 mm of infiltration per year. Therefore, material may need to be sourced from off-Site. Topsoil would also require procurement. Heavy equipment including an excavator, rock trucks, a bulldozer, and a compactor would be required to install final cover.

Application of final cover is expected to take approximately 2 months to implement and could take longer depending on the size of the targeted final cover area.

8.3 Repair or Re-Vegetation of Cover

Interim or final cover may dry over time and begin to desiccate. This could lead to the development of cracks where odour can escape.

Cracks in interim or final cover can be repaired through:

– Removal of any vegetation and topsoil around the crack
– Application of moisture
– Scarification of the low permeability soil
– Placement of additional low permeability soil
– Compaction of the repaired area

If the repair is on final cover, the repaired area also requires the placement of 150 mm of topsoil and re-vegetation.

Areas of final cover observed to have poor vegetation are susceptible to crack development. If poor vegetation coverage is noted on final cover, the area can be re-vegetated through placement of additional topsoil and hydroseed.

Though not required for interim cover, if interim cover is observed to continually develop cracks, placement of topsoil and hydroseed can minimize this concern.

The implementation timeline for repair and revegetation of cover materials varies depending on the area requiring repair and may take between 2 weeks and 2 months.

8.4 Application of Odour Suppressing Material

If the active waste face is producing odour that can’t be mitigated through application of daily cover, reduction in size or odour control granules, additional odour suppressing material may be warranted. There are various landfill odour suppression materials available that include:

– Foams
– Sprays
– Biological covers

These materials may require bench-scale testing to determine appropriate usage. Application of odour suppressing material does not eliminate the requirements for application of cover materials in accordance with Condition 3(24) of the Waste ECA.

Odour suppressing materials will take approximately 3 weeks to source and up to 8 weeks to adjust formulation/application. Once conditions and materials have been determined, subsequent applications can be completed within 1-week.

8.5 Relocation of the Active Face

During the progressive landfilling at the Site, the active waste face will change locations frequently. The location of the active waste face and seasonal climatic conditions may result in an increased potential for odour generation and migration. If seasonal climatic conditions are determined to increase odour levels at the active waste face and the location is conducive to the potential for off-Site impacts, the active waste face may require relocation.

Relocating the active waste face may require removal of interim cover at another location and preparation of landfill access roads. Implementation of a relocated active waste face may take approximately 2 weeks. If the active waste face is relocated, daily cover must be maintained on the former active waste face. Interim cover application on the former active waste face may also be warranted, though not strictly required if landfilling will recommence in that area within 6 months.

8.6 Reduction in Incoming Waste Volumes

If the size of the active waste face is determined to be contributing to generation of odours and the waste face can not be reduced due to the volume of material to be managed in a day, the size of the active waste face may be reduced through rescheduling to reduce daily incoming waste volumes. If a portion of the incoming waste has a high odour potential, rescheduling waste shipments can reduce daily incoming rates of this waste.

Furthermore, receipt of odourous waste may be restricted.

Incoming waste rescheduling may take 2 weeks to achieve to work with generators and haulers to reschedule shipments.

8.7 Installation of Odour Control System on Piping or Tanks

If odour is determined to be coming from tank vents associated with the leachate collection and treatment systems under normal operating conditions, odour control may be required on the venting systems.

All tank vents are passive, in that there is no collection system. Therefore, if odour control on passive tank vents is considered necessary, a carbon filtration system may prove effective. Prior to implementation, the tank vent odour control system should be designed based on potential flow rates, odour-causing parameters, and connection details.

Installation of odour control systems on piping or tanks requires minor design effort and procurement, therefore implementation is expected to take approximately 2 months.

8.8 Surface Emissions Monitoring

If odour is determined to be emanating from the closed portions of the landfill and obvious cracks are not visible upon inspection, surface emissions monitoring may be conducted to identify “hot spots” where odour may be escaping from cover material. The identification of “hot spots” may be used in conjunction with other contingency measures to address the odour migration.

As there are no established guidelines in Canada for landfill surface emissions monitoring, the general intent of the surface emissions monitoring procedures outlined in the United States Environmental Protection Agency’s (US EPA’s) New Source Performance Standards (NSPS) Method 21 Guidelines per the Code of Federal Regulations (CFR) 40, Part 60, Subpart WWW would be used.

In general accordance with the NSPS Method 21 Guidelines, observed areas with methane concentration readings in exceedance of 500 ppm will require re-monitoring and/or cover repairs/re-monitoring to ensure the corrective actions have successfully mitigated the emissions.

Other surface scanning methods to identify areas of concern may be considered, including thermal imagery through the use of aerial imaging equipment.

9. Complaint Response Protocol

The Site is committed to minimizing odour generation, as much as possible. On occasion there may be complaints regarding odour from the Site. Site workers are be trained on facility protocol for handling and recording complaints. The Site has a Complaint Protocol prepared in May 2020 that may be revised occasionally. The Complaint Protocol outlines the procedures to be implemented in response to receipt of a complaint either through the MECP or directly to the Site. The source of odour resulting in a complaint is investigated when the complaint is received in a timely manner.

The Complaint Protocol also includes a complaint form to be filled out by Site staff. The complaint form will identify any mitigation measures or contingency measures taken as a result of the complaint. The Complaint Protocol is provided as Appendix C. Currently the closest source of weather condition information is the Environment Canada – Hamilton A station. This station will be used during complaint investigation as a consistent source of weather condition information. If another source of weather condition information becomes available, the OMP and the Complaint Protocol will be revised.

10. Training

All employees at the Site are required to receive training on the contents of this OMP. Refresher training for all employees is recommended on an annual basis. Training requirements for management and non-management staff are identified below.

The non-management training should include the following topics:

– Approval requirements
– Potential sources of odour at the Site
– Preventative measures outlined in Section 4
– How to report findings of potential odour sources
– Odour complaint response procedures

The management training should include the following topics:

– All topics covered under non-management training
– Site inspection requirements
– Implementation of mitigation measures
– Initiation of investigations requested by MECP District Manager
– Implementation of contingency measures
– Recordkeeping and annual reporting requirements

All employees who receive training need to fill out the Training Log. The Training Log is provided in Appendix D.

11. Record Keeping

The following records should be kept on Site:

– Daily Inspection Sheets
– Complaint Response Sheet
– Training Signature Page
– A copy of this OMP for review or inspection by the MECP

In addition, this OMP will be reviewed on an annual basis through the annual report prepared in accordance with the Waste ECA. Any recommended changes to this OMP require revision to the report and submission to the MECP District Manager.

12. Landfill Gas Mitigation Plan

Landfill gas (LFG) is produced by the biological decomposition of wastes placed in a landfill. LFG composition is highly variable and depends upon a number of Site-specific conditions including solid waste composition, density, moisture content, and age. The specific composition of LFG varies significantly from landfill to landfill and even from place to place within a single landfill. However, LFG is typically comprised of methane (approximately 50 percent by volume) and carbon dioxide (approximately 50 percent by volume). LFG may also contain nitrogen (N2), oxygen (O2), and trace quantities of other gases (such as hydrogen sulfide (H2S), mercaptans, etc.). In addition to the above methane-related LFG constituents, non-methane organic compounds (NMOCs) such as vinyl chloride, may also be generated and emitted at a landfill.

As noted in the D&O Report, Ontario Regulation (O. Reg.) 232/98 requires the mandatory collection of LFG for sites with a total waste disposal volume greater than 1.5 million m^3. Given that the total landfill capacity including Stage 9 will be approximately 1,264,465 m^3, LFG collection is not required as per O. Reg. 232/98. Also based on the significantly low estimated LFG production rates, a LFG collection and control system is not considered feasible for the Site.

However, the landfill does produce LFG, which is a potential source of odour. LFG generation is affected by the composition of waste and the physical, chemical, and biological properties of the waste mound. Factors that may increase LFG generation or the odour in landfill gas include:

– Moisture in the landfill
– Methane generation potential of waste

Leachate management will reduce LFG generation rate through limiting the moisture content of the waste. The leachate management plan for the Site is described in the D&O, the Waste ECA, and the Leachate Removal Plan (LRP). The D&O describes the methodology of minimizing leachate generation through progressive closure and installation of interim and final cover to separate surface water from waste. The LRP describes the methods to reduce the leachate volume within the landfill to an average depth measured on the base liner of 0.3 m over a five-year period prior to landfill closure. The implementation of the leachate management plan serves to reduce the moisture content within the waste and reduce LFG generation. Compliance with the LRP is evaluated annually within the annual report required by the Waste ECA.

The LFG production assessment contained in the D&O report identified a waste composition based on data from 2009 through 2020. The assumed waste composition is provided below:

Table 1 Assumed Waste Composition by Type

Waste Type	Percent of Total	Waste Description	Total LFG Generated (tonnes per year)
Bulk Waste	5.7	Residential Rolloffs	2,856
C&D Waste	27.3	C&D from transfer stations, contractor demolition wastes, roofing/shingles	13,768
Sewage Sludge	0	Dewatered sludge from sewage treatment facilities	0
Garden Waste	0.6	Leaf and yard waste	313
Food Waste	1.9	Organics	952
Inert Waste	64.6	Glass, contaminated soil, ash	32,594

Mitigation measures to reduce LFG generation include continued compliance with ongoing leachate management activities, and alteration to the waste composition brought to the Site. To measure the results of LFG mitigation measures the following is proposed:

1. Identify compliance status with LRP.
2. Compare annual waste composition to modeled waste composition in Table 1 and identify reduction in LFG generation potential of actual waste composition compared to modeled waste composition.
3. Include findings from 1 and 2 in Annual Report.

Executive Summary

This Emission Summary and Dispersion Modelling (ESDM) Report was prepared to assist Brooks Road Environmental c/o 2270386 Ontario Limited (BRE) in evaluating the inclusion of Stage 9 at the Site for compliance with Ontario Regulation (O. Reg.) 419/05 and to support the Odour Management Plan. Stage 9 is estimated to yield 219,400 m^3 of additional space for a total landfill capacity of 1,264,465 m^3.

The ESDM Report was prepared in accordance with s.26 of O. Reg. 419/05. In addition, guidance in the Ministry of Environment, Conservation and Parks (MECP) publication "Procedure for Preparing an Emission Summary and Dispersion Modelling Report" dated March 2018 (ESDM Procedure Document) was followed as appropriate.

The Site is currently covered under Amended Environmental Compliance Approval (ECA) (Air) No. 7323-C6EJUM, issued on September 24, 2021. A copy of the existing ECA (Air) is provided in Appendix A.

BRE owns and operates a landfill at 160 Brooks Road in Cayuga, Ontario (Site). The NAICS code that applies to this Facility is 562210 – Waste Treatment and Disposal. The Facility is subject to s.20 of O. Reg. 419/05, and the modelled impact of contaminant emissions must be assessed using a Ministry approved dispersion model for each contaminant and applicable averaging period.

The Site is expected to emit Volatile Organic Compounds (VOCs) and odour. Some of the sources and contaminants were considered negligible in accordance with s.8 of O. Reg. 419/05.

The maximum point-of-impingement (POI) concentrations were calculated based on the operating conditions where all significant sources are operating simultaneously at their individual maximum rates of production. The maximum emission rates for each significant contaminant emitted from the significant sources were calculated in accordance with s.11 of O. Reg. 419/05 and the data quality assessment follows the process outlined in the requirements of the ESDM Procedure Document.

A POI concentration for each significant contaminant emitted from the Site was calculated based on the calculated emission rates and the output from the approved dispersion model; the results are presented in the Emission Summary Table in accordance with s.26 of O. Reg. 419/05.

The POI concentrations listed in the Emission Summary Tables were compared against criteria listed in the MECP publication "Air Contaminants Benchmarks (ACB) List: Standards, Guidelines, and Screening Levels for Assessing POI Concentrations of Air Contaminants".

All of the predicted POI concentrations for contaminants listed in the Emission Summary Table that are included in the MECP's ACB List, are below the corresponding limits.

This ESDM Report demonstrates that the Facility can operate in compliance with O. Reg. 419/05.

Contents

Figure index

Table index

Appendices

1. Introduction and Site Description

This Emission Summary and Dispersion Modelling (ESDM) Report was prepared in accordance with s.26 of Ontario Regulation (O. Reg.) 419/05. In addition, guidance in the Ministry publication "Procedure for Preparing an Emission Summary and Dispersion Modelling Report" dated March 2018 (ESDM Procedure Document) PIBS 3614e04.1 was followed as appropriate.

For ease of review and to promote clarity this ESDM Report is structured to correspond to each of the items listed in the Ministry publication "Emission Summary and Dispersion Modelling Check-List" PIBS 5357e (2021).

This section provides a description of the Site as required by subparagraph 1 of s.26 (1) of O. Reg. 419/05.

1.1 Purpose and Scope of ESDM Report

This ESDM Report was prepared to evaluate the inclusion of Stage 9 at the Site and compliance with O. Reg. 419/05 and to support the Odour Management Plan. Stage 9 is estimated to yield 219,400 m^3 of additional airspace for a total landfill capacity of 1,264,465 m^3. The ESDM Report was prepared in accordance with s.26 of O. Reg. 419/05 and guidance provided in the Ontario Ministry of the Environment, Conservation and Parks (MECP) publication "Procedure for Preparing an Emission Summary and Dispersion Modelling Report, Version 4.1" dated March 2018 (ESDM Procedure Document) PIBS 3614e04 was followed as appropriate.

The Site is legally described as Part of Lot 24, Concession I-N.T.R., Haldimand County. The total Site area is approximately 14.3 hectares (ha) (35.3 acres) of which approximately 6 hectares (15 acres) is approved for landfilling.

The location of the Site is presented on Figure 1 and the land use designation of the Site and surrounding area is presented on Figure 2. The location of the property line is presented on Figure 3. The location of the discharges from each of the sources are also presented on Figure 3; the location of each of the sources is specified with the source reference number.

1.2 Description of Processes and NAICS Codes

The Site is currently operating as a landfill that has an approved maximum fill rate of 250,000 tonnes per year and a capacity of 1,264,465 cubic metres (m^3) (including waste and daily cover).

The North American Industry Classification System (NAICS) Code that applies to this Site is 562210 – Waste Treatment and Disposal.

1.3 Description of Products and Raw Materials

Brooks Road Landfill is approved to accept solid non-hazardous Industrial, Commercial and Institutional (ICI) waste, including contaminated soils and processed organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant), generated from within the geographic boundaries of the Province of Ontario.

A copy of the current ECA (Air) for the Site is included in Appendix A.

Process information is provided in greater detail in Appendix B – Sample Calculations. Refer to Table 1 - Sources and Contaminants Identification Table, which tabulates the individual sources of emissions at the Site.

1.4 Process Flow Diagram

Refer to Figure 4 – Process Flow Diagram for a graphical representation of the leachate management process at the Site.

1.5 Operating Schedule

The Site operates from 6:00 a.m. to 6:00 p.m., Monday to Friday and from 6:00 a.m. to 2:00 p.m. on Saturdays.

Waste receipt occurs from 7:00 a.m. to 5:00 p.m. Monday to Friday and from 7:00 a.m. to 1:00 p.m. on Saturdays.

1.6 Scope and Limitations

This report: has been prepared by GHD for 2270386 Ontario Limited and may only be used and relied on by 2270386 Ontario Limited for the purpose agreed between GHD and 2270386 Ontario Limited as set out in section 1.1 of this report.

GHD otherwise disclaims responsibility to any person other than 2270386 Ontario Limited arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report (refer section(s) 1.1 of this report). GHD disclaims liability arising from any of the assumptions being incorrect.

GHD has prepared the AERMOD dispersion model (v. 22112) and AERMAP surface pre-processor (v. 18081) models ("Models") for, and for the benefit and sole use of, 2270386 Ontario Limited to support dispersion modelling and must not be used for any other purpose or by any other person.

The Model is a representation only and does not reflect reality in every aspect. The Model contains simplified assumptions to derive a modelled outcome. The actual variables will inevitably be different to those used to prepare the Model. Accordingly, the outputs of the Model cannot be relied upon to represent actual conditions without due consideration of the inherent and expected inaccuracies. Such considerations are beyond GHD's scope.

The information, data and assumptions ("Inputs") used as inputs into the Model are from publicly available sources or provided by or on behalf of the 2270386 Ontario Limited, (including possibly through stakeholder engagements). GHD has not independently verified or checked Inputs beyond its agreed scope of work. GHD's scope of work does not include review or update of the Model as further Inputs becomes available.

The Model is limited by the mathematical rules and assumptions that are set out in the Report or included in the Model and by the software environment in which the Model is developed.

The Model is a customised model and not intended to be amended in any form or extracted to other software for amending. Any change made to the Model, other than by GHD, is undertaken on the express understanding that GHD is not responsible, and has no liability, for the changed Model including any outputs.

Accessibility of documents

If this report is required to be accessible in any other format, this can be provided by GHD upon request and at an additional cost if necessary.

2. Initial Identification of Sources and Contaminants

This section provides an initial identification of all of the sources and contaminants emitted at the Site, as required by subparagraphs 2 to 4 of s.26 (1) of O. Reg. 419/05.

The air emissions generated from the Site are detailed below.

Landfill (Source 1)

The waste is received and landfilled within the proposed landfill footprint. The potential emissions from the landfill are Volatile Organic Compounds (VOCs) and odour.

Treated Effluent Tank (Source 2)

BRE operates an on-site leachate treatment system (LTS) in accordance with an approved ECA. Effluent from the LTS is temporarily stored in above-grade effluent storage tanks. The potential emissions from the treated effluent tank is odour.

Aeration System (Source 3)

BRE operates an on-site LTS in accordance with an approved ECA. The LTS includes an aeration system as a treatment component. The potential emissions from the aeration system is odour.

Raw Leachate Tank (Source 4)

BRE operates an on-site LTS in accordance with an approved ECA. Raw leachate is pumped from the landfill leachate collection system to the primary settling tank prior to gravity flow to the LTS. The potential emissions from the leachate tank is odour.

2.1 Sources and Contaminants Identification Table

Table 1 – Sources and Contaminants Identification Table tabulates all the emission sources at the Site. Table 1 provides the information required for subparagraphs 2 to 4 of s.26 (1) of O. Reg. 419/05.

The expected contaminants emitted from each source are also identified in Table 1. Each of the identified sources has been assigned a source reference number.

The location of the discharges from each of the sources is presented on Figure 3 – Site Plan and Air Emission Source Locations as identified by the source reference number.

3. Assessment of Significance of Sources and Contaminants

This section provides an explanation for each source and contaminant identified as negligible in Table 1, as required by subparagraph 5 of s.26 (1) of O. Reg. 419/05.

In accordance with s.8 of O. Reg. 419/05, emission rate calculations and dispersion modelling do not have to be performed for emissions from negligible sources or for the emission of negligible contaminants from significant sources.

3.1 Identification of Negligible Contaminants and Sources

Each negligible source is identified in Table 1.

The remaining sources are significant. These sources will be included in the dispersion modelling for the Site.

Some contaminants from sources that are considered significant have been identified as negligible upon further investigation. This is shown in further detail in Appendix C.

3.2 Rationale for Assessment

For each source or contaminant in Table 1 that has been identified as being negligible there is an accompanying documented rationale. The technical information required to substantiate the argument that each of the identified sources or contaminants is negligible is presented in Appendix C – Supporting Information for Assessment of Negligibility.

4. Operating Conditions, Emissions Estimating, and Data Quality

This section provides a description of the operating conditions used in the calculation of the emission estimates and an assessment of the data quality of the emission estimates for each significant contaminant from the Site as required by subparagraphs 6 and 7 of s.26 (1) of O. Reg. 419/05.

4.1 Description of Operating Conditions

Section 10 of O. Reg. 419/05 states that an acceptable operating condition is a scenario that assumes operating conditions for the Site that would result, for the relevant contaminant, in the highest concentration of the contaminant at a POI that the Site is capable of. The operating condition described in this ESDM Report meets this requirement.

The averaging time for the operating condition is based on the applicable averaging time for each contaminant. The contaminants have either a 10-minute, 1-hour, 24-hour or annual averaging period. The operating condition used for this Site that results in the maximum concentration at a POI is the scenario where all significant sources are operating simultaneously at their individual maximum rates of production.

The individual maximum rates of production for each significant source of emissions correspond to the maximum emission rate during any hour period. The individual maximum rates of production for each significant source of emissions are explicitly described in Appendix B.

4.2 Explanation of the Methods Used to Calculate Emission Rates

The maximum daily and hourly emission rates for each significant contaminant emitted from the significant sources were calculated in accordance with requirements of the ESDM Procedure Document.

The emission rate for each significant contaminant emitted from a significant source was estimated and the methodology for the calculation is documented in Table 2A and Table 2B.

4.3 Sample Calculations

The technical rationale, including sample calculations, required to substantiate the emission rates presented in Table 2A and Table 2B are documented in Appendix B.

4.4 Assessment of Data Quality

This section provides an assessment of the data quality of the emission estimates for each significant contaminant from the Site.

The assessment of the data quality of the emission rate estimates for each significant contaminant emitted from the significant sources was performed in accordance with the requirements of subparagraph 7iii of s.26 (1) of O. Reg. 419/05.

For each contaminant the emission rate was estimated and the data quality of the estimate is documented in Table 2A and Table 2B. The assessment of data quality for each source listed in Table 2A and Table 2B is documented in Appendix B.

All the emission rates listed in Table 2A and Table 2B are documented as having their highest available data quality and correspond to the operating scenario where all significant sources are operating simultaneously at their individual maximum rates of production. Therefore, emission rate estimates listed in Table 2A and Table 2B are not likely to be an underestimate of the actual emission rates and use of these emission rates will result in a calculated concentration at POI greater than the actual concentrations.

5. Source Summary Table and Site Plan

This section provides the table required by subparagraph 8 and the Site plan required by subparagraph 9 of s.26 (1) of O. Reg. 419/05.

5.1 Source Summary Table

For each source of significant contaminants, the following parameters are referenced in Table 2A and Table 2B and are as follows:

- Contaminant
- Chemical Abstract Society (CAS) reference number
- Source reference number
- Source description
- Stack parameters (flow rate, exhaust temperature, diameter, height above grade, height above roof)
- Location referenced to a Universal Transverse Mercator (UTM) coordinate system presented on Figure 3
- Maximum emission rate
- Averaging period
- Emission estimating technique
- Estimation of data quality
- Percentage of overall emission

5.2 Site Plan

The locations of the emission sources listed in Table 1 are presented on Figure 3; the location of each of the sources is specified with the source reference number. The location of the property-line is indicated on Figure 3, with the end points of each section of the property-line clearly referenced in UTM coordinate system. The location of each source is referenced to the UTM coordinates system under a column in Table 2A and Table 2B.

6. Dispersion Modelling

This section provides a description of how the dispersion modelling was conducted at the Site to calculate the maximum concentration at a POI.

The dispersion modelling was conducted in accordance with the Ministry publication "Air Dispersion Modelling Guideline for Ontario (February 2017)" PIBS 5165e03 (The ADMGO). A general description of the input data used in the dispersion model is summarized in Table 3.

As identified in Section 1.2, this Site is subject to s. 20 of O. Reg. 419/05, and the Site's compliance is assessed using Schedule 5 of O. Reg. 419/05. Furthermore, compliance is assessed using the United States Environmental Protection Agency (USEPA) atmospheric dispersion model AERMOD.

The AERMOD modelling system has been identified by the MECP as one of the approved dispersion models under O. Reg. 419/05, and currently includes the Plume Rise Model Enhancements (PRIME) algorithms for assessing the effects of buildings on air dispersion.

The AERMOD modelling system is made up of the AERMOD dispersion model, the AERMET meteorological pre-processor and the AERMAP terrain pre-processor. The following approved dispersion model and pre-processors were used in the assessment:

– AERMOD dispersion model (v. 22112)
– AERMAP surface pre-processor (v. 18081)

AERMET was not used in this assessment, as a pre-processed MECP meteorological dataset was used.

A summary of the AERMOD source input parameters is provided in Appendix D.

The emission rates used in the dispersion model meet the requirements of Section 11 (1) 1 of O. Reg. 419/05, which requires that the emission rate used in the dispersion model is at least as high as the maximum emission rate that the source of contaminant is reasonably capable of for the relevant contaminant. These emission rates are further described in Appendix B.

There is no childcare facility, health care facility, senior's residence, long-term care facility or an education facility located at the Site.

6.1 Dispersion Modelling Input Summary Table

A description of how the approved dispersion model was performed is included in Table 3. This table meets both requirements of s.26 (1) 11 and Sections 8-17 of O. Reg. 419/05 and follows formatting provided in the ESDM Procedure Document.

6.2 Co-ordinate System

The Universal Transverse Mercator (UTM) coordinate system, as per Section 5.2.2 of the ADMGO, was used to specify model object sources and receptors. All coordinates were defined in the North American Datum of 1983 (NAD83).

All sources and the property line coordinates are provided on Figure 3.

6.3 Meteorology and Land Use Zoning Plan

Subparagraph 10 of s.26 (1) of O. Reg. 419/05 requires a description of the local land use conditions if meteorological data described in paragraph 2 of s.13 (1) of O. Reg. 419/05 was used. The AERMOD model was run using a MECP site specific pre-processed 5-year dispersion meteorological data set (i.e., surface and profile files).

A land use zoning plan is provided on Figure 2. Figure 2 also illustrates the extents of the Site property boundary and provides zoning of adjacent land uses. The Site is located in an area zoned Disposal Industrial. The land surrounding the Site is zoned Agricultural.

6.4 Terrain

AERMOD captures the essential physics of dispersion in complex terrain though the use of a separate height scale factor for each receptor (USEPA, 1998 – AERMAP UG). The highest scale factor represents the terrain that would dominate flow in the vicinity of the receptor.

The height scale factor that is used by AERMOD is generated by an AERMAP terrain pre-processor. AERMAP utilizes terrain data, or Digital Elevation Model (DEM) data in conjunction with a layout of receptors and sources to height scale factors that can be directly used in AERMOD. Terrain data used in this assessment was obtained from MECP (7.5-minute format).

6.5 Receptors

Receptors were chosen based on recommendations provided in Section 7.1 of the ADMGO, which is in accordance with s.14 of O. Reg. 419/05. A tiered receptor grid was defined starting with a rectangular boundary that encloses all the modelled sources (bounding box). A tiered grid was then defined starting from the edge of the bounding box with a fine resolution, to coarser resolutions further away. All tiered distances were defined relative to the bounding box. The receptor grid used is described as follows:

– 20-m spacing within 200 m of the edge of the bounding box
– 50-m spacing from 200 to 500 m
– 100-m spacing from 500 to 1,000 m
– 200-m spacing from 1,000 to 2,000 m
– 500-m spacing from 2,000 to 5,000 m

A property line ground level receptor grid with 10-m spacing was used to evaluate the maximum property boundary concentration. No receptors were placed inside the Site's property line. Sensitive receptors used for this assessment are shown in Figure 5.

6.6 Deposition

AERMOD has the ability to account for wet and dry deposition of substances that would reduce ground level concentrations at POIs. However, the deposition algorithm has not been implemented in this assessment and therefore, the predicted POI concentrations are considered to be more conservative.

6.7 Averaging Time and Conversions

The shortest time scale that AERMOD predicts is a 1-hour average value. Schedule 3 standards of O. Reg. 419/05 apply to this Site; these standards are based on 1-hour and 24-hour averaging times, which are averaging times that are easily provided by AERMOD Dispersion Modelling Options.

The options used in the AERMOD dispersion model are summarized in the table below:

Modelling Parameter	Description	Used in the Assessment?
DFAULT	Specifies that regulatory default options will be used	No, the non-default BETA option was used
BETA	Specifies that horizontal and capped sources dispersion algorithms will be used	Yes, the BETA option is the only non-default option that may be used without prior MECP approval

Modelling Parameter	Description	Used in the Assessment?
CONC	Specifies that concentration values will be calculated	Yes
DDPLETE	Specifies that dry deposition will be calculated	No
WDPLETE	Specifies that wet deposition will be calculated	No
FLAT	Specifies that the non-default option of assuming flat terrain will be used	No, the model will use elevated terrain as detailed in the AERMAP output
NOSTD	Specifies that the non-default option of no stack-tip downwash will be used	No
AVERTIME	Time averaging periods calculated	1-hour, 24-hour
URBANOPT	Allows model to incorporate the effects of increased surface heating from an urban area on pollutant dispersion under stable atmospheric conditions	No
URBANROUGHNESS	Specifies the urban roughness length (mm)	Not Applicable
FLAGPOLE	Specifies that receptor heights above local ground levels are allowed on the receptors	No

6.8 Dispersion Modelling Input and Output Files

The information input into the approved dispersion model is recorded in Appendix D. Appendix D also includes the input and output files from the AERMOD model in electronic form.

Table D.1 provides a detailed description of the source input parameters.

7. Emission Summary Table and Conclusions

This section provides the table required by subparagraph 14 of s.26 (1) of O. Reg. 419/05 and provides an interpretation of the results as required by the ESDM Procedure Report.

7.1 Emission Summary Table

A POI concentration for each significant contaminant emitted from the Site was calculated based on the emission rates listed in Table 2. The output from the approved dispersion model is presented in Appendix D. The results are presented in Table 4. This Table follows the format provided in the ESDM Procedure Document. For each source of significant contaminants, the following parameters are referenced:

– Contaminant name
– CAS number
– Total Site emission rate
– Approved dispersion model used
– Maximum POI concentration
– Averaging period for the dispersion modelling
– MECP POI limit
– Indication of limiting effect
– Schedule in Regulation 419/05
– The percentage of standard

The POI concentrations listed in Table 4 were compared against criteria listed in the MECP ACB List

7.2 Assessment of Contaminants with No MECP POI Limits

All contaminants have corresponding criteria.

7.3 Conclusions

This ESDM Report was prepared in accordance with s.26 of O. Reg. 419/05. In addition, guidance in the ESDM Procedure Document was followed as appropriate.

The emission rate estimates for each source of significant contaminants are documented in Table 2A and Table 2B. All the emission rates listed in Table 2A and Table 2B are documented as having their highest available data quality and correspond to the operating scenario where all significant sources are operating simultaneously at their individual maximum rates of production. Therefore, these emission rate estimates listed in Table 2A and Table 2B are not likely to be an underestimate of the actual emission rates.

A POI concentration for each significant contaminant emitted from the Site was calculated based on the calculated emission rates and the output from AERMOD model; the results are presented in Table 4.

The POI concentrations listed in Table 4 were compared against criteria listed in the MECP ACB List.

This ESDM Report demonstrates that the Site can operate in compliance with O. Reg. 419/05.

Table 3

Dispersion Modelling Input Summary Table
Brooks Road Landfill
Cayuga, Ontario

Relevant Section of the Regulation	Section Title	Description of How the Approved Dispersion Model was Used
Section 8	Negligible Sources	Sources and contaminants that were considered negligible were explicitly identified, and therefore were not modelled, in accordance with s.8 of O. Reg. 419. See Table 1 - Sources and Contaminants Identification Table and Appendix C of the ESDM Report for more information
Section 9	Same Structure Contamination	Not applicable as Brooks Road is the only tenant occupying the building, and does not have a child care facility, health care facility, senior's residence, long-term care facility or an educational facility located at the Facility
Section 10	Operating Conditions	All equipment was assumed to be operating at the maximum production rates at the same time. See Section 4.1 and Appendix B of the ESDM Report.
Section 11	Source of Contaminant Emission Rate	The emission rate for each significant contaminant emitted from a significant source was estimated, the methodology for the calculation is documented in Table 2 - Source Summary Table. See Section 4.1 and Section 4.2 and Appendix B of the ESDM Report for more information.
Section 12	Combined Effect of Assumptions for Operating Conditions and Emission Rates	The operating conditions were estimated in accordance with s.10(1) and 1 and S.11 (1) 1 of O. Reg. 419 and are therefore considered to result in the highest concentrations at POI that the Facility is capable of for the contaminants emitted. See Section 4.1 and Section 4.2 of the ESDM Report.
Section 13	Meteorological Conditions	MECP site specific screening data was used.
Section 14	Area of Modelling Coverage	Completed in compliance with MECP Modelling Guidance
Section 15	Stack Height	Documented in accordance with MECP guidance
Section 16	Terrain Data	MECP available terrain data sets were used.
Section 17	Averaging Periods	The averaging periods used for each contaminant are summarized on Table 4 and Appendix C.

Appendix A

Environmental Compliance Approval

No. 7323-C6EJUM

AMENDED ENVIRONMENTAL COMPLIANCE APPROVAL
NUMBER 7323-C6EJUM
Issue Date: September 24, 2021

2270386 Ontario Limited
162 Cumberland Street
Toronto, Ontario
M5R 3N5

Site Location: Brooks Road Landfill Site
160 Brooks Rd North, Cayuga, Haldimand County, Ontario.

You have applied under section 20.2 of Part II.1 of the Environmental Protection Act , R.S.O. 1990, c. E. 19 (Environmental Protection Act) for approval of:

- one (1) landfill site, having a capacity of 1,045,065 cubic metres (including waste and daily cover), a maximum fill rate of 250,000 tonnes per year and 1,000 tonnes per day;
- one (1) leachate treatment system, having a rated capacity of 200 cubic metres per day, complete with a leachate collection sump, a raw leachate primary settling tank, an aeration system and above-grade treated effluent storage tanks;

all in accordance with the supporting information listed in Schedule A.

For the purpose of this environmental compliance approval, the following definitions apply:

1. "Acoustic Assessment Report" means the report, prepared in accordance with Publication NPC-233 submitted in support of the application, that documents all sources of noise emissions and Noise Control Measures present at the Facility. "Acoustic Assessment Report" also means the Acoustic Assessment Report prepared by GHD, dated September 7, 2021 and signed by Michael Masschaele;
2. "Approval" means this Environmental Compliance Approval, including the application and supporting documentation listed above;
3. "Company" means 2270386 Ontario Limited, that is responsible for the construction or operation of the Facility and includes any successors and assigns;
4. "District Manager" means the District Manager of the appropriate local district office of the Ministry, where the Facility is geographically located;

5. "EPA" means the Environmental Protection Act, R.S.O. 1990, c.E.19, as amended;
6. "Equipment" means all the equipment, described in the Company's application, this Approval and in the supporting documentation submitted with the application, to the extent approved by this Approval;
7. "ESDM report" means the Emission Summary and Dispersion Modelling Report which was prepared in accordance with section 26 of O. Reg. 419/05 and the Procedure Document by GHD and dated June 11, 2021, submitted in support of the application, and includes any changes to the report made up to the date of issuance of this Approval;
8. "Facility" means the entire operation located on the property where the Equipment is located;
9. "Manual" means a document or a set of documents that provide written instructions to staff of the Company;
10. "Ministry" means the ministry of the government of Ontario responsible for the EPA and includes all officials, employees or other persons acting on its behalf;
11. "Noise Control Measures" means measures to reduce the noise emissions from the Facility and/or Equipment including, but not limited to, silencers, acoustic louvres, enclosures, absorptive treatment, plenums and barriers;
12. "Noise Guidelines for Landfill Sites" means the Ministry draft publication "Noise Guidelines for Landfill Sites", October 1998, as amended;
13. "Odour Management Plan" means the Odour Management Plan, Brooks Road Landfill Site, Haldimand County, prepared by GHD, dated June 11, 2021 that includes mitigation measures to minimize off-Site odour impacts, and if appropriate, a trigger mechanism and contingency plan;
14. "Publication NPC-233" means the Ministry Publication NPC-233, "Information to be Submitted for Approval of Stationary Sources of Sound", October, 1995;
15. "Publication NPC-300" means the Ministry Publication NPC-300, “Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning, Publication NPC-300”, August 2013, as amended;
16. “Site" means the entire waste disposal site, including the buffer lands, at the Brooks Road Landfill Site, Lot 24, Concession 1 North, Haldimand County; and
17. "Truck(s)" means trucks carrying waste for disposal at the Facility.

You are hereby notified that this environmental compliance approval is issued to you subject to the terms and conditions outlined below:

TERMS AND CONDITIONS

1. **OPERATION AND MAINTENANCE**
    1. The Company shall prepare, not later than three (3) months from the date of this Approval, implement and continue to update as necessary, a Manual outlining the operating procedures and maintenance programs for the Equipment/Facility, which shall specify as a minimum:
        a. routine operating and maintenance procedures in accordance with good engineering practices;
        b. emergency procedures;
        c. frequency of inspections and scheduled preventative maintenance;
        d. procedures to prevent upset conditions;
        e. all appropriate measures to prevent/minimize fugitive particulate matter, noise and odorous emissions from all potential sources at the Site; and
        f. procedures for record keeping activities relating to the operation and maintenance programs.
    2. The Company shall ensure that the Facility/Equipment is properly operated and maintained at all times and in accordance with this Approval, the operating procedures and maintenance Manual, and the Odour Management Plan.
2. **ODOUR MANAGEMENT PLAN**
    1. The Company shall forthwith implement the Odour Management Plan and continue to review and update as necessary and in consultation with the District Manager as applicable.
    2. If there is any odour complaint, or significant odour is detected during daily inspection, and the odour is confirmed to originate from the Site, mitigation measures shall be implemented immediately in accordance with the Odour Management Plan.
    3. If odour causes adverse off-site impacts that are not mitigated through implementation of odour mitigation measures according to the Odour Management Plan, the Company shall, upon written notification from the District Manager, conduct an investigation into the cause as to why the impacts were not mitigated and submit to the District Manager within the time frame identified in the notice, an assessment of the issues and the need for implementation of contingency actions in accordance with the Odour Management Plan.
    4. If the Ministry deems the odour mitigation measures taken as per Condition

2.3 to be unsuitable, insufficient or ineffective, the District Manager may direct the Company, in writing, to propose further measures to address the noted failure, upset or malfunction, which may include requiring a reduction in the receipt of waste, cessation of the receipt of waste, removal and disposal of waste from the waste diversion area, the removal of leachate from the Site as well as, making repairs or modifications to equipment or processes. Such measures shall be implemented by the Company upon approval by the District Manager.

5. If the cessation of the receipt of waste is required, as determined by Condition 2.4, no waste shall be received at the Site until the District Manager is satisfied that odour impacts have been adequately mitigated.
6. The Company shall prepare and maintain an annual summary of the actions taken and achievements made under the Odour Management Plan as of December 31 of the previous calendar year.

3. **NOISE**
    1. The Company shall, at all times, ensure that the noise emissions from the Facility comply with the limits set out in Ministry Publication NPC-300.
    2. The Company shall, at all times, ensure that the noise emissions from the landfill site operations at the Facility comply with the limits set out in Ministry draft publication "Noise Guidelines for Landfill Sites".
    3. The Company shall ensure that the operating times and numbers of Equipment are limited as detailed in Section 2 of the Acoustic Assessment Report.
    4. The Company shall limit Truck arrivals and departures to a maximum of sixteen (16) trucks per sixty (60) minute period, restricted to the daytime hours from 7 a.m. to 7 p.m.

4. **COMPLAINTS RESPONSE PROCEDURE**
    1. The Company shall develop in consultation with the District Manager, not later than three (3) months from the date of this Approval, implement and continue to update as necessary, a Complaint Response Protocol for dealing with and responding to environmental complaints as a result of operation of the Equipment/Facility approved by this Approval. The Complaint Response Protocol shall include:
        a. procedures for recording the complaint;
        b. procedures for investigating the complaint, including determining all possible causes of the complaint, and the necessary actions to appropriately deal with the cause of the subject matter of the complaint;

c. procedures for taking the necessary actions to appropriately deal with the cause of the subject matter of the complaint in a timely and effective manner;

d. a description of any measures taken to address the complaint, outcome of the actions taken and steps to be taken to avoid the recurrence of similar incidents;

e. procedures for record keeping of activities relating to the complaints;

f. procedures for notifying the District Manager of the complaint in a manner acceptable to the District Manager; and

g. procedures for replying to the complainant.

5. **RECORD RETENTION**
    1. Any information requested by any employee in or agent of the Ministry concerning the Facility and its operation under this Approval, including, but not limited to, any records required to be kept by this Approval, shall be provided to the employee in or agent of the Ministry, upon request, in a timely manner. Unless otherwise specified in this Approval, the Company shall retain, for a minimum of five (5) years from the date of their creation all reports, records and information described in this Approval, including,
        a. a copy of the ESDM Report;
        b. a copy of the Odour Management Plan and activities pertaining to the implementation of the Odour Management Plan;
        c. a copy of the Acoustic Assessment Report;
        d. records of maintenance, repair and inspection of Equipment/Facility;
        e. all records of any upset conditions associated with the operation of the Equipment/Facility;
        f. all records on the environmental complaints, as required under condition 4.

SCHEDULE A

Supporting Documentation

1. Environmental Compliance Approval Application and all supporting information, dated June 1, 2021, signed by Richard Weldon and submitted by the Company;
2. Emission Summary and Dispersion Modelling Report, dated June 11, 2021 and prepared by GHD;

3. Odour Management Plan, dated June 11, 2021 and prepared by GHD;
4. Acoustic Assessment Report prepared by GHD, dated September 7, 2021 and signed by Michael Masschaele; and the additional information provided by Sam East of GHD in the email dated September 7, 2021 and Daniel Turner of GHD in the email dated September 10, 2021.

The reasons for the imposition of these terms and conditions are as follows:

1. Condition No. 1 is included to emphasize that the Equipment/Facility must be maintained and operated according to a procedure that will result in compliance with the EPA, the Regulations and this Approval.
2. Condition No. 2 is included to ensure that the Equipment/Facility is operated in a manner that does not result in unacceptable odour emissions and mitigation measures are employed in event of an odour impact.
3. Condition No. 3 is included to provide the minimum performance requirements considered necessary to prevent an adverse effect resulting from the operation of the Equipment/Facility.
4. Condition Nos. 4 and 5 are included to require the Company to keep records and to provide information to the Ministry so that compliance with the EPA, the regulations and this Approval can be verified.

Upon issuance of the environmental compliance approval, I hereby revoke Approval No(s). 8922-9ZHR29 issued on October 8, 2015.

In accordance with Section 139 of the Environmental Protection Act, you may by written Notice served upon me and the Environmental Review Tribunal within 15 days after receipt of this Notice, require a hearing by the Tribunal. Section 142 of the Environmental Protection Act provides that the Notice requiring the hearing shall state:

a. The portions of the environmental compliance approval or each term or condition in the environmental compliance approval in respect of which the hearing is required, and;
b. The grounds on which you intend to rely at the hearing in relation to each portion appealed.

Pursuant to subsection 139(3) of the Environmental Protection Act, a hearing may not be required with respect to any terms and conditions in this environmental compliance approval, if the terms and conditions are substantially the same as those contained in an approval that is amended or revoked by this environmental compliance approval.

The Notice should also include:

1. The name of the appellant;
2. The address of the appellant;
3. The environmental compliance approval number;
4. The date of the environmental compliance approval;
5. The name of the Director, and;
6. The municipality or municipalities within which the project is to be engaged in.

And the Notice should be signed and dated by the appellant.

This Notice must be served upon:

The Secretary*
Environmental Review Tribunal
655 Bay Street, Suite 1500
Toronto, Ontario
M5G 1E5

AND

The Director appointed for the purposes of Part II.1 of the Environmental Protection Act
Ministry of the Environment, Conservation and Parks
135 St. Clair Avenue West, 1st Floor
Toronto, Ontario
M4V 1P5

*** Further information on the Environmental Review Tribunal's requirements for an appeal can be obtained directly from the Tribunal at: Tel: (416) 212-6349, Fax: (416) 326-5370 or** www.ert.gov.on.ca

The above noted activity is approved under s.20.3 of Part II.1 of the Environmental Protection Act.

DATED AT TORONTO this 24th day of September, 2021

Neryed Ragbar, P.Eng.
Director
appointed for the purposes of Part II.1 of the *Environmental Protection Act*

QN/
c: District Manager, MECP Hamilton - District
Daniel Turner, GHD

Appendix B

Sample Calculations

Appendix B Supporting Calculations Brooks Road Environmental

Source S-1: Landfill

Methodology: Emission Factor

The emission rates were based on the Volatile Organic Compound (VOC) factor and the maximum landfill gas generation. The VOC Factors from the Landfill were calculated based on the average concentrations reported in US EPA Chapter 2.4 "Municipal Solid Waste Landfills", as published in November 1998 and the ratio of the non-methane organic compounds and the molecular weight of hexane (average non-methane organic compound). For the parameters that are not VOCs, the VOC factor was calculated from the average concentration. The maximum landfill gas generation was based on the memorandum in Appendix E.

Table B.1 provides a summary of the emission calculations from the Landfill.

Sample Calculation: Dichlorodifluoromethane (VOC)

$$VOC\ Factor = 3.595 \times 10^{-9} \frac{kg/L}{ppm} \times {}^{Molecular\ Weight}/_{Hexane\ Molecular\ Weight} \times Concentration$$

$$VOC\ Factor = 3.595 \times 10^{-9} \frac{kg/L}{ppm} \times {}^{120.91}/_{86.18} \times 15.7\ ppm$$

$$VOC\ Factor = 7.92\ \times 10^{-8} \frac{kg}{L}$$

$$Emission\ Rate = \ Maximum\ Landfill\ Gas\ Generation\ \times VOC\ Factor$$

$$ER = 2{,}888{,}172 \frac{m^3}{yr} \times 7.92\ \times 10^{2} \frac{kg}{L} \times 1000 \frac{L}{m^3} \times 1000 \frac{g}{kg} \times 365\ \frac{days}{year} \times 24 \frac{hours}{day} \times 3600 \frac{seconds}{hour}$$

$$ER = 7.25\ \times 10^{-3} \frac{g}{s}$$

Sample Calculation: Mercury (non-VOC)

$$VOC\ Factor = 3.595 \times 10^{-9} \frac{kg/L}{ppm} \times Concentration$$

$$VOC\ Factor = 3.595 \times 10^{-9} \frac{kg/L}{ppm} \times 2.92 \times 10^{-4}\ ppm$$

$$VOC\ Factor = 1.05\ \times 10^{-12} \frac{kg}{L}$$

$$Emission\ Rate = \ Maximum\ Landfill\ Gas\ Generation\ \times VOC\ Factor$$

$$ER = 2{,}888{,}172 \frac{m^3}{yr} \times 1.05\ \times 10^{-12} \frac{kg}{L} \times 1000 \frac{L}{m^3} \times 1000 \frac{g}{kg} \times 365\ \frac{days}{year} \times 24 \frac{hours}{day} \times 3600 \frac{seconds}{hour}$$

$$ER = 9.61\ \times 10^{-8} \frac{g}{s}$$

Data Quality: Average

Section 9.2.3 of the ESDM Procedure Document titled "Average Data Quality" Emission Estimating Techniques includes emission rate estimates developed from tests on a reasonable number of sources.

Operating Condition, Individual Maximum Rates of Production:

The emission rate calculation for this source is based on the maximum capacity of the source.

Source S-1: Landfill

Methodology: Emission Factor

The odour emissions from the Landfill was based on the default landfill gas concentration from the "Interim Guide to Estimate and Assess Landfill Air Impacts", as published by Resource Branch in October 1992 and the landfill gas generation rate. The landfill gas generation rate was based on the landfill gas generation rate, provided in the report found in Appendix E.

Table B.2 provides a summary of the Odour emission calculations from the Landfill.

Sample Calculation: Odour

$ER = 10{,}000\ ou\ \times 0.0916 \frac{m^3}{s}$

$ER = 9.16\ \times 10^2 \frac{ou}{s}$

Data Quality: Average

Section 9.2.3 of the ESDM Procedure Document titled "Average Data Quality" Emission Estimating Techniques includes emission rate estimates developed from tests on a reasonable number of sources.

Operating Condition, Individual Maximum Rates of Production:

The emission rate calculation for this source is based on the maximum capacity of the source.

Source S-2: *Treated* Effluent Odour Emissions

Methodology: Engineering Calculation

The emissions from the treated leachate were based on the "Design and Operations Report" published by GHD in April, 2019 and the fill rate of 18.92 L/s.

Table B.3 provides a summary of the Odour emission calculations from the treated leachate tank.

Sample Calculation: Odour

$ER = 100\ ou\ \times 0.0189 \frac{m^3}{s}$

$ER = 1.89\ \frac{ou}{s}$

Data Quality: Average

Section 9.2.3 of the ESDM Procedure Document titled "Average Data Quality" Emission Estimating Techniques includes engineering calculations.

Operating Condition, Individual Maximum Rates of Production:

The emission rate calculation for this source is based on the maximum capacity of the source.

Source S-3: Aeration System Odour Emissions

Methodology: Engineering Calculation

The emissions from the aeration system were assumed to be similar to a Sludge Blend Tank "Odour Threshold Emission Factor for Common WWTP Processes", as published in 2008 and the flow rate of 22 m^3 per minute.

Table B.4 provides a summary of the Odour emission calculations from the aeration system.

Sample Calculation: Odour

$ER = 7{,}000\ ou\ \times 0.3667 \frac{m^3}{s}$

$ER = 2.57\ \times 10^3 \frac{ou}{s}$

Data Quality: Average

Section 9.2.3 of the ESDM Procedure Document titled "Average Data Quality" Emission Estimating Techniques includes engineering calculations.

Operating Condition, Individual Maximum Rates of Production:

The emission rate calculation for this source is based on the maximum capacity of the source.

Source S-4: *Raw* Leachate Odour Emissions

Methodology: Engineering Calculation

The emissions from the raw leachate were assumed to be similar to a Sludge Blend Tank "Odour Threshold Emission Factor for Common WWTP Processes", as published in 2008 and the fill rate of 18.92 L/s.

Table B.5 provides a summary of the Odour emission calculations from the raw leachate tank.

Sample Calculation: Odour

$ER = 7{,}000\ ou\ \times 0.0189 \frac{m^3}{s}$

$ER = 1.32\ \times 10^2 \frac{ou}{s}$

Data Quality: Average

Section 9.2.3 of the ESDM Procedure Document titled "Average Data Quality" Emission Estimating Techniques includes engineering calculations.

Operating Condition, Individual Maximum Rates of Production:

The emission rate calculation for this source is based on the maximum capacity of the source.

Cyclohexane	110-82-7	2.10	7.37E-09	2.19E+01	6.93E-04
NMOC (1)		454	1.63E-06	4.84E+03	1.54E-01
Hydrogen Sulphide (3)	7783-06-4	35.5	1.28E-07	3.79E+02	1.20E-02

Notes:

NMOC -non methane organic compound - based on hexane as the average NMOC.
(1) The concentrations are based on the reported USEPA AP42, Chapter 2.4 - Municipal Solid Waste Landfills (November 1998) values.
(2) VOC factor is calculated based on the ratio of the molecular weight of the NMOC and the molecular weight of hexane (the average NMOC as detailed above) and the average concentration of the NMOC.
(3) As these compounds are not VOC's, the VOC factor has been calculated just from the average concentration and not the ratio of the molecular weight of the compound and the molecular weight of hexane.
(4) Gas generation rate based on memorandum in Appendix E.

Table B.2

Summary of Odour Emissions from Landfill
Brooks Road Landfill
Cayuga, Ontario

Source ID	Description	Odour Concentration (ou) (1)	Landfill Gas Generation Rate (m^3/s) (2)	Emission Rate (ou/s)
S-1	Landfill	10,000	0.094	9.41E+02

Notes:

(1) Default landfill gas concentration from "Interim Guide to Estimate and Assess Landfill Air Impacts", Resource Branch, October 1992.

(2) Based on landfill gas generation rate of 338.6 m^3/hr of landfill gas, report provided in Appendix E.

Appendix C

Supporting Information for Assessment of Negligibility

Appendix C Supporting Information for Assessment of Negligibility Brooks Road Environmental

Sources were screened for negligibility using the following screening protocols listed in the ESDM Procedure Document:

– Identifying significant contaminants using an emission threshold (Section 7.1.2)
– Fugitive dust from on-site roadways (Section 7.4)

The results of the screening are discussed in greater detail in the following text.

Identifying Significant Contaminants using an Emission Threshold:

Section 7.1.2 of the ESDM Procedure Document states that contaminants that are emitted from a specific facility may be identified as negligible when they are below emissions thresholds that are developed using the following formula:

$$\text{Emission Threshold (g/s)} = \frac{0.5 \times \text{MECP POI Limit } (\mu g/m^3)}{\text{Dispersion Factor } (\mu g/m^3 \text{ per g/s emission})}$$

All Site emissions of contaminants with an MECP POI limit were assessed against the appropriate emission threshold based on the appropriate 1-hour rural dispersion factor of 10,000 $\mu g/m^3$ per g/s 20 m from the property boundary. For 10-minute standards a conversion of 1.65 was used. For 30-minute standards a conversion of 1.2 was used. For 24-hour standards a conversion of 0.4 was used. A number of contaminants are deemed to be emitted in negligible amounts, as indicated in Table C.1.

Table C.1

Predicted Methane Generation Memorandum

Memorandum

February 27, 2024

To	Neil Shannick, PEng		
From	Bryan Szalda	**Tel**	+1 519 884 0510
Subject	**Predicted Methane Generation Brooks Road Landfill**	**Project no.**	12561524

Purpose of this Memorandum

This memorandum presents a summary of the methane generation modelling analysis for the Brooks Road Landfill located in Cayuga, Ontario (Site). This assessment is a revision to the previous assessment for the Site initially undertaken in November 2016 as part of the Environmental Assessment for a Landfill Expansion project that was used to approve the existing Site Environmental Compliance Approval (ECA) No. A110302, dated October 1, 2021. This assessment forms part of an ECA amendment application to seek approval for Stage 9.

Scope and Limitations

This report: has been prepared by GHD for 2270386 Ontario Limited and may only be used and relied on by 2270386 Ontario Limited for the purpose agreed between GHD and 2270386 Ontario Limited as set out in the introductory paragraph of this report.

GHD otherwise disclaims responsibility to any person other than 2270386 Ontario Limited arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

GHD has prepared the Scholl Canyon model ("Model") for, and for the benefit and sole use of, 2270386 Ontario Limited to support estimation of methane generation and must not be used for any other purpose or by any other person.

The Model is a representation only and does not reflect reality in every aspect. The Model contains simplified assumptions to derive a modelled outcome. The actual variables will inevitably be different to those used to prepare the Model. Accordingly, the outputs of the Model cannot be relied upon to represent actual conditions without due consideration of the inherent and expected inaccuracies. Such considerations are beyond GHD's scope.

The information, data and assumptions ("Inputs") used as inputs into the Model are from publicly available sources or provided by or on behalf of the 2270386 Ontario Limited, (including possibly through stakeholder engagements). GHD has not independently verified or checked Inputs beyond its agreed scope of work. GHD's scope of work does not include review or update of the Model as further Inputs becomes available.

The Model is limited by the mathematical rules and assumptions that are set out in the Report or included in the Model and by the software environment in which the Model is developed.

The Model is a customised model and not intended to be amended in any form or extracted to other software for amending. Any change made to the Model, other than by GHD, is undertaken on the express understanding that GHD is not responsible, and has no liability, for the changed Model including any outputs.

GHD has prepared this report on the basis of information provided by 2270386 Ontario Limited and others who provided information to GHD (including Government authorities)], which GHD has not independently verified or checked beyond the agreed scope of work. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

Accessibility of documents

If this report is required to be accessible in any other format, this can be provided by GHD upon request and at an additional cost if necessary.

Predicted Methane Generation

Consistent with the previous methane generation assessment, modelling was undertaken in accordance with Title 40 of the United States Code of Federal Regulations (CFR), Part 98, Subpart HH (Mandatory Greenhouse Gas [GHG] Reporting for Municipal Solid Waste [MSW] Landfills) (Title 40 CFR Mandatory GHG Reporting Requirements). This method is generally in accordance with the Ontario Ministry of the Environment, Conservation and Parks (MECP), (formerly Ministry of the Environment [MOE]) Air Resources Branch guidance document entitled “Interim Guide to Estimate and Assess Landfill Air Impacts” dated October 1992 that references methods and default parameters within US Title 40 CFR. This assessment uses the most recent methods for estimating landfill gas within US Title 40 CFR as supplemented by Environment and Climate Change Canada’s (ECCC’s) Greenhouse Gas Reporting Program (GHGRP).

There are two modelling simulations considered in this revised assessment:

– Simulation 1: The modelling methodology was taken from the Title 40 CFR Mandatory GHG Reporting Requirements. The waste types were broken down into specific categories (bulk waste, garden waste, construction and demolition (C&D) waste, sewage sludge, food waste, and inert waste) and the degradable organic content (DOC) and reactivity constant (k) values from 40 CFR 98 Subpart HH were applied to each respective waste category.
– Simulation 2: An average degradable organic content (DOC) and reactivity constant (k) were taken from ECCC’s document *National Inventory Report 1990 – 2018: Greenhouse Gas Sources and Sinks in Canada* and applied to total putrescible waste accepted. Inert waste was excluded from the model as it does not break down into methane.

This modelling analysis only details anthropogenic emissions from the landfill and does not include biogenic emissions.

Simulation 1 – Waste Category Specific Model

Modelling Methane Generation – No Gas Collection System

The methane generation within a landfill for a given year, G_{CH4}, was calculated based on historical waste records. Equation 1 presents the Scholl Canyon equation which is used to calculate the methane generation from a landfill for a given year:

$$G_{CH4} = \sum \{W_x * L_{o,x} * (e^{-k\,(T - x - 1)} - e^{-k\,(T - x)})\} \quad \text{[for x = S through T-1]} \quad (1)$$

Where:

– G_{CH4} = modelled methane generation rate in year, T, in metric tonnes per year
– x = year in which waste was disposed
– S = start year of calculation

– T = reporting year for which emissions are calculated
– W_x = quantity of waste disposed in year x (metric tonnes, wet weight)
– L_o = CH_4 generation potential (metric tonnes CH_4/metric tonnes waste)
– k = decay rate constant from Table 1 (yr^{-1})

The methane generation potential, L_o, is calculated using Equation 2:

$$L_o = \frac{MCF * DOC * DOC_F * F * 16}{12} \quad (2)$$

Where:

– L_o = CH_4 generation potential (metric tonnes CH_4/metric tonnes waste)
– MCF = Methane correction factor (default value is 1)
– DOC = Degradable organic carbon from Table 1 (metric tonnes of carbon/metric tonne waste)
– DOC_F = Fraction of DOC dissimilated (default value is 0.5)
– F = Fraction by volume of CH_4 in landfill gas from measurement data, if available (default value is 0.5)

Actual waste disposal numbers were provided by the Site in the form of a Material Activity Report for the period of October 8, 2009 through October 9, 2016 and annual reports for the period of 2016 through 2020. Refer to Attachment 1 for these reports. Table 1 provides a summary of the potential modelling parameters from 40 CFR 98 Subpart HH differentiated by waste categories (i.e., bulk waste, C&D waste, food waste, garden waste, sewage sludge, or inerts). Tables 2A through 2F present the breakdown of waste into the categories shown in Table 1 along with the approximate composition (percent of total landfilled waste in a given year).

The approved capacity of the existing landfill is 1,045,065 m^3. Stage 9 includes an additional 219,400 m^3 for a total proposed capacity of 1,264,465 m^3. A waste acceptance rate of 250,000 tonnes per year was assumed for future years (starting in 2023) until the total proposed landfill capacity was reached (approximately 2026). While landfill closure is anticipated to occur in 2026 based on recent filling rates, the evaluation of an accelerated closure period represents a conservative estimate, providing a higher peak year methane generation rate (i.e., representing a worst-case scenario). Waste composition for future years (starting in 2021) was assumed to be the same as shown in Table 2F, which presents average waste composition data from 2016 to 2020. Table 3 presents the annual breakdown of waste quantities for the Brooks Road Landfill from the open year (2009) to closure (approximately 2026). Capacity consumed each future year is based on the in-place waste density of 1.956 tonnes/m^3.

Table 4 presents a summary of the input values used for the model. A review of climate data for the Site shows that the average precipitation is 500-1,000 mm (20-40 inches) per year. It is assumed that mean annual precipitation exceeds the potential evapotranspiration rate at the Site. The default methane concentration of 50 percent by volume was also assumed.

The estimated methane generation in the peak year (2026) for each waste category is shown in the following tables:

– Table 5 bulk waste
– Table 6 C&D
– Table 7 sewage sludge
– Table 8 garden waste
– Table 9 food waste
– Table 10 all waste types (please note that inert waste does not generate methane emissions)

Methane generation values (in tonnes per year) were converted to carbon dioxide equivalent (as tonnes CO_2e per year) by applying a 100-year warming factor of 25 (for methane).

For landfills without landfill gas collection and control systems, methane emissions are calculated using an oxidation factor shown in Equation 3:

$$MG = G_{CH4} * (1 – OX) \quad (3)$$

where,

MG = methane generation, after adjustment for oxidation (metric tonnes CH_4)

G_{CH4} = modelled methane generation rate in reporting year, calculated from Equation 1 (metric tonnes CH_4)

OX = Oxidation fraction

This equation accounts for methane that is oxidized upon diffusion through the soil cover. Table 11 presents the estimated peak methane emissions from the Brooks Road Landfill when accounting for soil cover oxidation. Therefore, without an LFG collection and control system, peak methane emissions from the Brooks Road Landfill (in 2026) are estimated to be approximately 902 tonnes of methane (approximately 22,540 tonnes CO_2e). Converting to units of flow, the maximum methane generation rate is approximately 152 cubic metres per hour (m^3/hr) (90 standard cubic feet per minute [scfm]) in 2026.

Figure 1 presents the projected methane generation for the Brooks Road Landfill. This figure provides total generation quantities prior to cover oxidation. This figure was produced by utilizing the USEPA LandGEM model upon which the first-order Scholl Canyon model used in Ontario for estimating landfill gas volumes is based.

Modelling Methane Generation – With Gas Collection and Control System

The total proposed capacity of the landfill is 1,264,465 m^3. In accordance with Ontario Regulation (O. Reg. 347) Section 11.1(2) all landfills in Ontario meeting the following criteria are required to install facilities for the collection and the burning or use of LFG generated by the site during operation of the site and during site closure if:

– The site accepts only MSW
– On or after June 30, 2009, the site will landfill waste under a certificate of approval (C of A) or provisional C of A issued under Part V of the EPA (now referred to as an Environmental Compliance Approval [ECA])
– On or after June 30, 2009, the site will have a total waste disposal volume of more than 1.5 million m^3

As an operating landfill not meeting the above criteria, the Site is not required to install LFG collection or control facilities, either at the current capacity of the proposal expanded capacity.

Notwithstanding the above, ECCC has recently issued a proposed regulatory framework entitled “Reducing Canada’s Landfill Methane Emissions” (PRF), inviting interested parties to provide their feedback on the PRF (feedback closure date of May 19, 2023). The PRF seeks to require landfills exceeding either a methane generation or a methane emission threshold to comply with regulatory requirements for controlling methane emissions. A tiered approach to identifying specific regulatory obligations is proposed that generally includes:

– Applicability threshold based on quantity of MSW disposed
– Methane generation assessment and threshold
– Methane emission assessment and thresholds (optional approach)

The PRF indicates that this approach is in line with the way other North American jurisdictions have identified which landfills are required to take action to reduce methane emissions. The regulation would apply to landfills that have received more than a specified quantity of MSW, i.e., waste generated by the residential, industrial, commercial and institutional (ICI), and construction, renovation and demolition (CRD) sectors. ICI sector waste is defined as waste from sources like office buildings, shopping malls, schools and hospitals. As proposed, the regulations would apply to landfills that meet the following criteria:

– Closed landfills that accepted MSW for disposal after January 1, 2009 and that have more than 450,000 tonnes of MSW in place (total waste disposed)

– Open landfills that:
  - Have more than 100,000 tonnes of MSW in place or
  - Accepted more than 10,000 tonnes of MSW for disposal per year in any year following the coming into force of the regulations

Landfills that meet these criteria would have requirements under the regulation. Some landfills would only be required to do minimal assessment, while others may have further obligations based on the results of the assessment.

As this Site currently has more than 100,000 tonnes of MSW or bulk waste in place this section will consider the environmental, energy, and economic impacts associated with the operation of a landfill gas collection and control system.

To determine the effectiveness of the system, the estimated methane emission reduction was calculated. In accordance with Table HH-3 of 40 CFR 98, Subpart HH, a gas collection recovery factor of 60 percent was assumed as most of the Site currently has daily cover (see Table 11). The methane that is generated in the landfill and not recovered by the collection system is given an oxidation factor. A destruction efficiency is applied to the methane that is recovered by the collection system (the lesser of 99 percent and the manufacturer's specified destruction efficiency). Equation 4 is used to calculate total annual methane emissions:

$$E_{CH4} = [(G_{CH4} – R) * (1 – OX)] + [R * (1 – (DE * f_{dest}))] \qquad (4)$$

Where:

– E_{CH4} = Methane emissions from landfill (metric tonnes CH_4)
– R = Quantity of recovered CH_4 in collection system [R= Collection Efficiency (%) * G_{CH4}]
– OX = Oxidation fraction
– DE = Destruction efficiency
– f_{dest} = fraction of hours the control device was operating (annual operating hours/8,760 hours per year). If the gas is destroyed in a back-up flare (or similar device) or if the gas is transported off-site for destruction, use f_{dest} = 1

Figure 2 presents the projected methane collection for the Site. Table 12 presents a summary of the methane emissions for each option (Option 1: No Collection System, Option 2: With Gas Collection System), as well as the estimated methane reduction by going forward with Option 2. It is assumed that the only feasible control option is an open/utility flare since the Site does not generate enough gas to support an enclosed flare.

Gas Collection and Control System – Environmental Impacts

In an open/utility flare, LFG is burned in the elevated flare tip located at the top of the gas flare stack. Commonly the flame is open at the top of the gas flare stack and hence the name. Due to the open flame, this type of flare system can be a source of noise. Also, the radiant heat from open flame renders some area around the stack unsuitable for installation of some equipment.

Gas Collection and Control System – Energy Impacts

An active gas collection system would require the operation of a blower system. In addition, the open flare would require a fuel source for startup. An active collection and control system would also require much more monitoring and maintenance, which would result in more vehicle traffic to and from the Site. All the aforementioned items would be a source of GHG emissions which would partially offset any methane reduction that is achieved by a gas collection and control system.

Gas Collection and Control System – Economic Impacts

The average annual costs (capital and operating) associated with the operation of a utility flare and a gas collection system over a 25-year period is presented in Tables 13 and 14, respectively. The total annual cost for the operation of a gas collection and control system is estimated to be $334,000 per year. The average annual methane emission reduction for the period of 2026-2050 is estimated to be 8,118 tonnes CO_2e per year. Therefore, the cost effectiveness with this option is estimated to be $41 per tonne CO_2e reduced. Historically, when evaluated based on Ontario's discontinued Cap-and-Trade system, the threshold for determining if a project is cost effective was in the range of $3-$15 per tonne CO_2e reduced (for GHG). Based on this, the operation of a gas collection and control system at the Brooks Road Landfill is not considered cost-effective. Consideration can be given to credits that would be generated under the ECCC's Clean Fuel Regulations (CFR), though it is unclear if the ECCC's PRF would remove eligibility for generation of credits under the CFR.

Simulation 2 – Model Based on Parameters from ECCC's National Inventory Report 1990-2018: Greenhouse Gas Sources and Sinks in Canada

Modelling Methane Generation – No Gas Collection System

GHD prepared a second model simulation in which DOC and k values were referenced from the document "*National Inventory Report 1990 – 2018: Greenhouse Gas Sources and Sinks in Canada*", dated 2020. Table A3.6-4 from Part 2 provides average DOC and k values broken down by provinces within Canada. For Ontario, a DOC value of 0.21 is specified for the period of 2002-2014 and a DOC value of 0.18 is specified for 2015 to present. Table A3.6-5 specifies a k value of 0.045 yr^{-1} for Ontario for the period of 2008 to present. These model parameters are only being applied to the putrescible waste accepted at the Site, defined as the total waste minus inert waste categories shown in Table 3.

The estimated methane generation in the peak year (2026) is shown in the following tables:

– Table 15 presents the estimated peak methane generation for the putrescible waste accepted in 2009 through 2014
– Table 16 presents the estimated peak methane generation for the putrescible waste accepted in 2015 through 2026
– Table 17 presents the estimated peak methane generation for all wasted types combined (please note that inert waste does not generate methane emissions)

Methane generation values (in tonnes per year) were converted to carbon dioxide equivalents (as tonnes CO_2e per year) by applying a 100-year warming factor of 25 for methane.

Table 18 presents the estimated peak methane emissions from the Site when accounting for soil cover oxidation. Therefore, without an LFG collection and control system, peak methane emissions from the Site in 2026 are estimated to be approximately 1,525 tonnes of methane (approximately 38,117 tonnes CO_2e). Converting to units of flow, the maximum methane generation rate is approximately 257 m^3/hr (152 scfm) in 2026.

Figure 3 presents the projected methane generation for the Site. This figure provides total generation quantities prior to cover oxidation. This figure was produced by utilizing the USEPA LandGEM model.

Modelling Methane Generation – With Gas Collection and Control System

This section presents a discussion of the impacts associated with the operation of a gas collection and control system. The environmental, energy, and economic impacts were evaluated for the installation of a gas collection and control system at the Site.

To determine the effectiveness of the system, the estimated methane emission reduction was calculated. In accordance with Table HH-3 of 40 CFR 98, Subpart HH, a gas collection recovery factor of 60 percent was assumed as most of the Site currently has daily cover (see Table 18). The methane that is generated in the landfill and not recovered by the collection system is given an oxidation factor. A destruction efficiency is

applied to the methane that is recovered by the collection system (the lesser of 99 percent and the manufacturer's specified destruction efficiency).

Figure 4 presents the projected methane collection for the Site. Table 19 presents a summary of the methane emissions for each option (Option 1: No Collection System, Option 2: With Gas Collection System), as well as the estimated methane reduction by going forward with Option 2. It is assumed that the only feasible control option is an open/utility flare since the Site does not generate enough gas to support an enclosed flare.

Gas Collection and Control System – Environmental Impacts

In an open/utility flare, LFG is burned in the elevated flare tip located at the top of the gas flare stack. Commonly the flame is open at the top of the gas flare stack and hence the name. Due to the open flame, this type of flare system can be a source of noise. Also, the radiant heat from open flame renders some area around the stack unsuitable for installation of some equipment.

Gas Collection and Control System – Energy Impacts

An active gas collection system would require the operation of a blower system. In addition, the open flare would require a fuel source for startup. An active collection and control system would also require much more monitoring and maintenance, which would result in more vehicle traffic to and from the Site. All the aforementioned items would be a source of GHG emissions which would partially offset any methane reduction that is achieved by a gas collection and control system.

Gas Collection and Control System – Economic Impacts

The average annual costs (capital and operating) associated with the operation of a utility flare and a gas collection system over a 25-year period is presented in Tables 13 and 14, respectively. The total annual cost for the operation of a gas collection and control system is estimated to be $333,712 per year. The average annual methane emission reduction for the period of 2026-2050 is estimated to be 14,027 tonnes CO_2e per year. Therefore, the cost effectiveness with this option is estimated to be $24 per tonne CO_2e reduced. Historically, when evaluated based on Ontario's discontinued Cap-and-Trade system, the threshold for determining if a project is cost effective was in the range of $3 - $15 per tonne CO_2e reduced (for GHG). Based on this, the operation of a gas collection and control system at the Brooks Road Landfill is not considered cost-effective. Consideration can be given to credits that would be generated under the ECCC's CFR, though it is unclear if the ECCC's PRF would remove eligibility for generation of credits under the CFR.

Discussion/Conclusion

The estimated maximum landfill gas generation and methane generation quantities for the Site are shown in the table below (adjusted for cover oxidation):

	Maximum Generation – Simulation 1		Maximum Generation – Simulation 2	
	m^3/hr	cfm	m^3/hr	cfm
LFG	338.6	199.3	572.1	336.7
Methane	152.4	89.7	257.4	151.5

Based on an evaluation of the waste quantities shown in Table 2F, the landfill accepts mostly construction/demolition waste (~27 percent) and inert material (~65 percent). These waste categories contain a very low amount of DOC when compared to higher organic materials such as bulk waste and food waste. Therefore, the landfill is not expected to generate a large amount of methane emissions as a typical MSW landfill would.

GHD concludes that model Simulation 1 is more indicative of what is occurring at the Site since this scenario accounts for actual waste types accepted at the Site. Simulation 2 is based on estimated average DOC and k values collected across Canada (by province) and is more aligned with MSW sites that contain more organic waste than what is accepted at the Site. Brooks Road Landfill accepts ICI waste which generally contains less

degradable organic content than MSW. We should note that for both model simulations, the landfill is expected to generate less than 100,000 tonnes of carbon dioxide equivalent in the peak year of generation and a gas collection system is not considered feasible in either case.

It should be noted that the Site did accept waste prior to 2009. However, the Site does not have detailed waste records for years prior to 2009. Therefore, it is more conservative (i.e., biases landfill gas conservatively high) to start the modelling analysis in 2009 using a fixed design capacity of 624,065 tonnes for the existing landfill. By employing a fixed design capacity of 624,065 tonnes, the waste is assumed to be deposited in the landfill sooner than it was and is expected to produce more gas in the present time than older waste.

Based on the relatively low levels of methane expected to be generated at the Brooks Road Landfill and the lack of regulatory or economic drivers associated with the installation of a gas collection and control system, it is not recommended to install such a system at this time. The installation of a gas collection or control system will need to be revisited should ECCC adopt the PRF put out for public comment this year.

Regards,

Bryan Szalda

Modelling Parameters
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Factor	Default value	Units
DOC and k values—Bulk waste option		
DOC (bulk waste)	0.2	Weight fraction, wet basis.
k (precipitation plus recirculated leachate[(a)] <20 inches/year)	0.02	yr^{-1}
k (precipitation plus recirculated leachate[(a)] 20-40 inches/year)	0.038	yr^{-1}
k (precipitation plus recirculated leachate[(a)] >40 inches/year)	0.057	yr^{-1}
DOC and k values—Modified bulk MSW option		
DOC (bulk MSW, excluding inerts and C&D waste)	0.31	Weight fraction, wet basis.
DOC (inerts, e.g., glass, plastics, metal, concrete)	0	Weight fraction, wet basis.
DOC (C&D waste)	0.08	Weight fraction, wet basis.
k (bulk MSW, excluding inerts and C&D waste)	0.02 to 0.057[(b)]	yr^{-1}
k (inerts, e.g., glass, plastics, metal, concrete)	0	yr^{-1}
k (C&D waste)	0.02 to 0.04[(b)]	yr^{-1}
DOC and k values—Waste composition option		
DOC (food waste)	0.15	Weight fraction, wet basis.
DOC (garden)	0.2	Weight fraction, wet basis.
DOC (paper)	0.4	Weight fraction, wet basis.
DOC (wood and straw)	0.43	Weight fraction, wet basis.
DOC (textiles)	0.24	Weight fraction, wet basis.
DOC (diapers)	0.24	Weight fraction, wet basis.
DOC (sewage sludge)	0.05	Weight fraction, wet basis.
DOC (inerts, e.g., glass, plastics, metal, cement)	0	Weight fraction, wet basis.
k (food waste)	0.06 to 0.185[(c)]	yr^{-1}
k (garden)	0.05 to 0.10[(c)]	yr^{-1}
k (paper)	0.04 to 0.06[(c)]	yr^{-1}
k (wood and straw)	0.02 to 0.03[(c)]	yr^{-1}
k (textiles)	0.04 to 0.06[(c)]	yr^{-1}
k (diapers)	0.05 to 0.10[(c)]	yr^{-1}
k (sewage sludge)	0.06 to 0.185[(c)]	yr^{-1}
k (inerts e.g., glass, plastics, metal, concrete)	0	yr^{-1}
Other parameters—All MSW landfills		
Methane Correction Factor, MCF	1	
Fraction of DOC Dissimilated, DOC_F	0.5	
Fraction by volume of CH4 in landfill gas from measurement data, if available, F	0.5	
Oxidation Fraction, OX	See Table HH-4 of this subpart	
Destruction Efficiency, DE	0.99	

Notes:

Source: 40 CFR 98 Subpart HH, Table HH-1
DOC - degradable organic carbon

k - decay rate constant

a. Recirculated leachate (in inches/year) is the total volume of leachate recirculated from company records or engineering estimates divided by the area of the portion of the landfill containing waste with appropriate unit conversions. Alternatively, landfills that use leachate recirculation can elect to use the k value of 0.057 rather than calculating the recirculated leachate rate.

b. Use the lesser value when precipitation plus recirculated leachate is less than 20 inches/year. Use the greater value when precipitation plus recirculated leachate is greater than 40 inches/year. Use the average of the range of values when precipitation plus recirculated leachate is 20 to 40 inches/year (inclusive). Alternatively, landfills that use leachate recirculation can elect to use the greater value rather than calculating the recirculated leachate rate.

c. Use the lesser value when the potential evapotranspiration rate exceeds the mean annual precipitation rate plus recirculated leachate. Use the greater value when the potential evapotranspiration rate does not exceed the mean annual precipitation rate plus recirculated leachate. Alternatively, landfills that use leachate recirculation can elect to use the greater value rather than assessing the potential evapotranspiration rate or recirculated leachate rate.

1,045,065 m^3	219,400 m^3	1,264,465 m^3

Notes:
Waste for the years 2009 to 2016 is an average of the Material Activity Report for the period of October 8, 2009 to October 9, 2016.
1. Includes 50,000 cubic metres of relocated waste from decommissioned Original Landfill Area. Due to the composition and age of this waste, it is assumed to be inert material with respect to current waste stream.
2. Actual waste totals used through **2022** (based on material reports in Attachment 1).
3. Projected waste totals for future years (**2023** to closure) based on percentages calculated in Table 2F for each waste type and a density of 1.956 tonnes per cubic metre.

Table 4

Methane Generation Model Input Values - Simulation 1
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Enter the Landfill Open Year:	2009
Enter the Peak Year:	2026

Step 1 - Selection of rate constant (k) for bulk waste

		Bulk Waste k (yr^{-1})	C&D k (yr^{-1})
Option 1:	Mean annual precipitation less than 20 inches/year and landfill does not practice leachate recirculation	0.02	0.02
Option 2:	Mean annual precipitation between 20 - 40 inches/year and landfill does not practice leachate recirculation	0.038	0.03
Option 3:	Mean annual precipitation greater than 40 inches/year or landfill does practice leachate recirculation	0.057	0.04

Select option using criteria above (Enter 1, 2, or 3): **2**

Step 2 - Selection of rate constants (k) for categorized wastes

Waste Type	Option 1: Potential evapotranspiration rate exceeds mean annual precipitation and no leachate recirculation at landfill **k (yr^{-1})**	Option 2: Mean annual precipitation exceeds potential evapotranspiration rate or landfill practices leachate recirculation **k (yr^{-1})**
Food Waste	0.06	0.185
Garden Waste	0.05	0.1
Paper Waste	0.04	0.06
Wood & Straw	0.02	0.03
Textiles	0.04	0.06
Diapers	0.05	0.1
Sewage Sludge	0.06	0.185

Select option using criteria above (Enter 1 or 2): **2**

Step 3 - Selection of methane concentration (F) for landfill gas

If measured methane concentration is available, enter value as a percent by volume; if measured methane concentration is not available, use default value of 50%

Select methane concentration (F) using criteria above: **50** **%**

Notes:
DOC and k parameters above referenced from 40 CFR 98 Subpart HH, Table HH-1

Table 11

Methane Generation Adjusted for Methane Oxidation - Simulation 1
Predicted Methane Generation
Brooks Landfill Site, Cayuga, Ontario
Brooks Road Environmental

Calculation of methane generation, adjusted for oxidation, from the modelled CH_4, using Equation HH-5

$$MG = G_{CH\,4} * (1 - OX)$$

G_{CH4} =	Modelled methane generation rate =	1,001.8	tonnes CH_4 in 2026
SArea =	Surface area of the landfill =	60,703	square metres
MF =	Methane flux rate from the landfill =	45	g/m^2/day
OX =	Oxidation fraction =	0.1	(Landfill has 1 foot of interim cover; 6" of daily cover, option C4)

MG = 901.6 tonnes CH_4

MG = 22,540.2 tonnes CO_2 equivalent

Table HH-4 to Subpart HH of Part 98—Landfill Methane Oxidation Fractions

Under these conditions:	Use this landfill methane oxidation fraction:
I. For all reporting years prior to the 2013 reporting year	
C1: For all landfills regardless of cover type or methane flux	0.10
II. For the 2013 reporting year and all subsequent years	
C2: For landfills that have a geomembrane (synthetic) cover with less than 12 inches of cover soil for the majority of the landfill area containing waste	0.0
C3: For landfills that do not meet the conditions in C2 above, and for which you elect not to determine methane flux	0.10
C4: For landfills that do not meet the conditions in C2 above and that do not have a soil cover of at least 24 inches for a majority of the landfill area containing waste	0.10
C5: For landfills that have a soil cover of at least 24 inches for a majority of the landfill area containing waste and for which the methane flux rate is less than 10 grams per square meter per day ($g/m^2/d$)	0.35
C6: For landfills that have a soil cover of at least 24 inches for a majority of the landfill area containing waste and for which the methane flux rate is 10 to 70 $g/m^2/d$	0.25
C7: For landfills that have a soil cover of at least 24 inches for a majority of the landfill area containing waste and for which the methane flux rate is greater than 70 $g/m^2/d$	0.10

[a]Methane flux rate (in grams per square meter per day; $g/m^2/d$) is the mass flow rate of methane per unit area at the bottom of the surface soil prior to any oxidation and is calculated as follows:

Table 12

Cost Analysis - Utility Flare - Simulation 1
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Capital Costs

Direct Costs		
Utility Flare	$100,000	(estimated)
(includes enclosed stack, control panel/ instrumentation, and blower skid/ mechanical components)		
Auxiliary Equipment	$6,000	(6% of Flare System Costs)
Equipment Cost ($) ……	$106,000	
Sales Tax	$3,180	(3% of Equipment Cost)
Freight	$5,300	(5%of Equiment Cost)
Purchased Equipment Cost (PEC) ($) ……	$114,480	
Direct Installation Costs		
Foundations & Supports	$13,738	12% of PEC
Handling & Erection	$45,792	40% of PEC
Electrical	$1,145	1% of PEC
Piping	$2,290	2% of PEC
Insulation	$1,145	1% of PEC
Painting	$1,145	1% of PEC
Direct Installation Cost ($)	$65,254	
Site Preparation	$0	
Facilities & Buildings	$0	
Total Direct Costs, DC ($) ……	$179,734	
Indirect Costs, IC		
Engineering	$11,448	10% of PEC
Construction and Field Expenses	$11,448	10% of PEC
Contractor Fees	$11,448	10% of PEC
Start-up	$1,145	1% of PEC
Performance Test	$1,145	1% of PEC
Contingencies	$3,434	3% of PEC
Total Indirect Costs, IC	$40,068	
Total Capital Investment (TCI) ($) ……	$219,802	

Cost Analysis - Utility Flare - Simulation 1
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Annual Cost Inputs

Operating factor (hr/yr):		8,760	100% operation capacity
Annual interest rate (fraction):		0.05	
Project life (years):		30	
Capital recovery factor:		0.06505	
Flare Operator Labor Rate	$	30.00	/ hour
Maintenance Labor Rate	$	33.00	/ hour

Direct Annual Costs

Operator labor costs	$18,900	630 hours/year
Supervisor	$2,835	(15% of Operator labor)
Maintenance Labor	$18,068	(0.5 hr per shift)
Maintenance Materials	$18,068	(100% of Maintenance Labor)
Utilities		
Electricity	$33,328	(30 hp blower; $0.17/kw-hr)
Propane	$1,000	(estimated)

Total Direct Costs, DC ($) …… $92,198

Indirect Annual Costs, IC

Overhead	$34,722	(60% of labor % material costs)
Administrative Charges	$4,396	2% of TCI
Property Tax	$2,198	1% of TCI
Insurance	$2,198	1% of TCI
Capital Recovery	$14,298	

Total Indirect Costs, IC ($) …… $57,812

Total Annual Costs ($) …… $150,011

Notes:
Cost assumptions and recommendations were referenced from the EPA Air Pollution Cost Control Manual, Sixth Edition (January 2002).

Table 14

Cost Analysis - Installation of Gas Collection System - Simulation 1
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Capital Costs

Direct Costs		
Installation of Gas Collection System	$450,000	($30,000 per acre)
Equipment Cost ($) ……	$450,000	
Sales Tax	$13,500	(3% of Equipment Cost)
Freight	$22,500	(5% of Equiment Cost)
Purchased Equipment Cost (PEC) ($) ……	$486,000	
Direct Installation Costs		
Foundations & Supports	$58,320	12% of PEC
Handling & Erection	$194,400	40% of PEC
Electrical	$4,860	1% of PEC
Piping	$9,720	2% of PEC
Insulation	$4,860	1% of PEC
Painting	$4,860	1% of PEC
Direct Installation Cost ($)	$277,020	
Site Preparation	$0	
Facilities & Buildings	$0	
Total Direct Costs, DC ($) ……	$763,020	
Indirect Costs, IC		
Engineering	$48,600	10% of PEC
Construction and Field Expenses	$48,600	10% of PEC
Contractor Fees	$48,600	10% of PEC
Start-up	$4,860	1% of PEC
Performance Test	$4,860	1% of PEC
Contingencies	$14,580	3% of PEC
Total Indirect Costs, IC	$170,100	
Total Capital Investment (TCI) ($) ……	$933,120	

Cost Analysis - Installation of Gas Collection System - Simulation 1
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Annual Cost Inputs

Operating factor (hr/yr):	8,760	100% operation capacity
Annual interest rate (fraction):	0.05	
Project life (years):	30

Methane Generation Model - Totals - Simulation 2
Predicted Methane Generation
Brooks Road Landfill, Cayuga, Ontario
Brooks Road Environmental

Landfill Year Open: 2009
Reporting Year: 2026

Waste Type	2026 CH_4 Generation (tonnes)
2009-2014	433
2015-2024	1,261

Total 2026 CH_4 Generated (tonnes): 1,694
Total 2026 CO_2 Equivalents Generated (tonnes): 42,352

Threshold (tonnes): 100,000

Notes:
Methane generation from food waste based on calculation methodology in 40 CFR 98.343(a)(1). This table provides aggregate of all waste types.

Table 18

Methane Generation Adjusted for Methane Oxidation - Simulation 2
Predicted Methane Generation
Brooks Landfill Site, Cayuga, Ontario
Brooks Road Environmental

Calculation of methane generation, adjusted for oxidation, from the modelled CH_4, using Equation HH-5

$$MG = G_{CH\,4} * (1 - OX)$$

G_{CH4} =	Modelled methane generation rate =	1,694.1	tonnes CH_4 in 2026
SArea =	Surface area of the landfill =	60,703	square metres
MF =	Methane flux rate from the landfill =	76	g/m^2/day
OX =	Oxidation fraction =	0.1	(Landfill has 1 foot of interim cover; 6" of daily cover, option C4)

MG = 1,524.7 tonnes CH_4

MG = 38,116.8 tonnes CO_2 equivalents

Table HH-4 to Subpart HH of Part 98—Landfill Methane Oxidation Fractions

Under these conditions:	Use this landfill methane oxidation fraction:
I. For all reporting years prior to the 2013 reporting year	
C1: For all landfills regardless of cover type or methane flux	0.10
II. For the 2013 reporting year and all subsequent years	
C2: For landfills that have a geomembrane (synthetic) cover with less than 12 inches of cover soil for the majority of the landfill area containing waste	0.0
C3: For landfills that do not meet the conditions in C2 above, and for which you elect not to determine methane flux	0.10
C4: For landfills that do not meet the conditions in C2 above and that do not have a soil cover of at least 24 inches for a majority of the landfill area containing waste	0.10
C5: For landfills that have a soil cover of at least 24 inches for a majority of the landfill area containing waste and for which the methane flux rate is less than 10 grams per square meter per day ($g/m^2/d$)	0.35
C6: For landfills that have a soil cover of at least 24 inches for a majority of the landfill area containing waste and for which the methane flux rate is 10 to 70 $g/m^2/d$	0.25
C7: For landfills that have a soil cover of at least 24 inches for a majority of the landfill area containing waste and for which the methane flux rate is greater than 70 $g/m^2/d$	0.10

List of Appendices

1. Introduction

1.1 Purpose and Background

This document describes the Complaint Protocol prepared in accordance with Condition No. 6 of the Minister of Environment, Conservation and Parks' (Minister) Notice of Approval to Proceed with the Undertaking. The Minister approved the EA for the Brooks Road Landfill Site Vertical Capacity Expansion on February 14, 2019.

The Notice of Approval, issued under Section 9 of the *Environmental Assessment Act*, gives Brooks Road the approval to proceed with the proposed vertical expansion of the waste disposal capacity of the Brooks Road Landfill Site, subject to the conditions set out in it. With this in mind, the Minister's Notice of Approval specified the following compliance monitoring and reporting related conditions:

6. Complaints Protocol

6.1 The Proponent shall prepare and Implement a complaint protocol that sets out provisions for dealing with and responding to inquiries and complaints during all stages of the Undertaking. The complaint protocol shall include a procedure for notifying the Ministry's Hamilton District Office for the complaints received.

6.2 The Proponent shall submit the complaint protocol to the Director for approval and for the public record within one year from the Date of Approval, or 60 days before the start of Construction, whichever is earlier, or by another date agreed upon by the director.

6.3 The Director may require the Proponent to amend the complaint protocol at any time. Should an amendment be required, the Director shall notify the proponent in writing of the amendment required and when the amendment must be completed.

6.4 The Proponent shall submit the amended complaint protocol to the Director within the time period specified by the Director.

6.5 The Proponent shall implement the complaint protocol and any amendments to it.

6.6 The Proponent shall provide a summary on the complaints received and how they were addressed as part of the annual compliance reporting (Condition 5) and post the summary on the website as part of the public record.

In addition, the following conditions are included in the Amended Environmental Compliance Approval No. A110302:

9. Complaints Response Procedure

(1) If at any time the Owner receives complaints regarding the operation of the Site, the Owner shall respond to these complaints according to the following procedure:

a. The Owner shall record and number each complaint, either electronically or in a log book, and shall include the following information: the nature of the complaint, the

name, address and the telephone number of the complainant if the complainant will provide this information and the time and date of the complaint;

b. The Owner, upon notification of the complaint, shall initiate appropriate steps to determine possible causes of the complaint, proceed to take the necessary actions to eliminate the cause of the complaint. When possible, the Owner will forward a written reply to the complainant; and

c. The Owner shall complete and retain on-site a report written within one (1) week of the complaint date, listing the actions taken to resolve the complaint and any recommendations for remedial measures, and managerial or operational changes to reasonably avoid the recurrence of similar incidents.

11. Public Liaison Committee (PLC)

(1) The Owner/Operator shall maintain and participate in a landfill PLC, which shall function in accordance with the Terms of Reference for the PLC, as amended from time to time. Any amendment to the Terms of Reference must be approved by the District Manager. The PLC shall serve as a forum for dissemination, consultation, review and exchange of information regarding the operation of the landfill Site, including environmental monitoring, maintenance, complaint resolution, and new approvals or amendments to existing approvals related to the operation of this landfill Site.

With these EA and ECA conditions in mind, Section 2 provides details on the complaints procedure that is in place at the Site, including complaint documentation and issues resolutions mechanisms, and Section 3 outlines the complaint reporting process.

2. Complaints Procedure

The purpose of this procedure is to establish a clear process for residents to voice any concerns they may have with respect to operating issues at the Site. This Public Complaint Procedure is an update to the currently approved procedure dated December 2004. The following steps outline the various avenues the public may follow to lodge any complaint resulting from operations at the Site:

1. During regular hours of operation, 7:00 am to 5:00 pm (Monday to Friday) any complaints should be made directly to the Site by calling 1-888-40-BRENV (27368) or 416-389-8876. The Site Supervisor on duty at the time will ensure the issue is dealt with immediately. Alternatively, complainants may choose to visit the Site in person and speak directly to the Site Supervisor during the above noted regular hours, provided the Site is not closed between these hours. Upon entering the Site, the complainant shall check-in at the scale house.
2. Outside regular hours of operation, a voice message can be left at 1-888-40-BRENV (27368) or 416-389-8876. In cases of emergency, residents should call 911 so that appropriate action(s) can be taken
3. When making a complaint, residents should be prepared to provide the following information

    i) Date and time

ii) Resident's name

iii) Resident's address

iv) Location relative to the Site

v) Contact information (email address is preferred for follow-up purposes)

vi) Nature of the complaint

vii) Weather conditions at the time of the complaint

Each complaint will be assigned a unique identifier for tracking purposes. The unique identifier will include the date and the complaint number.

Weather conditions will be documented to determine if the weather was a contributing factor to the complaint (e.g., litter impacts can be associated with periods of high winds, or odour impacts can be associated with overcast periods with little wind). The weather condition information at the time of the complaint will be taken from the Environment Canada – Hamilton A station.

In the event of receipt of a complaint related to odour, BRE personnel will travel to the location of the odour complaint (or the nearest accessible location) to assess for the presence of odour. BRE personnel will then trace back toward the Site and complete a perimeter inspection for the presence of odour. This inspection will be in addition to any daily inspections already carried out by BRE. The purpose will be to determine if odour is coming from the Site and to determine the potential on-Site source. If odour is confirmed to originate from the Site, per Condition 3(29) of ECA No. A110302, BRE will initiate mitigation measures in accordance with the Odour Management Plan. Mitigation measures to be implemented are specific to the source of on-Site odour.

Complaint forms will be completed and logged by Brooks Road Environmental (BRE) when a complaint has been received. This will be undertaken for all complaints, whether written or verbal. The complaint form template is provided in Appendix A. This form can be used for the different types of complaints received, such as dust, noise, or other, in addition to odour complaints. As the potential for dust, noise or other complaints at locations away from BRE are minimal the complaint investigation would be focused on the BRE operations. These forms will provide a record to be kept on file, along with copies of any correspondence to, or discussion with, the complainant. Upon request, members of the Public Liaison Committee (PLC) will receive a copy of each complaint.

BRE will ensure the Ministry of Environment, Conservation, and Parks (MECP) is notified within two business days of each complaint.

A response will be made to the complainant by the end of the next business day (from the day that BRE receives the complaint) confirming the receipt of the complaint, the nature of the complaint, and results of any follow-up. If the complaint cannot be resolved within a reasonable time period, the complainant will be notified of the action to be taken.

Appropriate signage will be placed at the Site entrance/exit indicating the overview of the Public Complaint Procedure, including the phone number for registering any complaint. Phone numbers for

the MECP Hamilton District Office and Haldimand County By-law enforcement will also be included on the signs.

MECP Hamilton District Office: Taylor Buck, 365-336-7491	Haldimand County By-law Enforcement Caledonia Office, 905-318-5932

3. Complaint Reporting

All complaints will be reviewed on an annual basis and summarized in the Annual Monitoring Report. BRE will be responsible to ensure that the following is undertaken and documented:

- Circulating all complaints to members of the PLC, MECP Hamilton District Office and Haldimand County prior to each PLC meeting, and keeping a public record at the Owner offices. Copies of complaint forms will be available at the Site office.
- Reviewing with the PLC and County all complaints received and Owner's response/ action at each PLC meeting.
- Provide a summary of complaints received and how they were addressed as part of the Annual Compliance Report and posting that summary on the website, as per EA Condition of Approval 6.6

Appendices

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown in Figure 1.1.

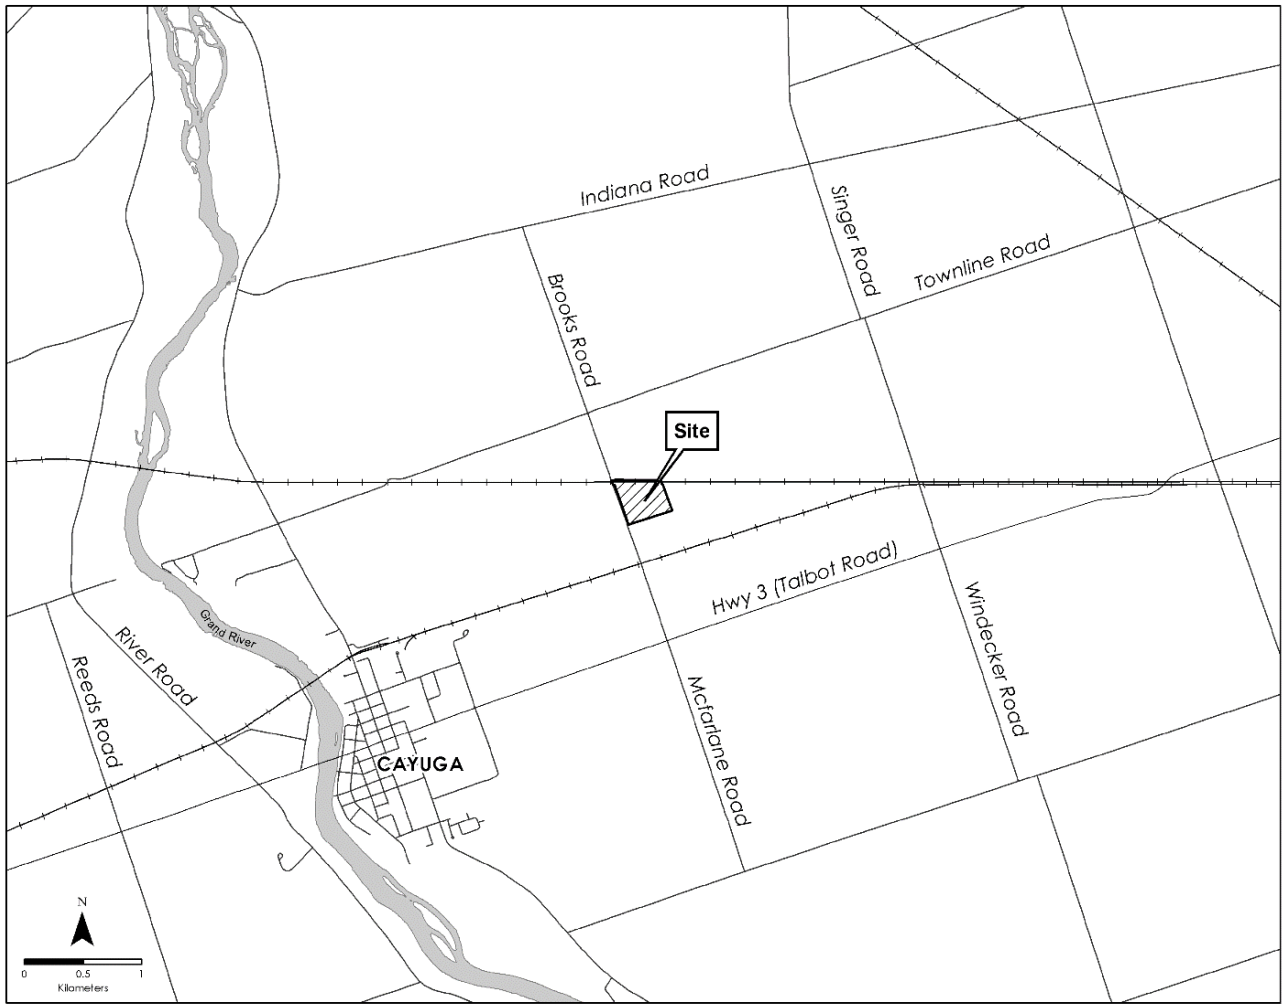

Figure 1.1 Location of the Proposed Undertaking

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (Landfill ECA), has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA) and industrial sewage works ECA No. 1122-BKUPSM (Industrial Sewage ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an

amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customer for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by 219,400 m^3, adding capacity for approximately two years. This expansion will be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (an increase in the peak elevation to 225.66 mAMSL including final cover), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown in Figure 1.2.

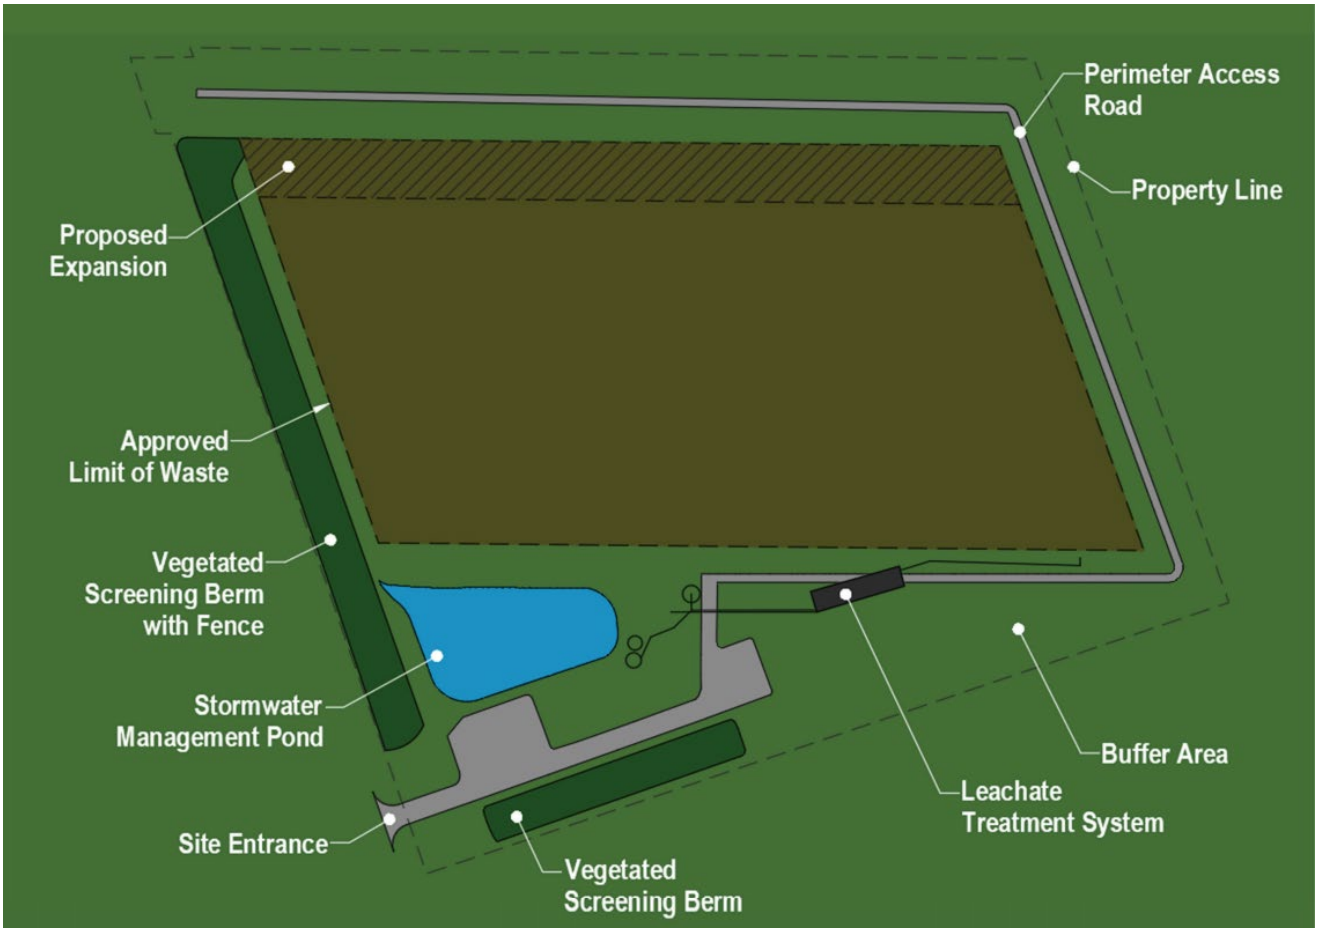

Figure 1.2 Proposed Capacity Expansion Concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:

1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302.

GHD has prepared a Noise assessment on behalf of BRE for the proposed undertaking. This report documents the following as it relates to the Noise environment:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project)
– Potential effects on the environment, mitigation measures, and net effects
– Future monitoring requirements to be implemented

The Study Areas reviewed for the Noise assessment were as follows (see Figure 1.3):

– **Site Study Area (SSA)** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– **Local Study Area (LSA)** – the area within the vicinity of the Site extending approximately 1,000 m in all directions

The Study Area is rural in character and surrounded by agricultural fields. There are no existing industries within the Study Area other than the Facility that may contribute to the background noise levels. The nearest residential dwelling is approximately 232 m northwest of the existing property boundary. There are approximately 14 existing one-storey (1.5 m above grade) and two-storey (4.5 m above grade) residential dwellings within the Study Area.

Figure 1.3 Noise Study Area

2. Screening Criteria Checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act.*

As noted in the Guide:

"*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required. Where a "yes" has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion*."

Each criterion is based on a question which is prefaced with the phrase, "*Might the Project*…" Table 2.1 was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Noise discipline. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in Section 4 of this report.

Table 2.1 Screening Criteria Checklist

	Might the project…			
3. Air and Noise				
3.4	Cause negative effects from the emission of noise?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in noise emissions associated with continued operation of the Site.

3. Existing Conditions

The following subsections describe the existing conditions that are found within the SSA and LSA of the proposed project.

3.1 Methodology

3.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Noise Study Team to determine existing Noise conditions within the Study Areas. The following sources of secondary information were collected and reviewed:

- Review of Historic Noise Complaints
- Review of current zoning plans, definitions and land use designations
- Field Observations and Investigations
- Review of local traffic data
- MECP technical guidelines and standards
- March 27, 2020 Amended Environmental Compliance Approval #A110302
- Design and Operations Report Vertical Expansion – Rev. 1, Brooks Road Landfill Site, 2270386 Ontario Inc., Prepared by GHD, June 15, 2021
- Acoustic Assessment Report (AAR) and Best Management Practices Plan (BMP) for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment, Prepared by GHD, June 14, 2021

3.1.2 Process Undertaken

GHD has describe the processes and steps taken in chronological order as required to best describe the methodology used for this assessment.

3.1.3 Historic Noise Complaints

Brooks Road Landfill has not received any formal noise complaints for the previous operations on-site after a review of all formal complaint records provided since September 2015 which is based on the records provided by BRE Site operators. During a recent open house event in June of 2022 one written comment from a local resident was received indicating that there was a concern with the noise from tracked vehicles.

3.1.4 Review of Zoning

The Comprehensive Zoning By-Law for Haldimand County identifies the Site as "MD – Disposal Industrial Zone," which is suitable for a municipal sanitary landfill site. The surrounding land uses are zoned Agricultural use.

A zoning map is provided in Appendix A.

3.1.5 Site Review

Previous data collected during the Vertical Capacity Expansion EA and Fill Rate Amendment was reviewed. The Study Area is rural in character and surrounded by agricultural fields. There are no existing industries within the Study Area other than the Facility that may contribute to the background noise levels.

During the Vertical Capacity Expansion EA, a Site visit was conducted for the purpose of determining noise impact exposure off-Site. Off-Site residential dwelling locations were reviewed and the height of structures for noise impact exposure analysis was determined.

The nearest residential dwelling is approximately 232 metres (m) northwest of the existing property boundary. There are approximately 14 existing one-storey (1.5 m above grade) and two-storey (4.5 m above grade) residential dwellings within the Study Area as identified on Figure 3.1.

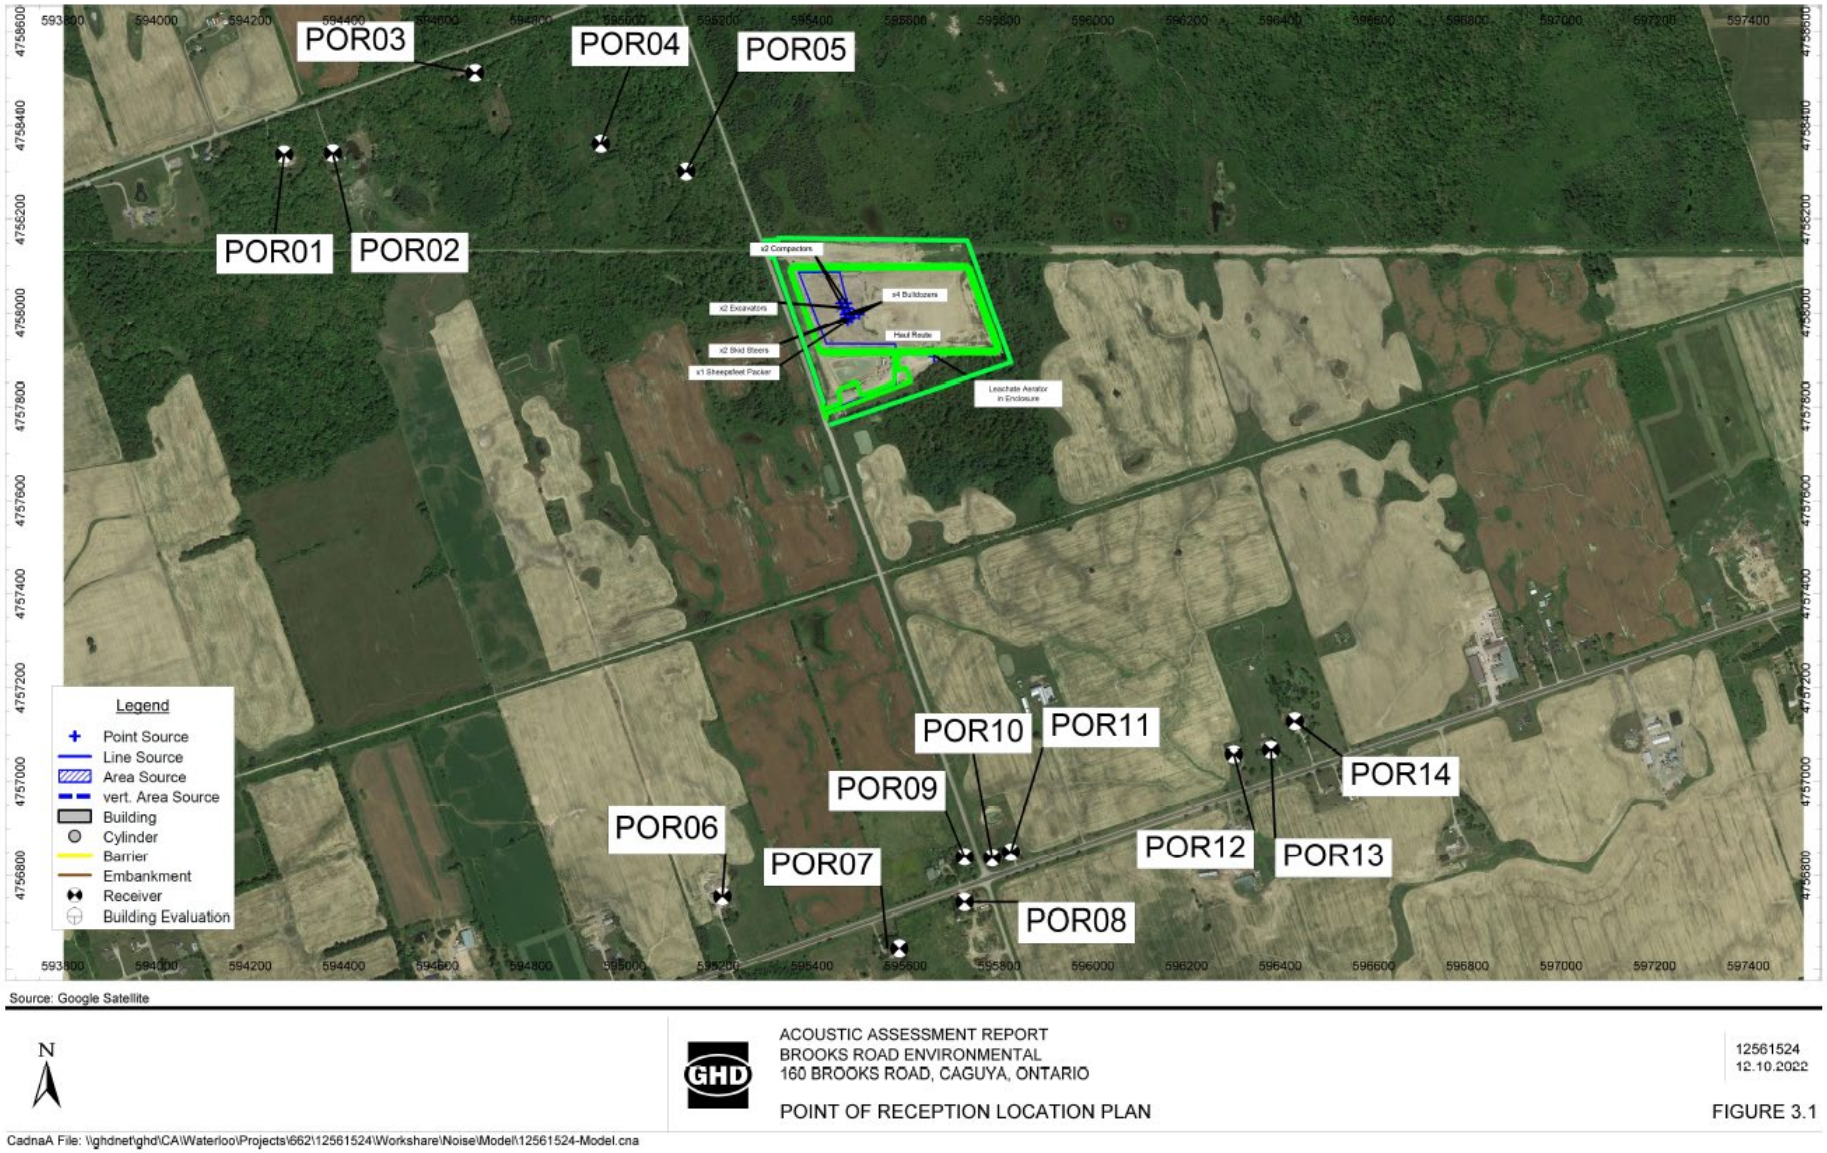

Figure 3.1 Noise Sensitive Receiver Locations

3.2 Description of Existing Conditions

3.2.1 Local Traffic Data

There are three roads located within the Study Area including:

1. Townline Road – is a two-lane dirt rural road with minimal local traffic only
2. Brooks Road – is a two-lane road with minimal local traffic and primarily used by Brooks Road Landfill
3. Highway 3 – is a two-lane road with significant 24-hour road traffic

Traffic data was obtained from the local traffic authority and the Ministry of Transportation. Townline Road and Brooks Road experience low traffic volumes based on site observations and also confirmed by the traffic authority. Highway 3 traffic volumes are elevated and subject of analysis.

MECP's Ontario Road Noise Analysis Method for Environment and Transportation (ORNAMENT) software is the approved road traffic model that is currently used in the province of Ontario to evaluate noise generated from road traffic. However, the model does not graphically generate contours and cannot be used to evaluate large areas and multiple road corridors simultaneously. ORNAMENT modeling predictions are also limited to noise predictions less than 500 m from the source and a minimum traffic volume of 40 vehicles per hour is required to evaluate an individual roadway.

Due to these model limitations, CADNA A was selected for the purposes of this Study as the preferred modeling software for analysis of road traffic generated background noise existing conditions. In addition, the CADNA A modeling software is better suited to handle multiple noise sources and can generate contour plots with imported base maps.

Annual Average Daily Traffic (AADT) values are the only reported data for less travelled roads, which presents a problem when estimating daytime and nighttime background noise levels as the values do not provide a distribution for the two time periods. GHD used recommendations for traffic breakdown for provincial highways and regional roads as outlined in the ORNAMENT guidance document to address this issue. The most current road traffic volumes were obtained from Haldimand County and the Ministry of Transportation (MTO). The following AADT values were available for road segments within the Study Area:

– Highway 3 (MTO, 2016) – 3,250 vehicles / day
– Brooks Road (Haldimand County, 2019) – 131 vehicles / day

The existing noise conditions within the Study Area were quantified using the industry standard CADNA A software and the road traffic data provided by the regulatory authorities. The US Department of Transportation Federal Highway Administration Traffic Noise Model (TNM) calculation standard was used in CADNA A to quantify the noise levels.

Vehicular road traffic generates noise that consists of mechanical noise from the engine and brakes, friction noise created from wheel contacting the road surface, and aerodynamic wind noise. Traffic volume, speed, road composition, gradient and surface type will affect the overall traffic noise that can be generated. Proximity and line-of-sight to the road corridor are most consequential for quantifying the off-Site noise exposure conditions.

The model calculates the predicted equivalent sound level (Leq) respective of the defined daytime (7 a.m. to 11 p.m.) and nighttime (11 p.m. to 7 a.m.) periods.

Figure 3.2A and Figure 3.2B present the road traffic sound level contours within the Study Area for the daytime and nighttime periods, respectively.

3.2.2 Off-Site Haul Routes

Highway 54 to Highway 3 is primarily used to reach Brooks Road and the off-Site haul route will not change regardless of the capacity modification. Any potential traffic increase to support the proposed increased landfill capacity will be evaluated using the noise model based on the future road traffic data.

3.2.3 MECP Technical Guidelines and Standards

The Noise character of the Study Area was defined in accordance with the MECP guidelines NPC-300 "Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning," October 2013.

As stated in the guideline:

A "Class 1 Area" means an area with an acoustic environment typical of a major population centre, where the background noise is dominated by the urban hum.

"Class 2 Area" means an area with an acoustic environment that has qualities representative of both Class 1 and Class 3 Areas, and in which a low ambient sound level, normally occurring only between 23:00 and 07:00 hours in Class 1 Areas, will typically be realized as early as 19:00 hours.

Other characteristics which may indicate the presence of a Class 2 Area include:

– Absence of urban hum between 19:00 and 23:00 hours
– Evening background sound level defined by natural environment and infrequent human activity
– No clearly audible sound from stationary sources other than from those under impact assessment

"Class 3 Area" means a rural area with an acoustic environment that is dominated by natural sounds having little or no road traffic, such as the following:

– A small community with less than 1,000 population
– Agricultural area
– A rural recreational area such as a cottage or a resort area
– A wilderness area

The urban sound level limits are 5 A-weighted decibels (dBA) greater in comparison to the rural limits to account for the elevated background sound level or the urban hum due to road traffic or adjacent industrial/commercial activities.

Landfill activities and on-Site operations are compared directly against a daytime one-hour Leq sound level limit of 55 dBA for landfill operations that are limited to 7 a.m. to 7 p.m. under the "Noise Guidelines for Landfill Sites" (N-1), October 1998.

3.2.4 2021 ECA and Existing Sensitive Receptors

The 2021 ECA amendment application that was prepared for the vertical expansion fill rate amendment and leachate treatment system confirmed that the Study Area immediately surrounding the Site is a mixed acoustic Class 2 and Class 3 area, depending on the proximity of the sensitive receiver to the adjacent road corridors and traffic volumes.

Acoustic Class 2 areas are defined by NPC-300 as a Noise environment with elevated daytime noise levels. Acoustic Class 3 areas are defined by NPC-300 as rural areas with an acoustic environment that is dominated by natural sounds having little or no road traffic.

The nine residential dwellings located along Highway 3 are considered to be Class 2 receivers and the five residential dwellings situated away from the corridor are considered to be Class 3 receivers. However, N-1 is the applicable regulatory Guideline for compliance assessment purposes for this Facility and the proposed capacity increase.

The nearest residential dwelling is approximately 232 m from the property boundary. It should be noted that a shredder system is no longer in use at the Landfill.

3.2.5 Landfill Existing Conditions

Brooks Road Landfill is proposing to increase the total landfill capacity by 219,400 m^3 maintaining the current daily approved fill rate. With this increase in mind, the equipment currently utilized On-Site is expected to continue. Therefore, the significant environmental noise sources at the Landfill include the following is considered a maximum volume to allow for flexibility in site operations:

– 2x Leachate Aerator in an Enclosure (24/7 steady state operation) (91.4 dBA)
– 3x Bulldozers (daytime operation only) (106.3 dBA)
– 2x Compactors (daytime operation only) (106.5 dBA)
– 1x Rock Truck (daytime operation only) (105 dBA)
– 2x Excavators (daytime operation only) (106.5 dBA)
– 2x Skid Steers (daytime operation only) (109.1 dBA)
– 1x Sheepsfoot Packer (daytime operation only) (106.5 dBA)

On-Site haul route truck activities are summarized below:

Table 3.1 On Site Vehicle Volumes

Type of Vehicle	Day 7a.m.- 7 p.m. (Trips/hour)	Evening 7p.m.- 11 p.m. (Trips /hour)	Night 11 p.m.- 7 a.m. (Trips /hour)
On-Site Haul Route (Source TR2)	16	0	0

These noise sources generate continuous steady state mechanical noise and will be the subject of analysis for the evaluation. These noise sources are input into an industry standard Noise model that includes all significant On-Site structures (buildings, equipment, storage tanks and silos).

Computer Aided Noise Abatement Modeling Software (CADNA A), version 2023, is based on the ISO 9613-2 standard "Noises – Attenuation of Sound During Propagation Outdoors – Part 2: General Method of Calculation." The CADNA model is the industry standard for environmental noise modeling in Ontario.

The worst-case cumulative Site-wide sound levels estimated at the receptor(s) included attenuation effects due to geometric divergence, atmospheric attenuation, barriers/berms, ground absorption and directivity, as applicable significant noise sources at off-Site buildings were input into the model as intervening structures.

Cadna A modelling assumptions applied include the following:

– Noise Sources | All sources were modelled using the 1/1 octave band data from manufacturer's sound level data or reference materials
– Noise Source Elevation | The heights of the noise sources were modelled at the tallest point to represent the worst-case line of sight and emission of noise
– Ground Absorption | The model included water (G=0), soft/porous ground (G=1), and gravel/hard ground (G=0.25)
– Receptor elevation | POR receptor heights were modelled appropriately to represent the worst-case elevation based on one or two-storey residences at the worst-case compass directions from the Site as no houses are present
– Time-weighted Adjustment | Time-weighted adjustments for sources that do not operate continuously were utilized
– Tonality | A +5 dBA adjustment was applied for tonal sources if applicable
– Foliage | Foliage attenuation was not considered in our analysis as a conservative assumption

Table 3.2 Noise Modelling Parameters

Item	Model Parameters	Model Setting
1	Temperature	10°C
2	Relative humidity	70%
3	Wind speed	Downwind condition; wind speed of 3 m/s
4	Max. Search Radius (m)	2500 m
5	Noise propagation model	CadnaA (DataKustik 2023)
6	Standard	ISO 9613
7	Terrain parameters	Flat topography was assumed
8	Reflection parameters	2 orders of reflection

In order to predict the future worst-case noise impacts from the Project activities, representative octave band noise data was used, measured from construction/processing equipment similar to what is noted to be required for the Project. This data was obtained from the United Kingdom's Department of Environment Food and Rural Affairs (DEFRA) Update of Noise Database for Prediction of Noise on Construction and Open Sites, 2005 and 2006 (common source used globally). The United States Department of Transportation, Federal Highway Administration (FHWA) document FHWA Roadway Construction Noise Model User's Guide, 2006 was used as a supplemental document to obtain sound level data for equipment not listed by DEFRA.

The existing Landfill noise contours are presented on **Figure 3.3**. The noise impacts predicted at the 14 residential dwellings are below the 55 dBA noise limit (blue contour plot) defined in Guideline N-1. The future off-Site environmental noise impact from the Brooks Road Landfill Facility will be modelled using this industry standard acoustical model methodology to evaluate the capacity modifications in terms of the net effects.

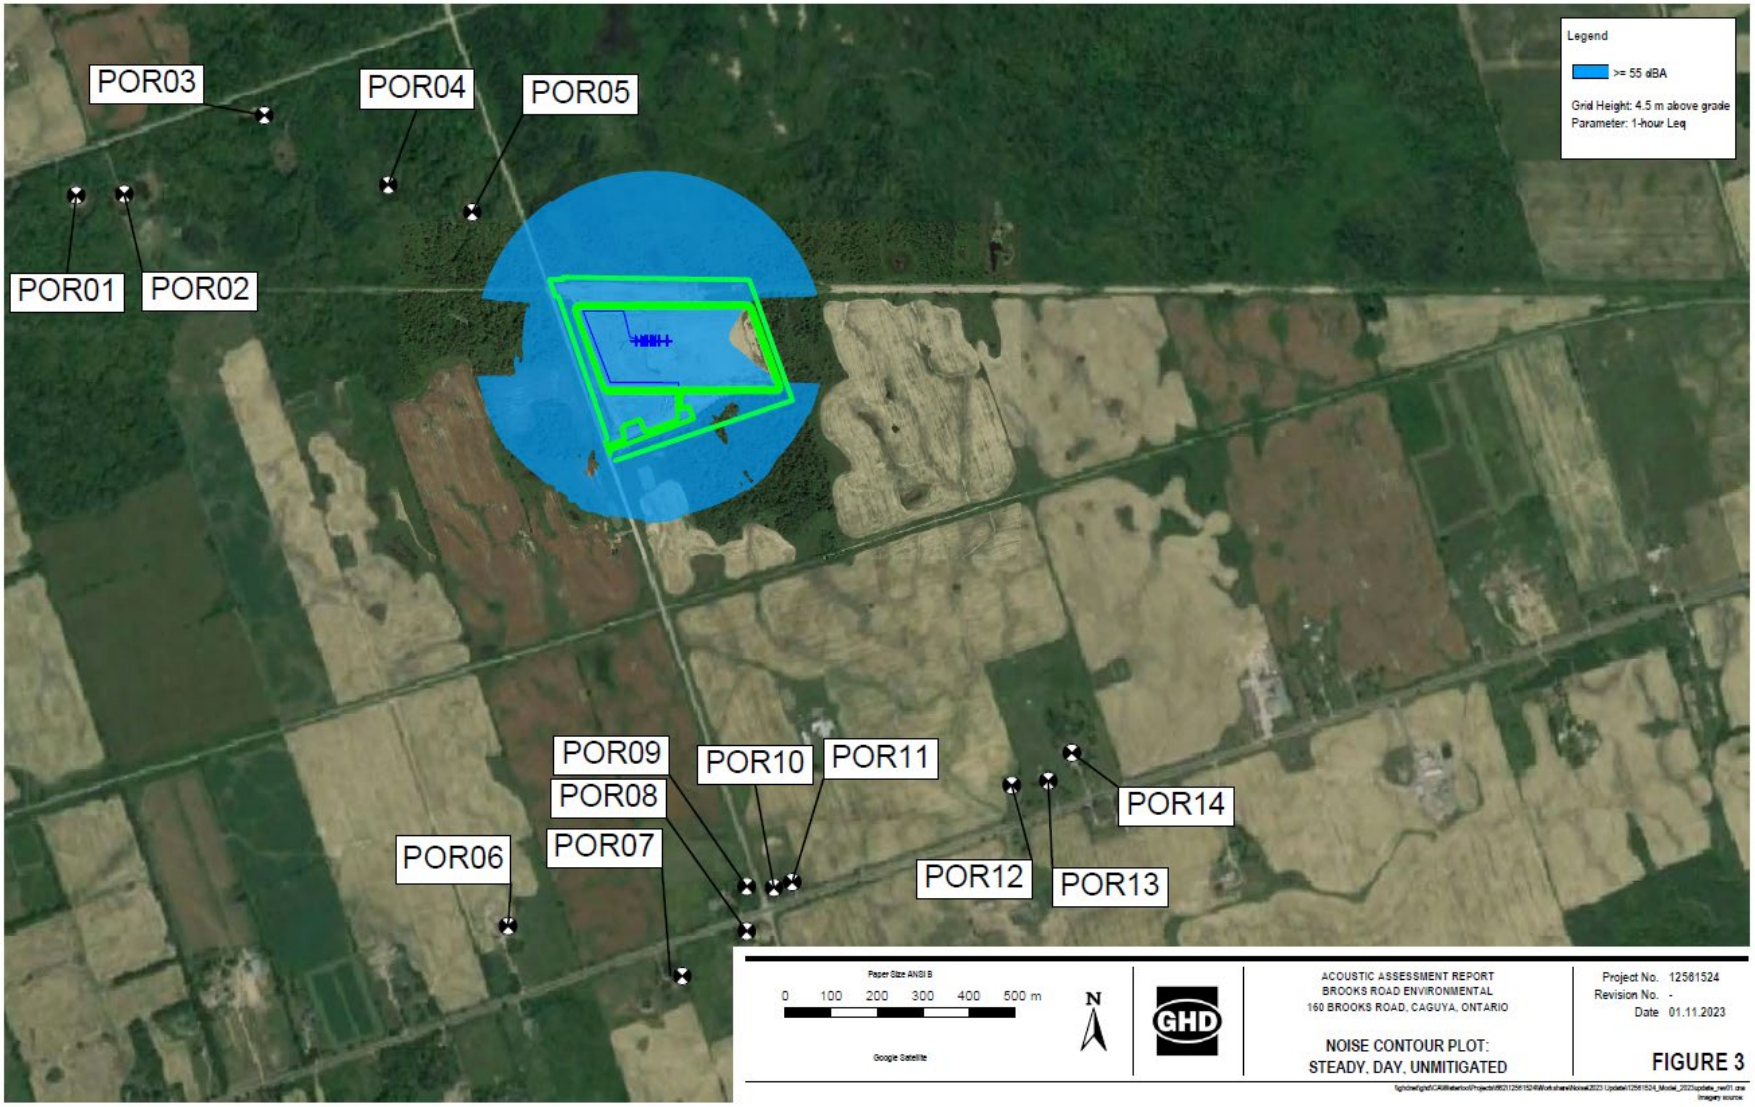

Figure 3.3 Noise Contours (Existing Landfill Conditions)

4. Potential Effects, Mitigation Measures & Net Effects

A Project Description, which includes proposed engineering design figures, was prepared so that potential environmental effects and mitigation measures could be identified. The following subsections provide a general summary of the proposed undertaking.

4.1 Description of Project Components and Activities

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in Table 4.1.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	220.75224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted north by 30 m. East and west ditches will extend north to maintain full perimeter ditch.

Design Component	Existing Landfill	Proposed Capacity Expansion
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Methodology and Investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2.0** of this report.

4.2.1 Steady State Sound Level Impact Assessment

The worst-case assessment of steady-state noise sources at the selected points-of-reception was based on measured sound pressure levels. Cadna A Noise Modelling Software (CadnaA), version 2023, was used to model the potential impacts of the significant noise sources. Cadna A calculates sound level emissions based on the ISO 9613-2 standard "Noises – Attenuation of Sound during Propagation Outdoors".

The worst-case cumulative Facility-wide attenuated sound levels estimated at the receptor(s) included attenuation affects due to geometric divergence, atmospheric attenuation, barriers/berms, ground absorption and directivity, as applicable for all significant noise sources. Off-site buildings were input as intervening structures.

4.2.2 Future Landfill Operation Sound Levels

In order to consider future compliance of noise levels from the Site, an evaluation was carried out on the on the predicted sound levels that will be associated with the proposed capacity increase. The criteria for landfilling-related sound levels are established in the MECP guidelines for Site[1], and are as follows:

– 55 dBA for daytime operations (7 am to 7 pm)
– 45 dbA for nighttime operations (7 pm to 7 am)

The assessment considered the potential changes in existing truck traffic routes on-Site and on the haul route to support the proposed capacity increase.

These noise sources are input into an industry standard Noise model that includes all significant on-Site structures (buildings, equipment, storage tanks and silos). Computer Aided Noise Abatement Modeling Software (CADNA A), version 2023, is based on the ISO 9613-2 standard “Noises – Attenuation of Sound During Propagation Outdoors – Part 2: General Method of Calculation.” The CADNA model is the industry standard for environmental noise modeling in Ontario.

The worst-case cumulative site-wide sound levels estimated at the receptor(s) included attenuation effects due to geometric divergence, atmospheric attenuation, barriers/berms, ground absorption and directivity, as applicable significant noise sources at off-site buildings were input into the model as intervening structures.

[1] MECP’s NPC-300 “Environmental Noise Guideline, Stationary and Transportation Sources – Approval and Planning,” October 2013.

In order to predict the future worst-case noise impacts from the Project activities, representative octave band noise data was used, measured from construction/processing equipment similar to what is noted to be required for the Project. This data was obtained from the United Kingdom's Department of Environment Food and Rural Affairs (DEFRA) Update of Noise Database for Prediction of Noise on Construction and Open Sites, 2005 and 2006 (common source used globally). The United States Department of Transportation, Federal Highway Administration (FHWA) document FHWA Roadway Construction Noise Model User's Guide, 2006 was used as a supplemental document to obtain sound level data for equipment not listed by DEFRA.

Final (near closure) landfill topography was selected to evaluate the worst-case noise impact exposure for off-site residences based on the final vertical expansion. The final landfill topography elevates the source height and documents the worst-case position of the noise sources relative to the off-site receivers based on line-of-sight. Representative noise specifications were used for all mobile equipment such as trucks and bulldozers and applied to the On-Site travel routes based on the cell development design concept.

Landfill activities and supporting equipment are compared directly against a daytime one-hour Leq sound level limit of 55 dBA for landfill operations for all PORs.

4.3 Noise Net Effects

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those Noise criteria which might be affected by the project as identified in Section 2. The effects assessment describes how existing environmental conditions in the Study Area(s) would change as a result of the construction and operation of the proposed undertaking.

As described in Section 2, a "Yes" was applied to the following Noise criteria:

Table 4.2 Air and Noise Net Effects

	Criterion	YES	NO	Additional Information
	Might the project…			
3. Air and Noise				
3.4	Cause negative effects from the emission of noise?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in noise emissions associated with continued operation of the Site.

With respect to the above criteria/criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.3.1 Potential Effects on Noise Environment

The proposed capacity increase will result in noise emissions associated with truck movements to/from the Site and on-Site landfill equipment requirements. Fourteen off-Site residential dwellings will be potentially impacted from the existing Landfill activities. The predicted noise impact range is 42 to 53 dBA (rounded). POR5 is the most impacted at 53 dBA. All residential dwellings are below the 55 dBA noise limit.

From a potential noise impact exposure perspective, the future conditions for additional capacity are near identical and the only difference is the potential for truck traffic on the haul route up to 16 trucks per hour during daytime operations only and the elevated height of the tracked vehicles at the worst-case elevation when approaching cell closure.

Noise contours for the proposed Future Conditions are presented on Figure 4.1.

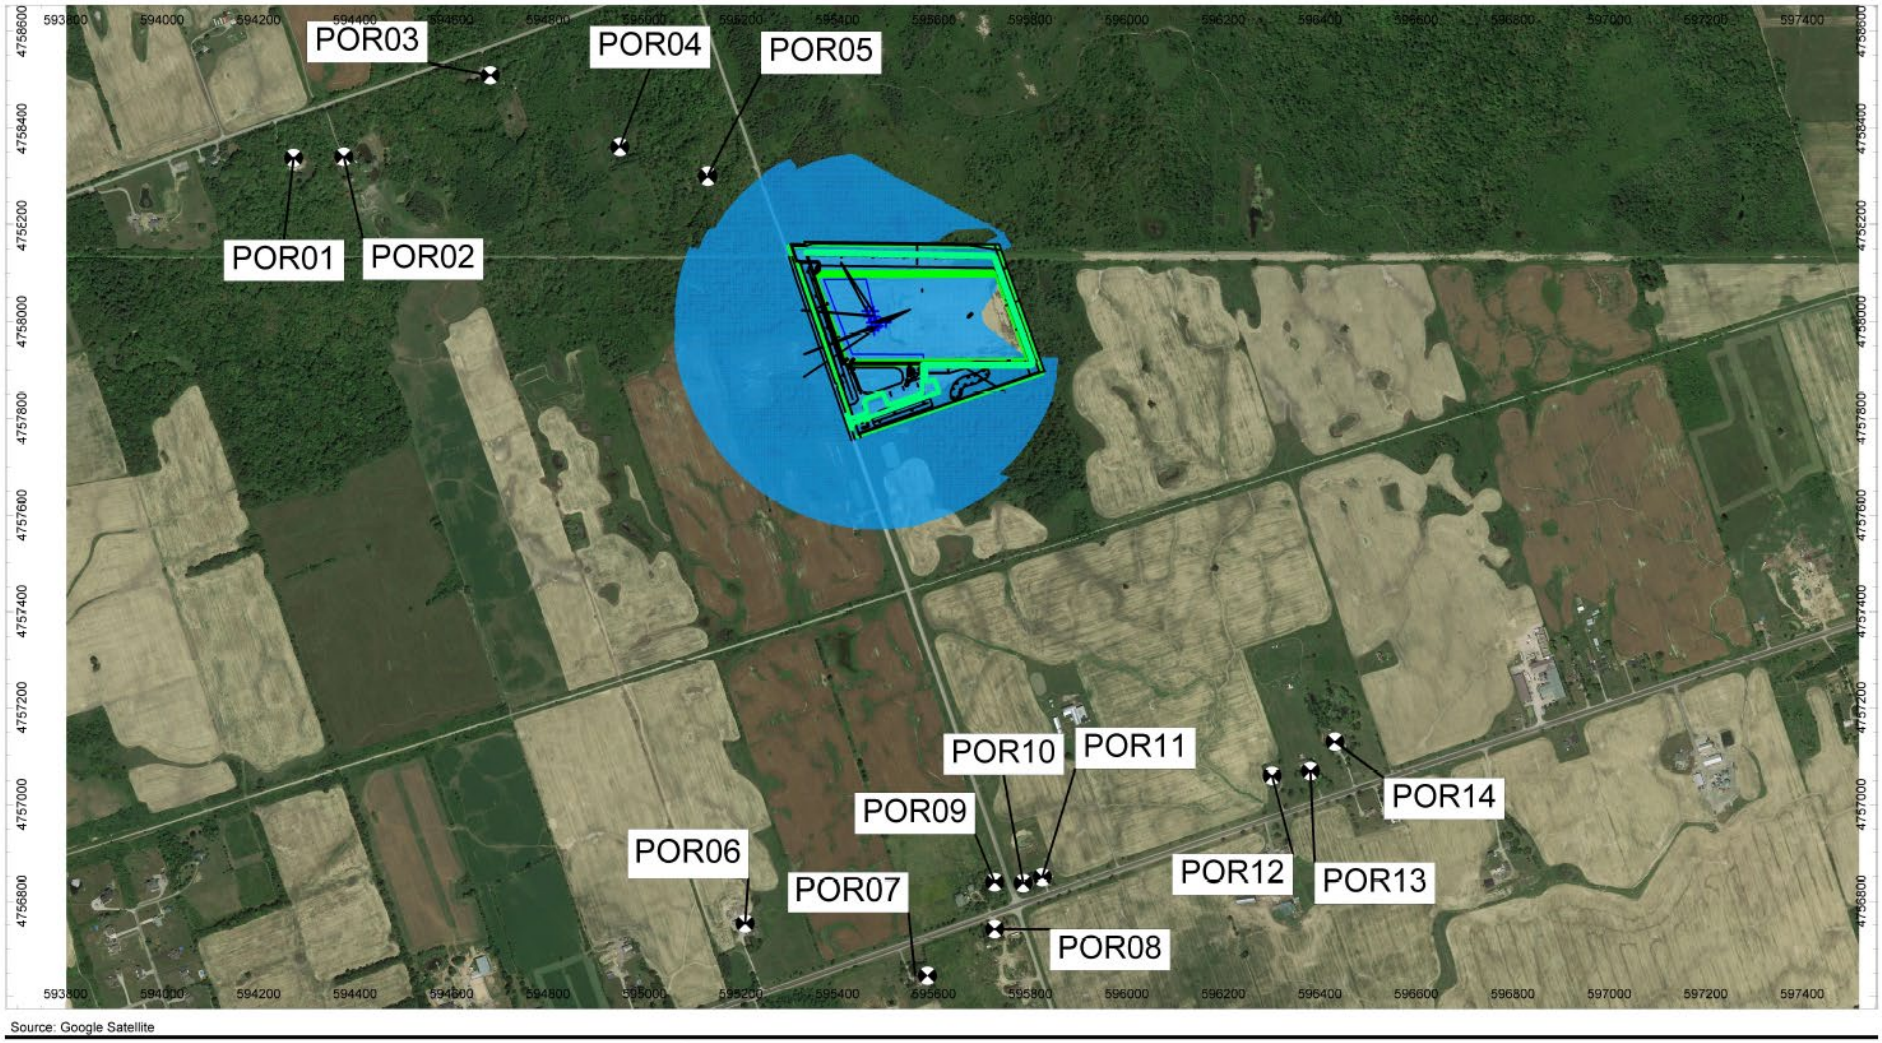

Figure 4.1 Noise Contours (Future Landfill Conditions)

4.3.2 Mitigation Measures

Based on the description of the proposed capacity increase provided in **Section 1** and the characterization of Noise Existing Conditions within the Study Areas described in **Section 3**, there are no mitigation measures recommended to be incorporated into the future conditions designs in order to avoid or minimize impacts from Noise. Mitigation measures are not required because the predicted off-Site noise impact meets the applicable 55 dBA regulatory noise limit.

As all residential dwellings are below the 55 dBA noise limit, no specific mitigation measures are required. The implementation of Best Management Practices (BMPs), as recommended in the Vertical Capacity Expansion EA such as barriers and/or berms at Landfill perimeter and administrative controls that limit On-Site landfilling activities will serve to minimize noise impacts from the Site.

The site also has a Noise Best Management Practice Plan (BMPP) that Facility staff adhere to which was developed in January 2021. The BMPP details the following recommended activities to minimize noise emissions on site:

4.3.3 Equipment Inspection and Maintenance Procedures

As a minimum, the following activities or events shall be inspected and recorded in the inspection logs:

– Monthly inspection of haul routes and roadways will be carried out and maintenance will be performed within 1 month or as soon as conditions would allow.
– Unpaved roads and regularly travelled portions of the site will be re-graded as required.
– All on-site BRE and contractor heavy mobile equipment is to be inspected before first use and annually afterwards to comply with NPC-115 equipment guidelines.
– All heavy mobile equipment shall be kept in good working order and fitted with working mufflers if required. Effective Noise control depends on machinery being in good condition and fitted with working mufflers.

4.3.4 Best Practices and Control Measures for Landfilling Activities

Landfill operators, machine operators and contractors are recommended to review and follow the practices and controls as outlined below:

– All heavy mobile equipment activities will be limited to daytime hours (07:00 to 19:00 hours).
– All heavy mobile equipment shall be kept in good working order as deterioration may increase equipment sound levels.
– Vehicle movements are recommended to stay within movements areas and reduce the use of back-up alarms, where practical. This should coincide with safety considerations.
– If alternate hauling route is proposed by BRE, a qualified individual should be consulted and approve the change.
– Administrative controls are required to eliminate uncontrolled tailgate banging and the use of experienced equipment operators.
– Where equipment back-up alarms will be used near areas that are potentially environmentally sensitive, alternative alarms should be used to reduce sound levels and annoyance. Ambient adjustable, strobe light or broadband alarms are options to consider.
– Landfilling activities should be limited to daytime hours (07:00 to 19:00 hours).

It is noted that due to improvements in operations and change in waste acceptance type has limited the Landfill's issues with pests over the last 2 years and have never used a audible pest control system. Should pest control devices or similar activities be utilized in the future these systems will be assessed for noise to ensure no negative off-site noise impacts prior to operation.

4.3.5 Recordkeeping

Records shall be kept of when and how Noise control measures are implemented and when complaints, if any, are received. Example of a complaint form is provided in Appendix B. The form will be updated every 5 years or upon employee turnover. As a minimum, the following activities will take place if a complaint is received:

- Complaints or concerns expressed directly to contractors or site personnel should be communicated immediately to the Site Manager so the formal complaint process can be initiated and followed up.
- The complaint form will provide the description of the complaint, environmental conditions, operations at time of incident, and description of all responses and follow up actions.
- Reporting will be conducted with the intent to manage any potential Noise issues through operational changes to construction and landfilling.
- If the complaint is valid or persistent (i.e., not an upset condition), investigation through sound level measurements will be conducted and reported.
- On an annual basis, the complaint records will be reviewed, and any unfavourable trends will be examined further to identify corrective actions and included in the annual report.

4.3.6 Net Effects

Similar to the Vertical Capacity Expansion EA and Fill Rate Amendment), the 14 residences that were anticipated to experience a change in the predicted off-Site noise impact due to the previously approved landfill expansion, may continue to hear landfill activities; however, even with the increased capacity, no change from the noise analysis completed as part of the Vertical Capacity Expansion EA and Fill Rate Amendment will occur. With existing mitigation measures and best practices, all residential dwellings are below the 55 dBA noise limit.

5. Monitoring Requirements and Additional Approvals

To ensure that the mitigation measures identified in **Section 4.0** are implemented as envisioned, a strategy and schedule was developed for monitoring environmental effects. With these mitigation measures and monitoring requirements in mind, commitments have also been proposed for ensuring that they are carried out as part of the construction, operation, and maintenance of the proposed undertaking.

5.1 Monitoring Requirements

No monitoring requirements are needed for on-going noise compliance.

5.2 Additional Approvals

No additional approvals are required outside of the proposed ECA amendment for the daily capacity increase.

6. Conclusion

The BRE Facility is located in a mixed acoustical Class 2 and Class 3 area based on the MECP NPC 300 guideline and depending on the proximity of the off-Site residential dwellings to Highway 3. Nine residential dwellings located along Highway 3 are considered to be Class 2 receivers and the five residential dwellings situated away from the

corridor are considered to be Class 3 receivers. Guideline N-1 is the applicable regulatory criteria for compliance assessment purposes for the Facility and the proposed capacity increase requires that the BRE Facility achieve a noise limit of 55 dBA at all off-Site residential dwellings of concern. The Landfill is limited to daytime only operations from 7 a.m. to 7 p.m. The Existing Conditions at the BRE Facility are below the 55 dBA noise limit.

The capacity increase considers one future conditions evaluation which will remain well below the Guideline N-1 noise limit of 55 dBA at all existing sensitive points of reception.

Table index

Appendices

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown in **Figure 1.1**.

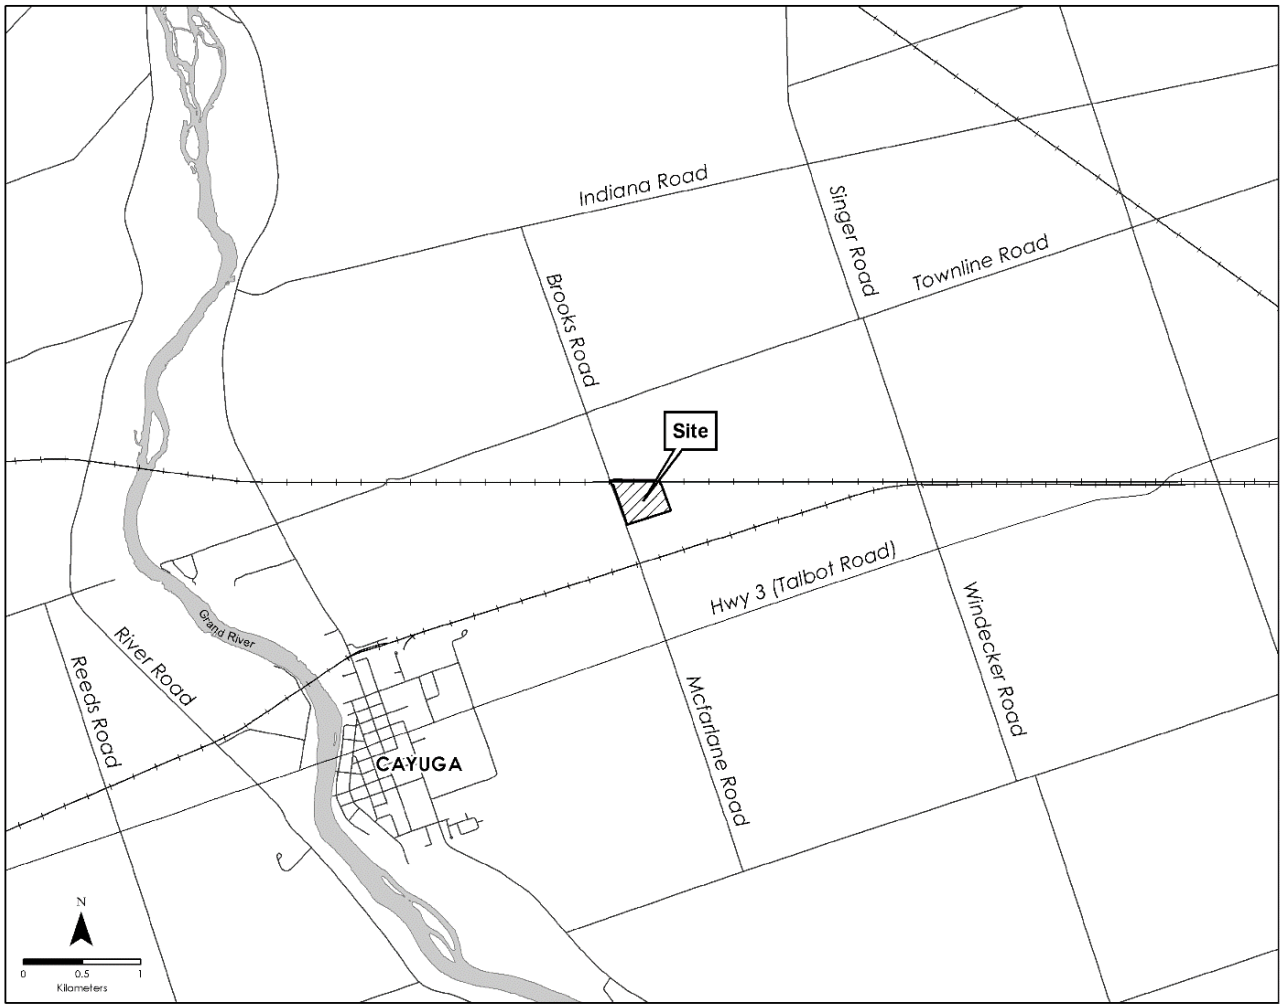

Figure 1.1 Location of the Proposed Undertaking

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302, has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by

the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customer for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by approximately 219,400 m^3, adding capacity equal to approximately two additional years. This expansion would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown in **Figure 1.2**.

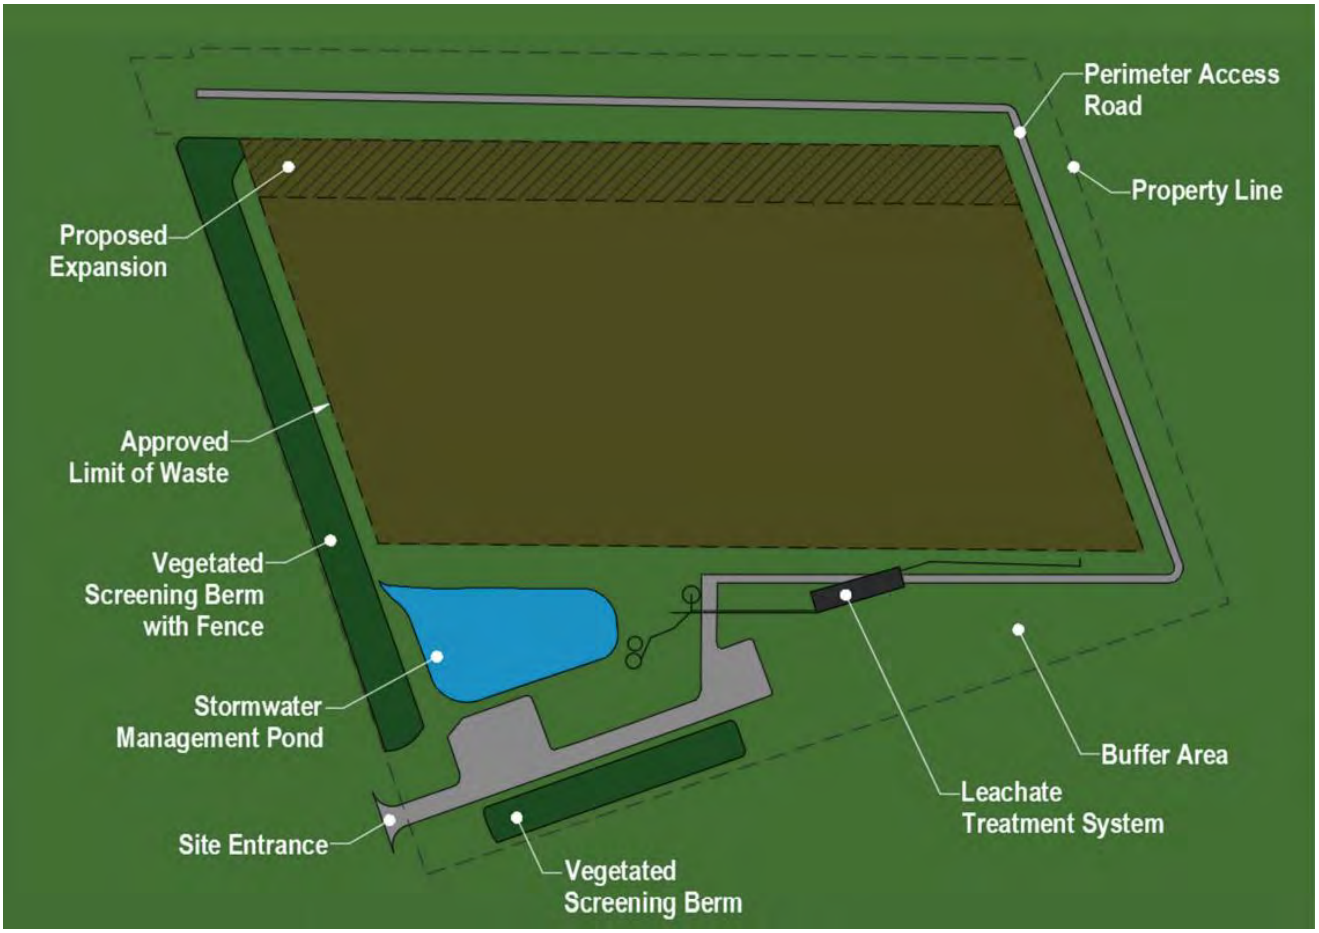

Figure 1.2 Proposed Capacity Expansion Concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by approximately 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:

1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302.

GHD has prepared a Natural Environment assessment on behalf of BRE for the proposed undertaking. This report documents the following as it relates to the Natural Environment:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project)
– Potential effects on the environment, mitigation measures, and net effects
– Future monitoring requirements to be implemented

The Study Areas reviewed for the Natural Environment assessment were as follows (see **Figure 2**):

– Site Study Area (SSA) – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended
– Local Study Area (LSA) – all lands and waters within a 1-kilometre (km) radius of the SSA boundaries

The lands surveyed within the LSA, surrounding the SSA, are referred to throughout this report as three areas: North Lands, East Lands, and West Lands.

2. Screening Criteria Checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act*

As noted in the Guide:

"*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the*

proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required. Where a "yes' has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion."

Each criterion is based on a question which is prefaced with the phrase, "*Might the Project*…". **Table 2.1** was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Natural Environment discipline. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in **Section 4** of this report.

Table 2.1 Screening Criteria Checklist

	Criterion Might the project…	YES	NO	Additional Information
4.0 Natural Environment				
4.1	Cause negative effects on endangered, threatened or special concern species of flora or fauna or their habitat?	X		The provincial Species at Risk Ontario (SARO) and federal *Species at Risk Act* (SARA) list numerous endangered, threatened, and special concern species of flora or fauna within the SSA and LSA. Some of these species (e.g., barn swallow [*Hirundo rustica*]) have been observed within the SSA.
4.2	Cause negative effects on protected natural areas such as Areas of Natural and Scientific Interest (ANSIs), Environmentally Sensitive Areas, or other significant natural areas?		X	As there are no ANSIs, Environmentally Sensitive Areas, or other significant natural areas within the SSA the proposed expansion is not expected to cause a negative effect.
4.3	Cause negative effects on designated wetlands?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on designated wetlands. Provincially Significant Wetlands (PSWs) are present within the southern boundary of the SSA and throughout the LSA.
4.4	Cause negative effects on wildlife habitat, populations, corridors, or movement?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on wildlife habitats, populations, corridors, or movements. It should be noted MNRF have identified Wildlife Activity Area (white-tailed deer wintering area) as being present within the SSA and LSA.
4.5	Cause negative effects on fish or their habitat, spawning, movement, or environmental conditions (e.g., water temperature, turbidity, etc.)?		X	The proposed landfill expansion would not result in negative effects on fish or their habitat, spawning, movement, or environmental conditions (e.g., water temperature, turbidity, etc.) due to lack of presence within the SSA.
4.6	Cause negative effects on locally important or valued ecosystems or vegetation?		X	The proposed landfill expansion would not result in negative effects on locally important or valued ecosystems or vegetation.
4.7	Increase bird hazards within the area that could impact surrounding land uses (e.g., airports)?		X	The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations. This is unlikely to cause an increase in bird hazards.

3. Existing Conditions

The following subsections describe the existing conditions that are found within the SSA and the LSA of the proposed project.

3.1 Methodology

3.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Natural Environment Study Team to determine existing Natural Environment conditions within the Study Areas. The sources reviewed are outlined in **Table 3.1**.

Table 3.1 Secondary Source Information Reviewed

Source	Information Reviewed
Ministry of Northern Development, Mines, Natural Resources and Forestry (MNRF)	– Species at Risk (SAR) – Natural Heritage Features data layers from Land Information Ontario – Aquatic Resource Area (ARA) Survey Points
Ministry of Environment, Parks and Conservation (MECP)	– SAR in Ontario
Fisheries and Oceans Canada (DFO)	– 2022 SAR fish, mussel, and critical habitat maps for the Study Areas
Grand River Conservation Authority (GRCA)	– Fisheries Management Plan (2001) – Wetlands map layer
Niagara Peninsula Conservation Authority (NPCA)	– Wetlands map layer
GHD Limited (GHD)	– Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment (February 2017)
Conestoga Rovers and Associates (CRA)	– Scoped Environmental Impact Study Former Railway Corridor Lands North of Brooks Road Landfill, Haldimand County, ON (December 2013)
Ontario Breeding Bird Atlas (OBBA)	– Breeding bird data for the Study Areas
Ontario Butterfly Atlas (OBA)	– Species records for the Study Areas
Ontario Reptile and Amphibian Atlas (ORAA)	– Species records for the Study Areas

3.1.2 Consultation

The Guelph District Ministry of Northern Development, Mines, Natural Resources and Forestry[1] (MNRF), the Ministry of Environment, Conservation and Parks (MECP), the Grand River Conservation Authority (GRCA), and the Niagara Peninsula Conservation Authority (NPCA) were consulted on March 2, 2022, to request available natural heritage information, aquatic records, relevant wildlife records and Species at Risk (SAR) records. A response was received from MNRF and NPCA on March 4, 2022, from GRCA on March 8, 2022, and from MECP on September 13, 2022.

[1] The Ministry of Natural Resources and Forestry (MNRF) amalgamated with the Ministry of Northern Development and Mines in June 2021 to form the provincial Ministry of Northern Development, Mines, Natural Resources and Forestry (herein referred to interchangeably as MNRF).

Additional information provided by the agencies was incorporated into this report. Agency correspondence is included in **Appendix A**.

Although there was no direct consultation with the agencies during the preparation of this *Natural Environment Assessment Report*, the MNRF, GRCA, and NPCA were consulted extensively during the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017). GRCA and NPCA also participated in a site walk with GHD ecologists to confirm wetland boundaries in the North Lands on July 5, 2013. GRCA conducted an additional site walk with GHD ecologists on June 12, 2014, to confirm the wetland boundaries of the East Lands.

A meeting was held with the Mississauga's of the Credit First Nation (MCFN) on July 19, 2022, and provided an opportunity for GHD to answer questions the MCFN had regarding the proposed capacity expansion of the Brooks Road Landfill.

3.1.3 Species at Risk Screening

Prior to conducting the field surveys, a screening of SAR with potential to be present within the Study Areas was completed. The term SAR is used to encompass species that are listed as Endangered (END), Threatened (THR), or Special Concern (SC) under the provincial *Endangered Species Act* (ESA; 2007) or under the federal *Species at Risk Act* (SARA; 2002). Only species listed as THR and END receive protection under the ESA. SC species may be protected under other policy instruments such as those for Significant Wildlife Habitat (OMNR 2000). With the exception of migratory birds protected by the *Migratory Bird Convention Act* (MBCA; 1994) and aquatic species, SARA generally does not apply on non-federal lands.

3.1.4 Field Investigations

GHD staff conducted various field investigations within the North and East Lands throughout 2020 to 2022 to identify natural environment habitats, and species and features present within the Study Areas (**Table 3.2**). Field surveys were conducted within the LSA that were directly adjacent to the SSA (up to 150 m radius or limited to the right-of-way of Brooks Road) to accurately characterize the neighbouring habitat and natural features present. No wildlife species surveys were conducted within the SSA due to active operation of the landfill and limited suitable habitat; however, incidental observations were collected at all field visits and are discussed in **Section 3.2.7**.

Table 3.2 Field Investigations

Field Investigation	Dates
Ecological Land Classification and Vegetation Inventory	July 10, 2022 (East Lands) June 28, 2021 (North Lands)* June 29, 2020 (North Lands)*
Amphibian Surveys	April 12, May 11, and June 15, 2022 (North, East, and West Lands) March 25, April 13, and June 28, 2021 (North Lands)* May 28, 2020; June 29, 2020 (North Lands)*
Breeding Bird Surveys	June 10, June 27, and July 10, 2022 (East Lands)
Songmeter recording	June 13 to July 10, 2022 (North Lands)
Incidental Species Observations	Collected during all field visits
Notes	
* Completed as part of ECA monitoring of the North Lands which are provided here for a more fulsome characterization of the Study Areas (GHD 2021, 2022).	

Data collection focused on assessing vegetation and wildlife habitat characteristics within the Study Areas. Methodology for each field survey is provided below.

3.1.5 Aquatic Community Surveys

The MNRF were consulted for aquatic community information. Aquatic community surveys were not completed during this round of Study Area investigations due to:

- The footprint of the SSA, from the natural environment perspective, is coincident with the existing property boundary
- Semi-aquatic species such as Blanding's turtle will be considered to have assumed presence (based on local records)
- Water discharged from Site is governed by an ECA that is not anticipated to change because of these activities
- Additional Site controls and mitigation measures at this property boundary which limit natural environment interactions with the Site and surrounding areas are employed following the recommendations of the recent Vertical Expansion EA

Previous aquatic community surveys include a rapid habitat assessment conducted along the roadside on October 28, 2016, where property access was permitted. This investigation aimed to determine the presence and type of fish habitat within the LSA. Parameters collected included stream channel dimensions, flow characteristics including evidence of groundwater discharge, substrates, instream/in-water cover opportunities, riparian and instream vegetation, and the presence of physical barriers to fish movement and disturbances (past and present). Findings of this aquatic habitat assessment are presented in the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017).

3.1.6 Ecological Land Classification and Botanical Inventory

Vegetation communities within the East Lands were mapped and described following the *First Approximation – ELC System for Southern Ontario* (Lee et al. 1998) and the *Southern Ontario ELC Scheme* (Draft; Lee et al. 2008). A botanical inventory (including a search for rare plant species) was completed for each ELC unit where access permitted within the LSA. The vegetation inventory was compiled and refined by incidental observations recorded throughout all field visits.

3.1.6.1 Wetland Boundaries

Wetland boundaries were delineated by GHD, GRCA, and NPCA in the North Lands on July 5, 2013. GHD and GRCA delineated the wetland boundaries in the East Lands on June 12, 2014. Wetland delineations of the Study Areas were prepared following Ontario Wetland Evaluation System (OWES) methods (MNR 1994; MNR 2013). 2022 ELC mapping confirmed those wetland boundaries delineated in 2013 and 2014.

3.1.7 Calling Amphibian Surveys

Calling amphibian surveys were conducted according to the Marsh Monitoring Protocol (BSC 2009) and were carried out at six stations within wetlands in the North, East, and West Lands. Surveys commenced a half hour after sunset and consisted of listening at each station for three minutes after two minutes of silence. During the survey, any frogs or toads heard calling were documented and a measure of 1, 2, or 3 for the abundance of each species within 50 metres (m) of the survey point, 50 – 100 m of the survey point, or greater than 100 m of the survey point was applied.

3.1.8 Breeding Bird Surveys

Breeding bird surveys were conducted on June 10, June 27, and July 10, 2022, within the East Lands. This was conducted during the breeding season when most birds are on their territories engaged in breeding activities. Surveys were conducted between 5:00 and 11:00 a.m. A point count methodology was utilized, where a point count location was surveyed for five minutes, and all species seen and heard were recorded. Breeding evidence was recorded to determine if the species was a possible, probable, or confirmed breeder following protocols of the Ontario Breeding Bird Atlas (Cadman et al. 2007). Locations of the Breeding Bird Survey (BBS) stations were identified in the *Terrestrial*

and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment (GHD 2017).

A songmeter (SM1) was also installed in the North Lands to collect audio recordings of breeding bird occurrences outside of the survey periods. The songmeter collected recordings for five minutes of every hour for three hours after sunrise and three hours after sunset during from June 13, 2022, until July 11, 2022. This captured breeding bird presence during the time of the day when vocal calling was highest for songbird species. Audio recordings were analyzed by avian ecologists to determine species presence.

3.1.9 Incidental Wildlife Observations

Observations and signs of wildlife were recorded, including browse, tracks, trails, scat, burrows, remains, nests, and vocalizations.

3.2 Description of Existing Conditions

The LSA was dominated by agricultural lands under active row crops, forests, and wetlands. A photographic log is presented in **Appendix B**.

3.2.1 Designated Areas

The LSA contains natural landscape features of provincial significance (**Figure 3**).

The North Cayuga Slough Forest is an Area of Natural and Scientific Interest (ANSI), located in the northwest portion of the LSA and the Brooks Road/Townline Road intersection. This 1,214 ha landscape feature is composed of a diverse complex of woodlands, vernal pools and sloughs which are bordered by swamps (GRCA 1997). The sloughs are a result of the Beverly and Toledo silty clay plains and the Lincoln clay plains. Generally, the area is dominated by imperfectly to poorly drained lacustrine silty clay and heavy clay. The upland areas are dominated by sugar maple (*Acer saccharum*), white ash (*Fraxinus americana*) and red oak (*Quercus rubra*). Red maple (*A. rubrum*), swamp white oak (*Q. bicolour*) and black ash (*F. nigra*) typically dominate the low, wet basins. Field communities are characterized by hawthorns (*Crataegus spp.*), southern arrowwood (*Viburnum dentatum*) and narrow-leaved meadowsweet (*Spirea alba*), representing some of the many transitional environments between the distinct upland and low land areas. This area is of special importance due to its textbook clay-plain sediments and sand ridges which lead to the very distinct vegetation patterns. Previous studies have documented that 14 vegetation species and four bird species that are rare nationally, provincially and/or regionally occur in the area. This area is also home to a heronry (GRCA 1997). Of the 14 rare vegetation species, only two were observed in the LSA. These species are discussed further in **Section 3.2.8**.

The North Cayuga Swamp Wetland Complex is a provincially significant wetland (PSW) complex that is also present within the SSA and throughout the LSA in general (**Figure 4**). This wetland complex is made up of numerous individual wetlands dominated by swamp with some marsh wetlands. The PSW extends to the northernmost portion of the SSA and incorporates the wetland elements of the North Cayuga Slough Forest. The complex vegetation community is characterized by thicket swamps of narrow-leaved meadowsweet, buttonbush (*Cephalanthus occidentalis*), winterberry (*Ilex vericillata*), or speckled alder (*Alnus incana ssp. rugosa*) with red maple, gray dogwood (*Cornus foemina ssp. racemosa)*, highbush blueberry (*Vaccinium corymbosum*), and willows (*Salix spp.*) as associates (NPCA 2010). The soil is a clay, loam, or silt composition.

Majority of the LSA is white-tailed deer (*Odocoileus virginianus*) wintering area as delineated by the MNRF (**Figure 3**). Online mapping shows the majority of the SSA is also included in this delineation; however, given the SSA's fencing and lack of suitable habitat it is unlikely to be used by white-tailed deer for wintering.

3.2.2 Aquatic Communities

Consultation with the MNRF identified Pike Creek as present within the LSA; approximately 500 m west of the SSA. Pike Creek has a warm thermal regime with the following species identified: black crappie (*Pomoxis nigromaculatus*),

bluegill (*Lepomis macrochirus*), bluntnose minnow (*Pimephales notatus)*, brook stickleback (*Culaea inconstans*), brown bullhead (*Ameiurus nebulosus)*, central mudminnow (*Umbra limi)*, common shiner (Luxilus cornutus), creek chub (*Semotilus atromaculatus*), gizzard shad (*Dorosoma cepedianum*), golden shiner (*Notemigonus crysoleucas),* green sunfish (*Lepomis cyanellus)*, largemouth bass (*Micropterus salmoides*)**,** logperch (*Percina caprodes*), northern pike (*Esox Lucius*), pumpkinseed (*Lepomis gibbosus)*, rock bass (*Ambloplites rupestris*), sunfishes (*Centrarchidae spp.),* and white sucker (*Catostomus commersonii*). Pike Creek does not drain from or into the SSA, therefore was not subject to field investigations.

3.2.3 Vegetation Communities and Flora

3.2.3.1 Vegetation Communities

In June 2022, GHD conducted a vegetation inventory and Ecological Land Classification (ELC) of select areas within the LSA which included the East and North Lands. This inventory and classification builds upon field visits completed between 2013 and 2015 for the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017).

During the 2013 – 2015 EA surveys, a species of interest detected during field activities was pumpkin ash (*Fraxinus profunda*), which is ranked as S2 provincially and is a regionally rare species in the Haldimand-Norfolk County. It is found in swampy areas with standing water for most of the year. A single specimen in poor condition was found along the south base of the abandoned rail line to the east of the landfill property (within the LSA). During 2022 this species was not observed and was likely located outside the selected field areas surveyed.

Another species of interest that was detected in past field investigations conducted by others was black gum (*Nyssa sylvestre*). A small stand of black gum was found in the SSA by Natural Resource Solutions Inc. (NRSI) in 2004 at the southeast corner of the landfill prior to clearing activities. The stand of black gum was identified by GHD on the landfill property during 2016 field investigations (GHD 2017). The trees were found to be tagged and located in the direct vicinity of active landfilling activities, without any tree protection measures. Black gum is a provincially rare species (S3) in Ontario, but within Haldimand-Norfolk County black gum is considered common. Presence of these trees was not confirmed in 2022 surveys; however, wildlife exclusion fence installed around the on-Site wetlands in the southeast corner of the landfill restricts work in this area.

ELC mapping was prepared following Ecological Land Classification for Southern Ontario: A First Approximation (Lee et al. 1998) and is presented on **Figure 5**. To complete the classification, ELC-certified ecologists conducted field visits to assess the landform and parent material, soil, and vegetation present. Through assessment of these characteristics, classification of the ecological communities was completed for the North, East, and West Lands in 2016 by GHD. The balance of the LSA (up to a 1 km radius from the SSA) was assessed using aerial photography interpretation and knowledge of the area. Confirmation and update to any vegetation communities to the North and East Lands were completed during the summer of 2022. Thirty-nine ecological land classification community classes are represented within the LSA and include aquatic, swamp, marsh, meadow, thicket, forest, transportation and utilities, and cultural systems. The vegetation inventory is presented in **Appendix C**.

3.2.3.1.1 ELC from 2022 Survey

Characteristics of each of the identified community types observed during the summer of 2022 are provided below. These communities are delineated in **Figure 5** as “Field Verified – 2022”.

Upland Communities

AG: Agriculture

Agricultural fields are present throughout the LSA and are actively farmed. At the time of survey, winter wheat (*Triticum aestivum*), corn (*Zea mays ssp. mays*), and soybean (*Glycine max*) crops were planted within the AG fields of the East and West Lands. Small wetland and drainage areas were present throughout the actively farmed agriculture fields.

CVI_1: Transportation

This area is composed of roadways, a decommissioned rail line from which rail ties have been removed, and an active rail line.

CVI_2: Disposal and Recycle

This is the Brooks Road Landfill Site, which is in active operation.

CVR_4: Rural Property

This is a rural property with residential and accessory structures.

CUL: Cultural

This classification is applied to the disturbed and actively managed areas of the clay stockpile. No vegetation is present.

FODM3-1: Dry-Fresh Poplar Deciduous Forest

The dry-fresh poplar deciduous forest is located along the edge of the existing waste disposal area. The topography is relatively flat with moist soil. Trembling aspen (*Populus tremuloides*) dominates the semi closed canopy of this community, with red maple, red oak (*Quercus rubra*), and various shrub species also present within the unit. The sub-canopy, understory and ground layer are dominated by typical upland species such as riverbank grape (*Vitis riparia*), buckthorn (*Rhamnus spp*.), dogwood (*Cornus spp.*), pasture rose (*Rosa carolina*), goldenrod, and bedstraw (*Galium sp*.).

FODM9: Fresh-Moist Oak- Maple-Hickory Deciduous Forest

This forest type is located west of Brooks Road and in close proximity to swamps and is a dense deciduous community composed of shagbark hickory (*Carya ovata*), red maple, sugar maple (*Acer saccharum*), balsam poplar (*Populous balsamifera*), silver maple (*Acer saccharinum*), red oak, white pine (*Pinus strobus*), American beech (*Fagus grandifolia*), ironwood (*Ostrya virginiana*), and swamp white oak (*Quercus bicolor*). Due to the large area of this unit, ground vegetation varied throughout the area and included sensitive fern (*Onoclea sensibilis*), bracken fern (*Pteridium aquilinum*), spotted jewelweed (*Impatiens capensis*), Canada mayapple (*Podophyllum peltatum*), highbush cranberry (*Viburnum trilobum*), garlic mustard (*Alliaria petiolata*), trout lily (*Erythronium americanum*), Canada thistle (*Cirsium arvense*), black raspberry (*Rubus occidentalis*), woodland strawberry (*Fragaria vesca*), and lesser burdock (*Arctium minus)*.

FODM9-4: Fresh-Moist Shagbark Hickory Deciduous Forest

This low forested area is adjacent to one of the slough wetlands and is dominated by shagbark hickory with ironwood, white ash, red oak, red maple, and swamp white oak being present. The soil in this area is moist with a rolling topography. The groundcover includes goldenrod species, trout lily, running strawberry bush (*Euonymus obovatus*), ostrich fern (*Matteuccia struthiopteris*), and other herbaceous species.

THD: Deciduous Thicket

A small pocket of deciduous thicket was observed north of the existing fence line and is dominated by a gray dogwood (*Cornus racemosa)* with patchy canopy coverage of white ash (*Fraxinus americana)*, elm (*Ulmus spp.*), hawthorn (*Crataegus ssp*.), and red maple (*Acer rubrum)*. The ground layer is dominated by timothy grass (*Phleum pratense*), common milkweed (*Asclepias syriaca*), goldenrod (*Solidago sp.*), Canada bluegrass (*Poa compressa*), common cinquefoil (*Potentilla simplex*), oxeye-daisy (*Leucanthemum vulgare*), deptford pink (*Dianthus armeria*), and woodland sedge (*Carex blanda*).

THDM2-4: Gray Dogwood Deciduous Shrub Thicket

This mid-age transitional community is present in multiple locations throughout the LSA and is typically associated with the drier edges of wetlands. The area is similar to the cultural thicket (CUT1) community but is characterized by a dominant shrub cover of gray dogwood. Other community species indicative of an upland environment includes white ash, hawthorn, and goldenrod.

THDM2-11: Hawthorn Deciduous Shrub Thicket

This flat area of mineral soil is located in close proximity to an agricultural field. Hawthorn species dominate this landscape. Very few trees are located within this thicket and other species present include gray dogwood, serviceberry (*Amelanchier sanguinea*), and white pine.

THM: Mixed Thicket

Located to the east of the landfill property, this upland thicket is adjacent to two wetlands. A few large mature white pines have established, and hawthorn, gray dogwood, and European buckthorn are present within the sub canopy.

Wetland Communities

MAMM1: Graminoid Mineral Meadow Marsh

This unit has a broad range of vegetation composition in the shrub and ground vegetation layers. Within the wetland, narrow-leaved cattail (*Typha angustifolia*) and reed-canary grass (*Phalaris arundinacea var. arundinacea*) dominates. Vegetation along the edge of this unit includes common teasel (*Dipsacus fullonum)*, common chicory (*Cichorium intybus)*, red clover (*Trifolium pratense*), cow parsnip (*Heraleum maximum*), goldenrod, bird's-foot trefoil (*Lotus tenuis)*, serviceberry, gray dogwood, reed-canary grass, and oxeye daisy.

MAMM1-3: Reed–canary Grass Graminoid Mineral Meadow Marsh

Located directly to the east of Brooks Road and on the south-west corner of the landfill property, this marsh is dominated by reed-canary grass and very little other vegetation except for a small pocket of narrow-leaved cattail located within a ditch.

MAMM2-5: Purple Loosestrife Forb Mineral Meadow Marsh

Purple loosestrife (*Lythrum salicaria*), large-fruited bur-reed (*Sparganium eurycarpum*), buttonbush (*Cephalanthis occidentalis*), and wool grass (*Scirpus cyperinus*) create a dense understory in this community. This community provides a transition between the bur-reed mineral shallow marsh and a meadowsweet mineral deciduous thicket swamp (SWTM5-7) present in the LSA, north of the SSA.

MAMM3: Mixed Mineral Meadow Marsh

This marsh is located directly beside an agriculture field and receives surface water flow from the surrounding agricultural area due to its low elevation. Graminoid and forb species dominate, and the composition includes European reed grass (*Phragmites australis ssp. Australis)*, goldenrod, bird's-foot trefoil, common teasel, reed-canary grass, Queen Anne's lace (*Daucus carota*, and purple loosestrife. Narrow-leaved cattail, narrow-leaved meadowsweet (*Spiraea alba),* awl fruited sedge (*Carex stipata*), fowl mannagrass (*Glyceria striata),* broadleaf arrowhead (*Sagittaria latifolia*), duckweed (*Lemna minor*), and large-fruited bur-reed are also present within the understory layer.

MASO1-1: Cattail Organic Shallow Marsh

The cattail organic shallow marsh is a small community located at the base of the old rail line to the east of the landfill property. The marsh is comprised of organic soils and is dominated by narrow-leaved cattail. The other vegetation consisted of bog hemp (*Boehmeria cylindrica*), greater pond sedge (*Carex riparia*), and spotted jewelweed. This wetland is attached by a small channel which flows south to another wetland (MASO3).

MASO3: Mixed Organic Shallow Marsh

The mixed organic shallow marsh is comprised of organic soils and surface water with maximum depths over 0.5m in some areas. The vegetation community consists of phragmites (*Phragmites australis var. australis*), duckweed, water-plantain (*Alisma spp*.), and enchanter's nightshade (*Circaea canadensis ssp. canadensis*). Willow trees (*Salix spp*.) and shrubs are present throughout the wetland.

SWDM4: Mineral Deciduous Swamp

The mineral deciduous swamp is located within a forest community near agricultural fields. Aerial photographic interpretation was used to determine this habitat. Based on this interpretation, it is expected that this swamp is comprised of mineral soils and many deciduous tree species. Field investigations found red maple, trembling aspen, and balsam poplar. Gray dogwood was observed in the shrub layer, as well as sensitive fern and mosquito bulrush (*Scirpus hattorianus*). The ground layer was comprised of celery buttercup (*Ranunculus sceleratus*), red raspberry (*Rubus idaeus*), fowl mannagrass, and riverbank grape.

SWDM4-5: Poplar Mineral Deciduous Swamp

This habitat is found in multiple locations across the property, typically along the edge of the existing waste disposal facility. It is characterized as a transition between wetland and forest habitats. The majority of the canopy is located along the edge of the existing waste disposal property and is dominated by trembling aspen. Red maple, blue spruce (*Picea pungens)*, sugar maple, pin oak (*Quercus palustris*), white ash, and red oak all compose the tree canopy. Many shrub species, including red osier dogwood, hawthorn, and nannyberry (*Viburnum lentago*), are present within this unit. Spotted jewelweed, sensitive fern*,* narrow-leaved meadowsweet, reed-canary grass, yarrow (*Achillea millefolium*), white sweet clover (*Melilotus albus*), water-plantain, shallow sedge (*Carex lurida*), and common cinquefoil composes the dominant ground vegetation. Standing surface water and buttressed roots are present within the unit.

SWTM2-3: Gray Dogwood Mineral Deciduous Thicket Swamp

The gray dogwood mineral deciduous thicket swamp represents a mid-age transition community between the similarly characterized meadowsweet mineral deciduous thicket swamp (SWTM5-7*)* and the large mixed mineral meadow marsh (MAMM3). It is characterized by a robust sub-canopy dominated by gray dogwood. Specimens of red maple, speckled alder (*Alnus incana*), and common alder (*Alnus glutinosa*) form the canopy layer. The other species constituting the vegetation community are meadowsweet, sensitive fern, reed-canary grass, spotted jewelweed, boneset (*Eupatorium perfoliatum*), pussy willow (*Salix discolor*), and bottle brush sedge (*Carex hystericina*).

SWTM5: Mineral Deciduous Thicket Swamp

The mineral deciduous thicket swamp is present at multiple locations and is composed of primarily shrub species. Aerial photographic interpretation was used to determine this habitat in multiple areas but a field verified unit exits to the east of the landfill property. Species including gray dogwood, serviceberry, red osier dogwood, and hawthorn species are present within this unit. Ground vegetation includes narrow-leaved meadowsweet, sedge, rush, grass, and forb species. Small pockets of narrow-leaved cattail and reed-canary grass are also present.

SWTM5-1: Buttonbush Mineral Deciduous Thicket Swamp

The buttonbush mineral deciduous thicket swamp is surrounded by a large meadowsweet mineral deciduous thicket swamp (SWTM5-7). This community is comprised of thick sub-canopy of buttonbush and willow species. Bladderwort (*Utricularia vulgaris*), cypress-like sedge (*Carex pseudocyperus*), meadowsweet, swamp white oak, rye grass (*Lolium perenne*), soft-stemmed rush (*Juncus effusus*), and blue vervain (*Verbena hastata*) were also present.

SWTM5-7: Meadowsweet Mineral Deciduous Thicket Swamp

The meadowsweet mineral deciduous thicket swamp is characterized by a robust understory composed of obligate and facultative wetland species such as narrow-leaved meadowsweet, gray dogwood, and purple loosestrife. Ground

cover includes moss and fowl meadow grass (*Poa palustris*). The silty clay soil lacked horizons, but mottles were observed within the top 10 centimetres (cm) of the surface.

SWTO4-2: Gray Dogwood Organic Deciduous Thicket Swamp

The gray dogwood organic deciduous thicket swamp is a mid-age community present and is typically associated with wet low-lying habitat. The swamp is characterized by organic soils, deciduous community vegetation, and is driven by a dominant shrub cover of gray dogwood with a various species including sensitive fern, lily of the valley (*Convallaria majalis*), false solomon's seal (*Maianthemum racemosum ssp. racemosum)*, and narrow-leaved meadowsweet, all of which are indicative of a wetland environment.

3.2.3.1.2 ELC from 2016 Survey

Characteristics of each of the identified community types previously reported in the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017) is provided below. These communities are delineated in **Figure 5** outside of the “Field Verified – 2022” hatching.

Upland

MEGM4: Fresh Moist Graminoid Meadow

The fresh moist graminoid meadow is mainly characterized by mineral soil and low growing grass species. Garlic mustard, cow vetch (*Vicia cracca*), goldenrod, blueberry (*Vaccinium sp*.), Bebb's sedge (*Carex bebbi*), reed-canary grass, common teasel, lesser burdock, large-fruited bur-reed, wood sorrel (*Oxalis acetosella*), and other sedge, forb, and grass species are present within this meadow. Serviceberry, hawthorn (*Crataegus spp*.), and European buckthorn present along its periphery. A very small stream also runs through this unit.

MEMM4: Fresh-Moist Mixed Meadow

The fresh-moist mixed meadow is located in an upland area surrounding a pond excavated for agricultural use. The area has disturbed soils and is primarily composed of forb and graminoid species such as reed-canary grass, common milkweed, bird's-foot trefoil, Queen Anne's lace, asters (*Aster spp*.), and common chicory. No trees or shrubs are present.

FODM9-1: Fresh- Moist Oak – Sugar Maple Deciduous Forest

This upland forest interior landscape is surrounded by slough wetlands. Sugar maple, red maple, shagbark hickory, ironwood and swamp white oak compose the canopy of this forest. The understory is composed of fern species (Polypodiidae spp.*),* trout lily, mayapple, garlic mustard, spotted jewelweed, and Canada thistle.

FOMM1-2: Fresh-Moist White Pine-Hardwood Mixed Forest

This raised elevation area compared to the surrounding supports both coniferous and deciduous tree species and associated vegetation. The mineral soil is well drained and mature white pine, sugar maple, and white ash are present within this unit. Trout lily, mayapple, garlic mustard, and Canada thistle are also present.

TAGM1: Fine Mineral Coniferous Plantation

The fine mineral coniferous plantation is a mid-age treed community that reflects the surroundings and historic land use as a tree farm. The canopy is composed exclusively of blue spruce. The dominance within the sub-canopy is roughly divided between blue spruce and gray dogwood. Additional upland species include common teasel, goldenrod species, orchard grass (*Dactylis glomerata)*, broadleaf plantain (*Plantago major)* and common cinquefoil in the understory and as ground cover.

THDM3: Dry-Fresh Deciduous Hedgerow Thicket

This area is located south of the SSA and is situated along a rail bed. It is surrounded by marsh and agricultural fields. It has a raised topography compared to the surrounding landscape and is comprised of hawthorn species, common apple (*Malus pumila*), European buckthorn, amongst others.

Wetland

MAMO1: Graminoid Organic Shallow Marsh

The graminoid organic shallow marsh comprises a small wetland area located adjacent to an agricultural field and on the edge of a forest habitat. Vegetation includes primarily emergent sedge and graminoid species with small willow shrubs located on the periphery of the wetland.

MASO1: Graminoid Organic Shallow Marsh

The graminoid organic shallow marsh is a large wetland area dominated by tall robust vegetation. Standing water was present during multiple field surveys. Species composition is dominated by reed-canary grass, broad leaved water plantain (*Alisma subcordatum*), duckweed, pondweed (*Potamogeton sp*.), Queen Anne's lace, purple loosestrife, and vetch species (*Vicia spp.*).

SWDO3: Organic Deciduous Swamp

Sloughs with deep organic soils are present in most areas of the maple organic deciduous swamp unit. The canopy layer is dominated by red maple, American beech, shagbark hickory, and sugar maple. Small sporadic open water habitats are present, and many wetland sedges, ferns, and aquatic species are present. These include sensitive fern, bracken fern, spotted jewelweed, duckweed, false solomon's seal, narrow-leaved meadowsweet, etc.

SWD: Deciduous Swamp

This swamp is a diverse community comprised of many small tree stands containing deciduous tree species including red maple, shagbark hickory, trembling aspen, ironwood, hawthorn species, and burr oak (*Quercus macrocarpa*). Shrub species include gray dogwood, red osier dogwood, and serviceberry, among others.

SWT: Thicket Swamp

This swamp is a diverse community with small tree stands. It contains small patches of deciduous trees including trembling aspen, red maple, American beech, and ironwood. Shrub species dominate the landscape and include gray dogwood, red osier dogwood, and serviceberry, among others.

SWT02: Willow Organic Deciduous Thicket Swamp

The willow organic deciduous thicket shrub wetland is a small wetland with organic soil and an open water feature surrounded by willow tree and shrub species. This wetland overflows across a farmed field into a marsh wetland during the wet season. Other vegetation includes serviceberry, gray dogwood, duckweed, and graminoid species.

OAW: Open Water

Small open water habitats are present within the LSA, located near agriculture fields. These open water habitats were historically created by farmers for irrigation of crops within the surrounding fields. These ponds are uniform in shape and have little aquatic vegetation present.

3.2.3.2 Flora

A total of 139 vascular plants were identified to species level during field investigations, with one identified to genus (hawthorn [*Crataegus sp.*]). Of the species identified, 87 are native, 52 are non-native. 67 of the native species for

which information is available have S-Ranks[2] of 'S5', indicating they are 'secure' in the province. Virginia creeper, southern water-plantain, American reed, and Black walnut have an S-Rank of 'S4?' indicating they are 'apparently secure' in the province, however some uncertainty about the assigned rank exists. 10 species possess a ranking of S4 indicating that they are uncommon but not rare, with some cause for long-term concern due to declines or other factors.

81 of the native species for which information is available have co-efficient of conservatism[3] (CC) values of 0-6, indicating they are tolerant to moderately tolerant of disturbance. Six species possess a ranking of 7-9 which indicates that they have a low tolerance for disturbance.

No SAR plants were identified during the field investigation.

A list of vascular plant species identified during field investigations is provided in **Appendix C**.

3.2.4 Herpetofauna

Herpetofauna encompasses all amphibians and reptiles. Calling amphibian monitoring was conducted and is further discussed in **Section 3.2.4.1**. Reptile-specific field surveys were not conducted during field investigations. However, the Ontario Reptile and Amphibian Atlas was reviewed, and incidental species observations were recorded at each field visit.

Herptile species identified in the Ontario Reptile and Amphibian Atlas as occurring within the Study Areas include:

- American bullfrog (*Lithobates catesbeianus*)
- American toad (*Anaxyrus americanus*)
- Blanding's turtle (*Emydoidea blandingii*)*
- Blue-spotted salamander (*Ambystoma laterale*)
- Dekay's brownsnake (*Storeria dekayi*)
- Eastern gartersnake (*Thamnophis sirtalis sirtalis*)
- Eastern Milksnake (*Lampropeltis triangulum*)
- Eastern red-backed salamander (*Plethodon cinereus*)
- Eastern ribbonsnake (*Thamnophis sauritus*)
- Gray treefrog (*Hyla versicolor*)
- Green frog (*Lithobates clamitans*)
- Midland painted turtle (*Chrysemys picta marginata*)
- Northern leopard frog (*Lithobates pipiens*)
- Northern map turtle (*Graptemys geographica*)
- Northern watersnake (*Nerodia sipedon sipedon*)
- Red-bellied snake (*Storeria occipitomaculata*)
- Red-spotted newt (*Notophthalmus viridescens viridescens*)
- Smooth greensnake (*Opheodrys vernalis*)
- Snapping turtle (*Chelydra serpentine*)
- Spotted salamander (*Ambystoma maculatum*)

[2] Provincial (or Subnational) ranks are used by the Natural Heritage Information Centre (NHIC) to set protection priorities for rare species and natural communities. These ranks are not legal designations. Provincial ranks are assigned in a manner similar to that described for global ranks, but consider only those factors within the political boundaries of Ontario.

[3] Rank of 0 to 10 based on plant's degree of fidelity to a range of synecological parameters: (0-3) Taxa found in a variety of plant communities; (4-6) Taxa typically associated with a specific plant community but tolerate moderate disturbance; (7-8) Taxa associated with a plant community in an advanced successional stage that has undergone minor disturbance; (9-10) Taxa with a high fidelity to a narrow range of synecological parameters (Oldham et al., 1995).

– Spring peeper (*Pseudacris crucifer*)
– Western chorus frog (*Pseudacris triseriata*), Carolinian population
– Wood frog (*Lithobates sylvaticus*)

Note: * denotes historical record (pre-2000)

American bullfrog, eastern gartersnake, eastern milksnake, green frog, northern leopard frog, northern watersnake, eastern red-backed salamander, and red-bellied snake were observed during 2020 – 2022 field investigations. Additional calling amphibians recorded in the LSA are detailed in **Section 3.2.4.1**. Blanding's turtle, snapping turtle, and Dekay's brownsnake were observed during 2013 – 2015 LSA field surveys (GHD 2017).

3.2.4.1 Calling Amphibian Surveys

Six calling amphibian stations were surveyed in the North, East, and West Lands according to the Great Lakes Marsh Monitoring Protocol (BSC 2009) in spring 2022 (**Figure 6**). All stations had detections of calling amphibians. Results of the calling amphibian surveys during 2020 – 2022 can be found in **Appendix D**.

The composition of species detected during the amphibian surveys is representative of the amphibian population in the adjacent areas, where suitable habitat exists. Surveys in the North and East Lands confirmed the presence of American bullfrog, American toad, gray treefrog, green frog, northern leopard frog, spring peeper, and western chorus frog. Surveys in the West Lands confirmed the presence of the same species, with the exception of American bullfrog. In total, eight species of calling amphibians were documented in the LSA.

Each of the species recorded during 2020 – 2022 calling amphibian surveys had been previously documented in the vicinity as part of the *Terrestrial and Aquatic Environment Assessment Report for the Brooks Road Landfill Site Vertical Capacity Expansion Environmental Assessment* (GHD 2017). No species listed under the provincial ESA or the federal SARA were recorded during calling amphibian surveys.

3.2.5 Birds

Breeding bird surveys were conducted on June 10, June 27, and July 10, 2022, in the East Lands. A total of 61 species were detected during the surveys, 44 of which displayed evidence of breeding. A list of the species detected with evidence of breeding is provided in **Appendix E**.

The SM1 recorder was deployed in the North Lands from June 10 – July 10, 2022, at the location identified on **Figure 6**. For consistency, the recordings were analyzed by the avian ecologist who completed the in-field breeding bird surveys. A list of all species detected by the SM1 is provided in **Appendix E**. The SM1 could only document presence of singing species and cannot provide visual observation of species.

In total, 71 species of birds were observed in the LSA and SSA during 2022 breeding bird surveys by GHD ecologists. Four of these species are SAR: barn swallow, eastern wood-pewee (*Contopus virens),* Canada warbler (*Cardellina canadensis*), and wood thrush (*Hylocichla mustelina*). Least bittern (*Ixobrychus exilis)* was heard vocalising within the East Lands in 2014 (GHD 2017). This species was not detected during the 2022 surveys within the LSA or SSA. Species at risk are discussed in greater detail in **Section 3.2.8**.

3.2.6 Mammals

Mammal-specific field surveys were not conducted as part of the project, but incidental observations were recorded. During field investigations big brown bat (*Eptesicus fuscus*), eastern cottontail (*Sylvilagus floridanus*), northern raccoon (*Procyon lotor*), red fox (*Vulpes vulpes*), striped skunk (*Mephitis mephitis*), white-tailed deer (*Odocoileus virginianus*), and unidentified bats were observed.

3.2.7 Incidental Wildlife Observations

Wildlife observations were collected during each field visit in addition to breeding bird and amphibian surveys. A list of incidental faunal species observations can be found in **Table 3.3**.

Table 3.3 Incidental wildlife observed within the Study Areas from 2020 to 2022

Species Observed		S-Rank	Conservation Status

3.2.8 Species at Risk

Numerous SAR have been observed within the Study Areas or have been flagged through agency correspondence or background review as having the potential occur within the Study Areas (**Table 3.4**). Incidental observations of all species, including any SAR encountered, were collected during field investigations and were detailed previously in **Table 3.3**. SAR species-specific surveys were not completed for a number of reasons including:

– Natural areas within the SSA are very small and limited to a small section of the southern boundary of the SSA. This area provides little available habitat for any of the listed SAR based on its proximity to the Site operations, small size, and presence of a chain link fence at the SSA boundary.

– Mitigation measures currently in place to dissuade wildlife access/use of the landfill property include:

- Chain link fence is present around the perimeter of the property which dissuades larger reptile and mammal access to the SSA
- Silt fence along the perimeter of the property is an effective deterrent for small reptiles, mammals, and amphibian access to the SSA
- Daily landfilling activities (e.g., noise, human presence, heavy machinery) also provide deterrents for use of the SSA by wildlife

Operational practices (i.e., daily cover) further act to deter wildlife use of the SSA.

Table 3.4 Species at Risk Summary

Species		Observed within the Local Study Area	Conservation Status

Species		Observed within the Local Study Area	Conservation Status	
Common Name	Scientific Name		SARO	SARA
Notes				
* Observed within the SSA ^ Observed within the LSA during 2013 – 2015 surveys (GHD 2017) SARO: Species at Risk in Ontario (provincial) SARA: Species at Risk Act (federal)				

Background review found 29 SAR which have historically been recorded in the Study Areas. Twenty-four species with a moderate or high likelihood of occurrence within the LSA are discussed further. The complete list of SAR and their potential to occur is provided in **Appendix F**.

3.2.8.1 Endangered Species

Birds

Red-headed woodpecker (*Melanerpes erythrocephalus*) is a provincially and federally designated endangered species with a moderate likelihood of occurrence within the LSA due to suitable habitat being present.

Yellow-breasted chat (*Icteria virens virens*) is a provincially and federally endangered species and has a moderate likelihood of occurrence as suitable habitat is present within the LSA.

Mammals

Little brown myotis (*Myotis lucifugus*), tri-colored bat (*Perimyotis subflavus*), and northern myotis (*Myotis septentrionalis*) are all provincially and federally endangered species with a high likelihood of occurrence within the LSA due to the presence of suitable habitat (i.e., trees for roosting). Eastern small-footed myotis (*Myotis leibii*) is provincially endangered, not listed federally, and has a moderate likelihood of occurrence within the LSA due to suitable habitat (i.e., rocky areas for roosting) potentially being present.

Vascular Plants

American chestnut (*Castanea dentata*) is listed as endangered provincially and federally. This species has a moderate likelihood of occurrence as suitable habitat is present within the LSA; however, was not detected during any of the field investigations.

Black ash (*Fraxinus nigra*) is listed as endangered provincially and not listed federally. Protection under the ESA has been suspended until January 26, 2024, under O. Reg 23/22 in order to document a proper approach and consultation with all parties. This species was observed by GHD in 2016 in the LSA and has a moderate likelihood of occurrence as suitable habitat is present; however, was not detected during any of the field investigations within the SSA.

Butternut (*Juglans cinerea) is a provincially and federally endangered species.* Butternut has a moderate likelihood of occurrence as suitable habitat is present within the LSA; however, was not detected during any of the field investigations.

Eastern flowering dogwood (*Cornus florida) is a provincially and federally endangered species.* Eastern flowering dogwood has a moderate likelihood of occurrence as suitable habitat is present within the LSA; however, was not detected during any of the field investigations.

3.2.8.2 Threatened Species

Birds

Bank swallow (*Riparia riparia*) is a provincially and federally threatened species. They have a moderate likelihood of occurrence as potentially suitable habitat is present within the LSA.

Barn swallow (*Hirundo rustica*) is a provincially and federally threatened species. Barn swallows were observed throughout the Study Areas on multiple occasions and have a high likelihood of occurrence within the Study Areas due to suitable foraging habitat.

Cerulean warbler (*Setophaga cerulea)* is a provincially threatened and federally endangered species with a moderate likelihood of occurrence within the LSA due to the presence of potentially suitable habitat.

Least bittern (*Ixobrychus exilis*) is a provincially and federally threatened species with a high likelihood of occurrence within the LSA due to the presence of suitable habitat. Least bittern was observed vocalising in the East Lands during 2014 surveys (GHD 2017).

Reptiles

Blanding's turtle (*Emydoidea blandingii*) is a provincially and federally threatened species. A Blanding's turtle was observed on Brooks Road in the vicinity of the entrance of the landfill, on June 12, 2014, during wetland delineation with GRCA (GHD 2017). This species has a high likelihood of occurrence within the LSA due to suitable habitat being present.

3.2.8.3 Special Concern Species

These species do not receive protection under the ESA or SARA; however, populations and habitats of ESA-listed special concern species may be considered Significant Wildlife Habitat. Impacts to these species should be avoided where possible by avoiding natural habitat features beyond the SSA.

Birds

Canada warbler (*Cardellina canadensis*) is a provincially designated special concern species, and a federally designated threatened species. Canada warbler was detected in the North Lands via the SM1 and has a high likelihood of occurrence within the LSA.

Eastern wood-pewee (*Contopus virens*) is a provincially and federally designated special concern species. Eastern wood-pewee was detected on multiple occurrences during the breeding bird surveys. This species has a high likelihood of occurrence due to suitable habitat being present within the LSA.

Wood thrush (*Hylocichla mustelina*) is a provincially designated special concern species, and a federally designated threatened species. Wood thrushes were detected on during the breeding bird surveys and SM1 audio recordings. They have a high likelihood of occurrence within the LSA due to suitable habitat being present.

Insects

Monarch (*Danaus plexippus*) is listed as special concern provincially and federally and was observed within the LSA. This species is considered to have a high likelihood of occurring as their larval foodplant, common milkweed, is present within the Study Areas.

Reptiles

Eastern ribbonsnake (*Thamnophis sauritus*) are a provincially and federally designated special concern species. *They* have a high likelihood of occurrence as suitable habitat is present within the LSA.

Midland painted turtle (*Chrysemys picta marginata*) is a federally designated special concern species and is currently under consideration for provincial designation. Midland painted turtles have a high likelihood of occurrence within the LSA as suitable habitat is present.

Eastern milksnake (*Lampropeltis triangulum*) is listed as not at risk provincially but is listed as special concern federally. Eastern milksnake was observed within the SSA and have a high likelihood of occurring within the LSA due to suitable habitat being present. Wildlife exclusion fencing has since been installed to limit the presence of wildlife within the SSA and is maintained as part of mitigation measures associated with the 2019 facility expansion (Notice of Approval EA File number 03-08-02 (Approval), issued in 2019 under the *Environmental Assessment Act*).

Northern map turtle (*Graptemys geographica)* is listed as special concern provincially and federally. This species has a high likelihood of occurring within the LSA due to suitable habitat being present.

Snapping turtle (*Chelydra serpentina)* is listed as special concern provincially and federally. A snapping turtle was observed within the LSA during 2013 field investigations (GHD 2017) and has a high likelihood of occurring within the LSA due to suitable habitat being present.

3.3 Summary of Existing Conditions

The LSA is a mix of agricultural, woodlands, wetlands and roads, the features of which have been investigated or characterized as required for various Site development activities of the past 10 years. Updated habitat characterization and species information has been completed to support the proposed capacity expansion Streamlined EA. This *Natural Environment Assessment Report* has presented the existing conditions of the natural environment including vegetation communities and flora, wildlife, species of conservation concern and SAR, and designated areas within the Study Areas.

Within the SSA and LSA there are provincially significant wetlands (North Cayuga Swamp Wetland Complex), white-tailed deer wintering areas, and lands regulated by the GRCA and the NPCA. Within the LSA there is also an ANSI (North Cayuga Slough Forest). Thirty-nine ecological land classification community classes are represented within the LSA and include aquatic, swamp, marsh, meadow, thicket, forest, transportation and utilities, and cultural systems. Species composition consists of common native and non-native trees, shrubs, and herbaceous species.

Targeted surveys for calling amphibians and breeding birds were conducted, with observed incidental species recorded during every field visit. Through these surveys, several provincially listed SAR were recorded:

– Barn swallow (*Hirundo rustica*) – threatened
– Black ash (*Fraxinus nigra*) – endangered (observed in LSA during 2016 surveys [GHD 2017])
– Blanding's turtle (*Emydoidea blandingii*) – threatened (observed in LSA during 2014 surveys [GHD 2017])
– Canada warbler (*Cardellina canadensis*) – special concern
– Eastern wood-pewee (*Contopus virens*) – special concern
– Least bittern (*Ixobrychus exilis*) – threatened (observed in LSA during 2014 surveys [GHD 2017])
– Monarch (*Danaus plexippus*) – special concern
– Snapping turtle (*Chelydra serpentina*) – special concern (observed in LSA during 2013 surveys [GHD 2017])
– Wood thrush (*Hylocichla mustelina*) – special concern

Numerous other SAR species have the potential to use habitats within the Study Areas. Endangered or threatened species such as red-headed woodpecker, yellow-breasted chat, SAR bats, American chestnut, black ash, butternut, eastern flowering dogwood, bank swallow, bank swallow, cerulean warbler, least bittern, and Blanding's turtle have requirements under the ESA and the SARA. Provincial special concern species such as Canada warbler, eastern wood-pewee, wood thrush, monarch, eastern ribbonsnake, northern map turtle, and snapping turtle, and their populations and habitats may qualify as Significant Wildlife Habitat.

4. Potential Effects, Mitigation Measures & Net Effects

A Project Description, which includes proposed engineering design figures, was prepared so that potential environmental effects and mitigation measures could be identified. The following subsections provide a general summary of the proposed undertaking.

4.1 Description of Project Components and Activities

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours, as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in **Table 4.1**.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted by 30 m. East and west ditches will extend to maintain full perimeter ditch.
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Methodology and Investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

4.2.1 Net Effects Assessment Methodology

The assessment of the proposed capacity expansion was conducted in two steps:

– **Step 1: Confirm Screening Criteria and Indicators/Measures**
Prior to undertaking the net effects assessment, the Natural Environment screening criteria, indicators, and measures were reviewed and confirmed for application to the proposed capacity expansion.

– **Step 2: Undertake the Net Effects Analysis**
With the screening criteria, indicators, and measures confirmed through the preceding step, a net effects analysis of the proposed capacity expansion was carried out consisting of the following activities:

- Identify potential effects (based on measures) on the Natural Environment;
- Develop and apply avoidance/mitigation/compensation/enhancement measures; and
- Determine net effects on the Natural Environment.

4.2.2 General Assumptions

The following evaluation was carried out under the assumption that the September 2022 Design and Operations Report (GHD 2022) for the Brooks Road Landfill Site depicts the most up-to-date conceptual design for the proposed capacity expansion. Should the conceptual design change, the need for mitigation and the potential for net effects would need to be reassessed.

4.2.3 Screening Criteria and Indicators

Table 4.2 presents the screening criteria and indicators relevant to the Natural Environment.

Table 4.2 Screening Criteria and Indicators Relative to the Natural Environment

Screening Criteria	Indicators	Rationale	Data Sources
Negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat	– Predicted impact on flora and fauna including rare (vulnerable), threatened, or endangered species – Predicted impact on flora and fauna habitat (terrestrial and aquatic)	Increased capacity of the landfill may disturb the functioning of natural flora and fauna habitats (terrestrial and aquatic), including rare, threatened, or endangered species	– Site surveys – Published data sources
Negative effects on designated wetlands	– Predicted changes in water quality – Predicted impact on wetland habitat – Predicted impact on flora and fauna	Increased capacity of the landfill may disturb the functioning of designated wetlands and other aquatic habitats and species, including rare, threatened, or endangered species	– Site surveys – Published data sources

Screening Criteria	Indicators	Rationale	Data Sources
Negative effects on wildlife habitat, populations, corridors, or movement	– Predicted impact on wildlife habitat – Predicted impact on wildlife populations – Predicted impact on habitat linkages within the Local Study Area	Increased capacity of the landfill may disturb the functioning of natural wildlife habitats, cause a population increase or decrease, or impact habitat linkages (affecting wildlife corridors or movement)	– Site surveys – Published data sources

4.3 Natural Environment Net Effects

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a "Yes" answer was given in the Screening Criteria Checklist) for those Natural Environment criteria which might be affected by the project as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Areas would change as a result of the construction and operation of the proposed undertaking.

As described in **Section 2** (**Table 2.1**), a “Yes” was applied to the following Natural Environment criteria:

– Cause negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat?
– Cause negative effects on designated wetlands?
– Cause negative effects on wildlife habitat, populations, corridors, or movement?

With respect to the above criteria, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.3.1 Potential Effects on the Natural Environment

4.3.1.1 Cause Negative Effects on Rare (Vulnerable), Threatened or Endangered Species of Flora or Fauna or their Habitat

There are several rare (vulnerable), threatened or endangered species of flora and fauna or their habitat within the LSA and/or SSA. The proposed capacity expansion could have a negative effect on these species and/or habitats, potentially causing the species to become extirpated (i.e., locally extinct).

4.3.1.2 Cause Negative Effects on Designated Wetlands

The proposed capacity expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on designated wetlands. PSWs are present on all sides of the Site and are also located within the southeastern boundary of the SSA. The proposed capacity expansion could cause negative effects to the PSWs through changes in water quality, impacts to wetland habitat, and impacts to flora and fauna species.

4.3.1.3 Cause Negative Effects on Wildlife Habitat, Populations, Corridors, or Movement

The proposed capacity expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on wildlife habitats, populations, corridors, or movements. The MNRF’s NHIC mapping delineates Wildlife Activity Area (WAA; white-tailed deer wintering area) throughout most of the SSA and LSA. The proposed capacity expansion will not reduce the available WAA.

4.3.2 Mitigation Measures

There are a number of existing mitigation measures in place to dissuade wildlife access to the existing landfill Site and to prevent human/wildlife conflicts. Chain link fence is present around the perimeter of the property, which dissuades larger reptile and mammal access to the Site. Based on the proximity to the PSW, a wildlife exclusion fence was installed in December 2021 within the chainlink fence as an effective deterrent for small reptile, amphibian, and mammal access to the Site. Also, in December 2021, a new silt fence was installed along the northern perimeter of the property and at several locations around the Site where run-off potential is high. There are also very limited natural areas on the landfill Site itself and daily landfilling activities (e.g., noise, human presence, heavy machinery) also provide deterrents for wildlife use of the Site. Other operational practices (i.e., daily cover) further act to deter wildlife use of the Site.

General Best Management Practices (BMPs) for continued operation of the landfill should include:

– Notify Site operators and delivery contractors of the presence of reptiles and amphibians in the surrounding areas. This includes visual identification tools for SAR common to the area.
– Any wildlife incidentally encountered during Site operation activities will not be knowingly harmed and will be allowed to move away from the area on its own if at all possible.
– In the event that an animal encountered during Site operation activities does not move from the area, or is injured, the Site Supervisor will be notified.
– In the event that the animal is a known or suspected SAR, the Site Supervisor will contact MNRF SAR biologists for advice.
– Wildlife exclusion fence and erosion and sediment controls shall be maintained until all disturbed areas of the Site, including the pond and swales, have fully stabilized and vegetated areas have achieved 70 percent of the native background density of growth. The condition of all swales, culverts, vegetation, infiltration basin outlet, and outflow channels leading to the Brooks Road drainage ditch and off Site will be noted at regular intervals.

4.3.3 Net Effects

The proposed capacity expansion will migrate the northern landfill perimeter north by approximately 30 m. This land is already within the Site boundary and within the chainlink, wildlife exclusion, and silt fences; as such, net effects are anticipated to be negligible. **Table 4.3** details the potential effects, mitigation measures, and net effects on the Natural Environment.

Table 4.3 Natural Environment Potential Effects, Mitigation Measures, and Net Effects

Screening Criteria	Indicators	Potential Effects	Mitigation Measures	Net Effects
Negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat	Predicted impact on flora and fauna including rare (vulnerable), threatened, or endangered species	Potential to cause species to become extirpated (i.e., locally extinct)	Chainlink and wildlife exclusion fence to prevent fauna entering Site No clearing to be conducted outside of the Site boundary	No net effects to flora and fauna within the Site and Local Study Areas
	Predicted impact on flora and fauna habitat	Clearing and grubbing may cause destruction to flora and fauna habitat	No clearing or grubbing to be conducted outside of the Site boundary	No net effects to flora and fauna habitat within the Site and Local Study Areas

Screening Criteria	Indicators	Potential Effects	Mitigation Measures	Net Effects
Negative effects on designated wetlands	Predicted changes in water quality	Water quality could deteriorate with the migration of sediment from the landfill into the wetland	Silt fence is installed in areas of possible sediment migration	No net effects to water quality in designated wetlands within the Site and Local Study Areas
	Predicted impact on wetland habitat	Wetland habitat could deteriorate with the migration of sediment from the landfill into the wetland	Silt fence is installed in areas of possible sediment migration	No net effects to wetland habitat in designated wetlands within the Site and Local Study Areas
	Predicted impact on flora and fauna	Migration of sediment from the landfill into the wetland may have a negative impact on flora and fauna	Silt fence is installed in areas of possible sediment migration	No net effects to flora and fauna in designated wetlands within the Site and Local Study Areas
Negative effects on wildlife habitat, populations, corridors, or movement	Predicted impact on wildlife habitat	WAA (white-tailed deer wintering area) is present throughout most of the SSA and LSA and the increased footprint may reduce the available WAA	Existing chainlink and wildlife exclusion fence prevent fauna entering Site. The proposed expansion is confined to the fenced Site	No net effects on wildlife habitat within the Site and Local Study Areas
	Predicted impact on wildlife populations	The proposed capacity increase may lead to reduced or increased wildlife populations	The proposed expansion is confined to the existing Site boundary	No net effects on wildlife populations within the Site and Local Study Areas
	Predicted impact on habitat linkages within the Local Study Area	The proposed capacity increase may impact habitat linkages in the Local Study Area	The proposed expansion is confined to the existing Site boundary	No net effects on habitat linkages within the Site and Local Study Areas

5. Monitoring Requirements and Additional Approvals

To ensure that the mitigation measures identified in **Section 4** are implemented as envisioned, a strategy and schedule was developed for monitoring environmental effects. With these mitigation measures and monitoring requirements in mind, commitments have also been proposed for ensuring that they are carried out as part of the construction, operation, and maintenance of the proposed undertaking.

5.1 Monitoring Requirements

5.1.1 Calling Amphibian Monitoring

Calling amphibians are recommended to be monitored annually to confirm there is no migration of sediment from the proposed capacity expansion (i.e., from grading throughout the SSA, capping of the landfill) is not causing negative impacts to the wildlife inhabiting the surrounding wetlands. Monitoring should focus on Locations 1 through 4, as the potential impacts to the natural environment at Locations 5 and 6 are considered to be negligible given their distance from the SSA. These annual monitoring events should be conducted during Year 1, Year 2, and every three years following for a minimum of 4 monitoring events, commencing in the first year of construction. When conducted in

accordance with the Marsh Monitoring Protocol (BSC 2009), the results will build upon the findings detailed in **Section 3.2.4.1**.

5.1.2 Surface Water Quality Monitoring

The Site currently implements a surface water monitoring program based on the requirement of ECA No. A110302. The surface water monitoring program includes water quality monitoring and surface water flow measurements. This program consists of a network of nine monitoring stations (one on-Site and eight off-Site) indicated in **Figure 6** and is conducted to confirm run-off is not causing negative impacts to the wetland. Water quality monitoring and surface water flow measurements at all of the surface water stations take place on a quarterly basis (generally March, May, August, December) with an attempt to correlate the surface water monitoring with rainfall events. Continuation of this program provides a reasonable monitoring effort for potential effects monitoring. Further information on surface water quality monitoring is available in the *Design and Operations Report* (GHD 2022).

5.1.3 Fencing Inspections

The following measures will be conducted to mitigate potential effects associated with the perimeter wildlife exclusion/silt fence and confirm that it is effective:

– Routine inspections of the integrity of the perimeter wildlife exclusion/silt fence. Inspections are to be conducted quarterly with copies of the inspection reports maintained on-Site for 2 years
– Incidental observations of wildlife exclusion/silt fence or perimeter chainlink fence disrepair and/or evidence of wildlife attempting to enter the SSA should be reported immediately to the Site Supervisor or Site Manager and addressed in a timely fashion
– Any fencing disrepair is to be addressed by BRE in a timely fashion

5.2 Additional Approvals

No additional approvals are anticipated for Natural Environment outside of the EA process.

6. Conclusion

The provincially significant North Cayuga Swamp Wetland Complex, white-tailed deer wintering areas and lands regulated by the GRCA and the NPCA are present within the LSA and SSA. The North Cayuga Slough Forest (ANSI) is also present within the LSA.

The Study Areas present at Brooks Road Landfill have historically contained numerous SAR species, with several provincially listed SAR species recorded within the LSA and/or SSA. Several Endangered or Threatened SAR species have the potential to use habitats within the Study Areas and have requirements under the ESA and the SARA. Provincial special concern species and their populations and habitats may qualify as Significant Wildlife Habitat.

The proposed capacity expansion will migrate the northern active landfill perimeter north by approximately 30 m. Given that land is already within the Site boundary and subject to mitigation measures (i.e., chainlink, wildlife exclusion, and silt fences), net effects are anticipated to be negligible.

Good Afternoon,

I hope this email finds you well. I have attached the information that we have on file for the North Cayuga Swamp Wetland Complex (PSW).

Additionally, there is also some fisheries information available for Pike Creek that is near this site. This fisheries information will also be accessible through Land Information Ontario.

"*Pike Creek:*
Thermal Regime: warm
ARA Fish Community Summary:
Black Crappie, Bluegill, Bluntnose Minnow, Brook Stickleback, Brown Bullhead, Central Mudminnow, Common Shiner, Creek Chub, Gizzard Shad, Golden Shiner, Green Sunfish, Largemouth Bass, Logperch, Northern Pike, Pumpkinseed, Rock Bass, Sunfishes, and White Sucker."

Please let me know if there is anything else that you require.

Have a great day,

Nate Sabourin

Subject: Background Information Request - Cayuga

Good morning,

GHD would like to request the following list of background information from the Ministry of Northern Development, Mines, Natural Resources and Forestry (NDMNRF) to assist in the Brooks Road Landfill Project, if available. The project area is located at 160 Brooks Road, Cayuga, Ontario, N0A 1E0 (**Figure 1**).

Through an initial review of Natural Heritage Information Centre (NHIC), Land Information Ontario (LIO), and other databases, we have identified the following Natural Areas within the vicinity of our study area:

– North Cayuga Swamp Wetland Complex (Evaluated – Provincial)
– Wooded Area (NDMNRF)
– Mixed Wader Nesting Colony (Wildlife Concentration Area, NHIC)
– White-tailed Deer Wintering Area (Stratum 2; Wildlife Values Area, Provincial Natural Heritage [PNH])
– Growth Plan Natural Heritage System (PNH)

We are seeking any additional information such as existing fisheries data, Natural Heritage Information, Wetland Evaluation Reports, and any other data you feel is valuable for this assessment.

In fulfillment of this work, GHD is also contacting the Ministry of Environment Conservation and Parks (MECP), the Grand River Conservation Authority (GRCA), and the Niagara Peninsula Conservation Authority (NPCA) to ensure our data is complete.

Please let us know if you have any questions or require any further information. We look forward to your response to our request.

Hi Amy,

The information that NPCA can provide will be limited as the property is located outside our jurisdiction. That being said, NPCA mapping shows **Provincially Significant Wetland, North Cayuga Swamp Wetland Complex** surrounding the study area at all four directions. Our mapping also identifies a watercourse and a pond at the southern portion of the property.

Hope this helps!
Theresa

Subject: RE: Background Information Request - Cayuga

Thanks Adam.

We've included NPCA in our consultation due to the vey close proximity to the watershed (see updated image with CA boundary) Better to be safe than sorry, right?!

Thanks again for your help with this.

Hi Amy,

Thanks for reaching out. I'd note that the property you've referenced is not within the NPCA's watershed and we therefore are unlikely to have much information to provide.

I've passed your request onto Theresa Bukovics (cc'd). Theresa will get back to you with any information that we may have.

Kind regards,
Adam

Subject: Background Information Request - Cayuga

Good morning Adam and Kim,

If required, please forward this email to the appropriate members of your team.

GHD would like to request the following background information from the Niagara Peninsula Conservation Authority (NPCA) to assist in the Brooks Road Landfill Project, if available. The project area is located at 160 Brooks Road, Cayuga, Ontario, N0A 1E0 (**Figure 1**).

Ecology:

- Ecological Land Classification data (if separate from GIS layers)
- Flora and fauna species
- Stream benthic invertebrates data
- Fisheries data
- Any reports/previous ecological studies completed within and in the vicinity of the study area

If possible, GHD also requests to review designs and reports regarding any ongoing NPCA projects within the project limits. Review of any designs will be crucial to ensure that watercourse remediation recommendations integrate with any ongoing NPCA work.

In fulfillment of this work, GHD is also contacting the Ministry of Northern Development, Mines, Natural Resources and Forestry (NDMNRF), the Ministry of Environment Conservation and Parks (MECP), and the Grand River Conservation Authority (GRCA) to ensure our data is complete.

Please let us know if you have any questions or require any further information. We look forward to your response to our request.

Due to the COVID-19 pandemic, the NPCA has taken measures to protect staff and public while providing continuity of services. The NPCA main office is open by appointment only with limited staff, please refer to the Staff Directory and reach out to the staff member you wish to speak or meet with directly. Our Conservation Areas are currently open, but may have modified amenities and/or regulations.

Updates regarding NPCA operations and activities can be found at Get Involved NPCA Portal, or on social media at NPCA's Facebook Page & NPCA's Twitter page.

Hi Amy,

There should be a number of background studies for this specific property relating to the refurbishment of the landfill, a proposed expansion of the landfill, and its license renewal.

We have information that:

- Portions of the North Cayuga Swamp Provincially Significant Wetland Complex are located on site and immediately adjacent to it.
- MNDMNRF has portions of the site and adjacent lands mapped as White-tailed deer wintering area
- The site is at the headwater catchment area of Pike Creek, further downstream the watercourse is mapped by DFO for Mapleleaf Mussel (Quadrula quadrula)
- A number of ranked species have potential to be located on or adjacent to the site. One of our watershed ecologists has personally observed Blanding's Turtles (Endangered) at the site. Other potential species include but not limited to
    - Eastern Meadowlark - Threatened
    - Bobolink - Threatened
    - Wood Thrush - Threatened
    - Eastern Flowering Dogwood - Endangered
    - Cerulean Warbler - Endangered

It should also be noted that the site is on the watershed divide between our jurisdiction and that of the Niagara Peninsula Conservation Authority. We recommend reaching out to them as well, if you haven't already.

Subject: Background Information Request - Cayuga

Good morning,

Please forward this email to the appropriate members of your team.

GHD would like to request the following background information from the Grand River Conservation Authority (GRCA) to assist in the Brooks Road Landfill Project, if available. The project area is located at 160 Brooks Road, Cayuga, Ontario, N0A 1E0 (**Figure 1**).

Ecology:

- Ecological Land Classification data (if separate from GIS layers)
- Flora and fauna species
- Stream benthic invertebrates data
- Fisheries data
- Any reports/previous ecological studies completed within and in the vicinity of the study area

If possible, GHD also requests to review designs and reports regarding any ongoing GRCA projects within the project limits. Review of any designs will be crucial to ensure that watercourse remediation recommendations integrate with any ongoing GRCA work.

In fulfillment of this work, GHD is also contacting the Ministry of Northern Development, Mines, Natural Resources and Forestry (NDMNRF), the Ministry of Environment Conservation and Parks (MECP), and the Niagara Peninsula Conservation Authority (NPCA) to ensure our data is complete.

Please let us know if you have any questions or require any further information. We look forward to your response to our request.

image005.png
image006.png

Hello Amy,

I apologize for the delayed response. MECP is continuing to work through a back-log of requests.

The Species at Risk Branch (SARB) has conducted a review of the submission below.

The following additional species are within the vicinity of the site and are not listed below:

American Chestnut	*(Castanea dentata);*
Black Ash	*(Fraxinus nigra);*
Least Bittern	*(Ixobrychus exilis);*
Yellow-breasted Chat	*(Icteria virens).*

No other species at risk occurrences were detected which were not already identified in the submission below.

While this review represents MECP's best currently available information, it is important to note that a lack of information for a site does not mean that SAR or their habitat are not present. There are many areas where the Government of Ontario does not currently have information, especially in areas not previously surveyed. On-site assessments will better verify site conditions, identify and confirm presence of species at risk and/or their habitats.

It is the responsibility of the proponent to ensure that SAR are not killed, harmed, or harassed, and that their habitat is not damaged or destroyed through the proposed activities to be carried out on the site. If the proposed activities can not avoid impacting protected species and their habitats then the proponent will need to apply for a authorization under the Endangered Species Act.

Subject: RE: Background Information Request - Cayuga

Good afternoon,
Just following up on this request from March.
Shamus Snell also provided us with a standard confirmation response the day prior to this one coming through on March 3, 2022. However, we understand he is no longer with the SARB.

Thanks for your help.

Hi Amy,

Species at Risk Branch (SARB) has received your information request for the Brooks Road Landfill Project. It has been assigned to a biologist and placed in the queue for review. Once they complete their review they will contact you directly with the results of the review.

Please note that we continue to receive a large number of requests so your patience is appreciated while we work towards your request.

Regards.

Subject: Background Information Request - Cayuga

Good morning,

GHD would like to request the following background information from the Ministry of Environmental Conservation and Parks (MECP) to assist in the Brooks Road Landfill Project, if available. The project area is located at 160 Brooks Road, Cayuga, Ontario, N0A 1E0 (**Figure 1**).

Through an initial review of Natural Heritage Information Centre (NHIC), Land Information Ontario (LIO), and other databases, we have identified records for the following Species at Risk (SAR) within the vicinity of our study area:

- Insects
  - Monarch
- Birds
  - Bank swallow
  - Barn swallow
  - Bobolink
  - Canada warbler
  - Cerulean warbler
  - Chimney swift
  - Eastern meadowlark
  - Eastern wood-pewee
  - Golden-winged warbler
  - Grasshopper sparrow *pratensis* subspecies
  - Red-headed woodpecker
  - Wood thrush
- Mammals
  - Eastern small-footed myotis
  - Little brown myotis
  - Tri-coloured bat
  - Northern myotis
- Reptiles
  - Blanding's turtle - Great Lakes/St. Lawrence population

- Eastern ribbonsnake - (Great Lakes population)
- Midland painted turtle
- Milksnake
- Northern map turtle
- Snapping turtle

– Vascular Plants
  - Butternut
  - Eastern flowering dogwood

We are seeking any additional information regarding SAR data, and any other data you feel is valuable for this assessment.

In fulfillment of this work, GHD is also contacting the Ministry of Northern Development, Mines, Natural Resources and Forestry (NDMNRF), the Grand River Conservation Authority (GRCA), and the Niagara Peninsula Conservation Authority (NPCA) to ensure our data is complete.

Please let us know if you have any questions or require any further information. We look forward to your response to our request.

Figure 1 Brooks Road Landfill (160 Brooks Road, Cayuga, Ontario, N0A 1E0)

Thanks in advance.

Appendix B

Natural Environment Photographic Log

Photo 1 - View from within the CVI_1 present on the east side of the Local Study Area. This photo was taken looking west on June 10, 2022 at the location of BBS 3.

Photo 2 - View to the AG fields directly west of Brooks Road. Planted corn was observed within this field. This photo was taken between the locations of AMP 1 and 6 facing south on July 10, 2022.

Natural Environment Photographic Log

Photo 3 - The location can condition where the SM1 meter was deployed in the North Lands. The setup is circled in red.

Photo 4 - The MAMM3 vegetation community that is present in the northwest portion of the North Lands. This photo was taken looking west on July 10, 2022

Natural Environment Photographic Log

Photo 5 - Location from within the MAMM2-5 community in the North Lands. A small open aquatic area was observed within this area which was previously mapped as MASM1-8. This photo was taken looking southeast on July 10, 2022

Photo 6 - View of the interface of one MAMM2-5 with the THDM2-4 communities int the North Lands. This photo was taken looking east on July 10, 2022.

Natural Environment Photographic Log

Photo 7 - View of the MASO3 vegetation community present to the east of the Local Study Area. This photo was taken looking east on July 10, 2022

Photo 8 - The FODM9 vegetation community that is present in the east portion of the Local Study Area that abuts the chain link fence (pictured on the left). This photo was taken looking north on July 10, 2022.

Notes

Co-efficient of Conservatism: This value, ranging from 0 (low) to 10 (high), is based on a species tolerance of disturbance and fidelity to a specific habitat integrity.

Weediness Index: This value, ranging from -1 (low) to -3 (high) quantifies the potential invasiveness of non-native plants. In combination with the percentage of non-native plants, it can be used as an indicator of disturbance.

Wetness Index: This value, ranging from -5 (obligate wetland) to 5 (upland) provides the probability of a species occurring in wetland or upland habitats.

S-Ranks-

S1: Critically Imperiled - Critically imperiled in the nation or state/province because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province.

S2: Imperiled - Imperiled in the nation or state/province because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or state/province.

S3: Vulnerable - Vulnerable in the nation or state/province due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.

S4: Apparently Secure - Uncommon but not rare; some cause for long-term concern due to declines or other factors.

S5: Secure - Common, widespread, and abundant in the nation or state/province.

SH: Possibly Extirpated (Historical)—Species or community occurred historically in the nation or state/province, and there is some possibility that it may be rediscovered. Its presence may not have been verified in the past 20-40 years. A species or community could become NH or SH without such a 20-40 year delay if the only known occurrences in a nation or state/province were destroyed or if it had been extensively and unsuccessfully looked for. The NH or SH rank is reserved for species or communities for which some effort has been made to relocate occurrences, rather than simply using this status for all elements not known from verified extant occurrences.

SR: Reported in Ontario, but without persuasive documentation.

SX: Presumed Extirpated—Species or community is believed to be extirpated from the nation or state/province. Not located despite intensive searches of historical sites and other appropriate habitat, and virtually no likelihood that it will be rediscovered.

SE: Exotic; not believed to be a native component of Ontario's flora. Numerical rankings after SE follow designations described above for native species.

SNA: Unranked — Status not assigned.

SU: Unranked — Nation or state/province conservation status not yet assessed.

ESA Status

Endangered Species Act (ESA), 2007. Extirpated - EXP, Endangered - END, Threatened - THR, Special Concern - SC

SARA Status

Species at Risk Act (SARA), 2002. Extirpated - EXP, Endangered - END, Threatened - THR, Special Concern - SC

Notes

Distance: A: Within 50 metres (m) of the survey point; B: 50 - 100 m of the survey point; C: Greater than 100 m of the survey point.

Call level: 1: Calls not simultaneous, number of individuals can be accurately counted; 2: Some calls simultaneous, number of individuals can be reliably estimated; 3: Full chorus, calls continuous and overlapping, number of individuals cannot be reliably estimated.

Abundance: Numbers in parentheses indicate estimated abundance of species; FC: full chorus (cannot be estimated).

* One group observed on each side of the survey area (i.e., two groups of that distance/call level/abundance within survey area).

Weather Conditions

The initial survey was conducted on April 12, 2022; weather conditions were 7.6 - 10˚C, calm (Beaufort wind scale [BWS] = 0) with scattered cloud cover. There was no precipitation during the surveys, but some haze during the surveys for Stations 1, 5, and 6.
The second survey was conducted on May 11, 2022; weather conditions were 15 - 18˚C, clear with no precipitation. Stations 2, 3, and 4 were calm (BWS = 0), with light air (BWS = 1) for Stations 1, 5, and 6.
The third and final survey was conducted on June 15, 2022; weather conditions were 22 - 23.8˚C, clear and humid, with no precipitation. Station 3 and 4 had light air (BWS = 1), reducing to calm (BWS = 0) for Station 2. A gentle breeze (BWS = 3) picked up for Station 5, reducing to a light breeze (BWS = 2) for Station 1, and light air (BWS = 1) for Station 6.

Notes

Distance: A: Within 50 metres (m) of the survey point; B: 50 - 100 m of the survey point; C: Greater than 100 m of the survey point.

Call level: 1: Calls not simultaneous, number of individuals can be accurately counted; 2: Some calls simultaneous, number of individuals can be reliably estimated; 3: Full chorus, calls continuous and overlapping, number of individuals cannot be reliably estimated.

Abundance: Numbers in parentheses indicate estimated abundance of species; FC: full chorus (cannot be estimated).

* One group observed on each side of the survey area (i.e., two groups of that distance/call level/abundance within survey area).

Weather Conditions

The initial survey was conducted on March 25, 2021; weather conditions were 13.5 – 14˚C, calm (Beaufort wind scale [BWS] = 0) with 100% cloud cover. There was no precipitation while surveying Station 1, and a light rain falling during the Station 2 survey. The temperatures observed during the first survey were uncharacteristically warm for early in the season.
The second survey was conducted on April 13, 2021; weather conditions were 7.7 – 9.8˚C, calm (BWS = 0) and clear, with no precipitation.
The third and final survey was conducted on June 28, 2021; weather conditions were 22 – 23˚C with no precipitation. Scattered clouds and a light breeze (BWS = 2) were present while surveying Station 1, changing to clear and still (BWS = 0) for Station 2.

Appendix D-3
2020 Calling Amphibian Surveys
Natural Environment Assessment Report
Brooks Road Landfill

Species	Station 1 (AMP1) North Lands		Station 2 (AMP2) East Lands	
	May 28, 2020	June 29, 2020	May 28, 2020	June 29, 2020
American bullfrog (*Lithobates catesbeianus*)		C-1 (2)		C-2 (3)
Gray treefrog (*Hyla versicolor*)	B-1 (1) B-2 (5)		A-3 (FC)	
Green frog (*Lithobates clamitans*)		A-1 (2) B-1 (1) B-1 (1) C-3 (FC)		C-2 (5)

Notes

Distance: A: Within 50 metres (m) of the survey point; B: 50 - 100 m of the survey point; C: Greater than 100 m of the survey point.

Call level: 1: Calls not simultaneous, number of individuals can be accurately counted; 2: Some calls simultaneous, number of individuals can be reliably estimated; 3: Full chorus, calls continuous and overlapping, number of individuals cannot be reliably estimated.

Abundance: Numbers in parentheses indicate estimated abundance of species; FC: full chorus (cannot be estimated).

Due to uncertainty during the early COVID-19 pandemic response, only two of the recommended three amphibian calling surveys were conducted in 2020. In addition to the species listed, American toad (*Anaxyrus americanus*) was heard prior to the Station 1 survey in May, near the northwest extent of the Site.

Weather Conditions

The initial survey was conducted on May 28, 2020; weather conditions were 19˚C, with 10% cloud cover, and no precipitation. A light breeze (Beaufort wind scale [BWS] = 2) was observed during the Station 1 survey, which reduced to calm (BWS = 0) for the Station 2 survey.
The second and final survey was conducted on June 29, 2020; weather conditions were 20.4 – 21.1˚C, calm (BWS = 0) with clear skies and no precipitation.

Appendix E-1
Breeding Bird Survey Results
Natural Environment Assessment Report
Brooks Road Landfill

Notes
BBS 5 was not surveyed due to it's location within private property.
S-Ranks-
S1: Critically Imperiled - Critically imperiled in the nation or state/province because of extreme rarity (often 5 or fewer occurrences) or because of some factor(s) such as very steep declines making it especially vulnerable to extirpation from the state/province.
S2: Imperiled - Imperiled in the nation or state/province because of rarity due to very restricted range, very few populations (often 20 or fewer), steep declines, or other factors making it very vulnerable to extirpation from the nation or
S3: Vulnerable - Vulnerable in the nation or state/province due to a restricted range, relatively few populations (often 80 or fewer), recent and widespread declines, or other factors making it vulnerable to extirpation.
S4: Apparently Secure - Uncommon but not rare; some cause for long-term concern due to declines or other factors.
S5: Secure - Common, widespread, and abundant in the nation or state/province.
SH: Possibly Extirpated (Historical)—Species or community occurred historically in the nation or state/province, and there is some possibility that it may be rediscovered. Its presence may not have been verified in the past 20-40 years. A species or community could become NH or SH without such a 20-40 year delay if the only known occurrences in a nation or state/province were destroyed or if it had been extensively and unsuccessfully looked for. The NH or SH rank is reserved for species or communities for which some effort has been made to relocate occurrences, rather than simply using this status for all elements not known from verified extant occurrences.
SR: Reported in Ontario, but without persuasive documentation.
SX: Presumed Extirpated—Species or community is believed to be extirpated from the nation or state/province. Not located despite intensive searches of historical sites and other appropriate habitat, and virtually no likelihood that it
SE: Exotic; not believed to be a native component of Ontario's flora. Numerical rankings after SE follow designations described above for native species.
SNA: Unranked — Status not assigned.
SU: Unranked — Nation or state/province conservation status not yet assessed.
ESA Status
Endangered Species Act (ESA), 2007. Extirpated - EXP, Endangered - END, Threatened - THR, Special Concern - SC
SARA Status
Species at Risk Act (SARA), 2002. Extirpated - EXP, Endangered - END, Threatened - THR, Special Concern - SC
All species listed were identified by song/vocalizations unless otherwise noted
O: Species observed ('X': observed during breeding season but no evidence of breeding)
P: Possible breeding ('S': singing male present; 'H': species observed in breeding season in suitable nesting habitat)
PR: Probable breeding ('P': Pair observed; 'T': Permanent territory presumed through territorial behaviour on both visits; 'D': Courtship or display; 'V': visiting probable nest site; 'A': Agitated behaviour or anxiety calls of an adult; 'B': Brood Patch; 'N': Nest-building)
C: Confirmed breeding ('DD': Distraction display; 'NU': Used nest or eggshells found; 'FY': Recently fledged young; 'AE': Adult leaving or entering nest site; 'FS': Adult carrying fecal sac; 'CF': adult carrying food for young; 'NE': Nest with eggs; 'NY': Nest with young)

Appendix F

Species at Risk Screening

Common Name	Scientific Name	SARA[1]	ESA[2]	Habitat Requirements	Likelihood of Occurrence within the Local Study Area
Insects					
Monarch	*Danaus plexippus*	SC	SC	In Ontario, monarch is found throughout the northern and southern regions of the province. This butterfly is found wherever there are milkweed (*Asclepias* spp.) plants for its caterpillars and wildflowers that supply a nectar source for adults. It is often found on abandoned farmland, meadows, open wetlands, prairies and roadsides, but also in city gardens and parks. Important staging areas during migration occur along the north shores of the Great Lakes (COSEWIC 2010).	High likelihood of occurrence. Monarch observed within the Local Study Area. Milkweed is also present within the Local Study Area.
Birds					
Bank swallow	*Riparia riparia*	THR	THR	In Ontario, the bank swallow breeds in a variety of natural and anthropogenic habitats, including lake bluffs, stream and river banks, sand and gravel pits, and roadcuts. Nests are built in a vertical or near-vertical bank. Breeding sites are typically located near open foraging sites such as rivers, lakes, grasslands, agricultural fields, wetlands and riparian woods. Forested areas are generally avoided (Garrison 1999).	Moderate likelihood of occurrence as potentially suitable habitat is present within the Local Study Area.
Barn swallow	*Hirundo rustica*	THR	THR	In Ontario, barn swallow breeds in areas that contain a suitable nesting structure, open areas for foraging, and a body of water. This species nests in human made structures including barns, buildings, sheds, bridges, and culverts. Preferred foraging habitat includes grassy fields, pastures, agricultural cropland, lake and river shorelines, cleared right-of-ways, and wetlands (COSEWIC 2011). Mud nests are fastened to vertical walls or built on a ledge underneath an overhang. Suitable nests from previous years are reused (Brown and Brown 1999).	High likelihood of occurrence. Observed foraging over the Site Study Area during surveys.
Bobolink	*Dolichonyx oryzivorus*	THR	THR	In Ontario, bobolink breeds in grasslands or graminoid dominated hayfields with tall vegetation (Gabhauer 2007). Bobolink prefers grassland habitat with a forb component and a moderate litter layer. They have low tolerance for presence of woody vegetation and are sensitive to frequent mowing within the breeding season. They are most abundant in established, but regularly maintained, hayfields, but also breed in lightly grazed pastures, old or fallow fields, cultural meadows and newly planted hayfields. Their nest is woven from grasses and forbs. It is built on the ground, in dense vegetation, usually under the cover of one or more forbs (Martin and Gavin 1995).	Low likelihood of occurrence within the Local Study Area. Suitable habitat is potentially present within the agricultural areas, however these areas were not surveyed due to restricted access.
Canada warbler	*Cardellina canadensis*	THR	SC	In Ontario, breeding habitat for Canada warbler consists of moist mixed forests with a well-developed shrubby understory. This includes low-lying areas such as cedar and alder swamps, and riparian thickets (McLaren 2007). It is also found in densely vegetated regenerating forest openings.Suitable habitat often contains a developed moss layer and an uneven forest floor. Nests are well concealed on or near the ground in dense shrub or fern cover, often in stumps, fallen logs, overhanging stream banks or mossy hummocks (Reitsma et al. 2010).	High likelihood of occurrence. Observed within the Local Study Area during surveys.
Cerulean warbler	*Setophaga cerulea*	END	THR	In Ontario, breeding habitat of cerulean warbler consists of second-growth or mature deciduous forest with a tall canopy of uneven vertical structure and a sparse understory. This habitat occurs in both wet bottomland forests and upland areas, and often contains large hickory and oak trees. This species may be attracted to gaps or openings in the upper canopy. The cerulean warbler is associated with large forest tracks, but may occur in woodlots as small as 10 ha (COSEWIC 2010). Nests are usually built on a horizontal limb in the mid-story or canopy of a large deciduous tree (Buehler et al. 2013).	Moderate likelihood of occurrence as potentially suitable habitat is present within the Local Study Area.
Chimney swift	*Chaetura pelagica*	THR	THR	In Ontario, chimney swift breeding habitat is varied and includes urban, suburban, rural and wooded sites. They are most commonly associated with towns and cities with large concentrations of chimneys. Preferred nesting sites are dark, sheltered spots with a vertical surface to which the bird can grip. Unused chimneys are the primary nesting and roosting structure, but other anthropogenic structures and large diameter cavity trees are also used (COSEWIC 2007).	Low likelihood of occurrence as suitable habitat is not present within the Local Study Area.

Common Name	Scientific Name	SARA[1]	ESA[2]	Habitat Requirements	Likelihood of Occurrence within the Local Study Area
Eastern meadowlark	*Sturnella magna*	THR	THR	In Ontario, the eastern meadowlark breeds in pastures, hayfields, meadows and old fields. Eastern meadowlark prefers moderately tall grasslands with abundant litter cover, high grass proportion, and a forb component (Hull 2003). They prefer well drained sites or slopes, and sites with different cover layers (Roseberry and Klimstra 1970)	Low likelihood of occurrence within the Local Study Area. Suitable habitat is potentially present within the agricultural areas, however these areas were not surveyed due to restricted access.
Eastern wood-pewee	*Contopus virens*	SC	SC	The eastern wood-pewee inhabits a wide variety of wooded upland and lowland habitats but is most commonly associated with the mid-canopy of forest clearings, and edge habitat in deciduous and mixed forests. It also occurs in anthropogenic habitats that provide an open forested aspect such as parks and suburban neighborhoods. It prefers intermediate-age mature forest stands with little understory vegetation (COSEWIC 2012).	High likelihood of occurrence. Observed within the Local Study Area during surveys.
Golden-winged warbler	*Vermivora chrysoptera*	THR	SC	In Ontario, golden-winged warbler breeds in regenerating scrub habitat with dense ground cover and a patchwork of shrubs, usually surrounded by forest. Their preferred habitat is characteristic of a successional landscape associated with natural or anthropogenic disturbance such as right-of-ways, and field edges or openings resulting from logging or burning. The nest of the golden-winged warbler is built on the ground at the base of a shrub or leafy plant, often at the shaded edge of the forest or at the edge of a forest opening (Confer et al. 2011).	Low likelihood of occurrence as suitable habitat is not present within the Local Study Area.
Grasshopper sparrow *pratensis* subspecies	*Ammodramus savannarum* (*pratensis* subspecies)	SC	SC	In Ontario, grasshopper sparrow is found in medium to large grasslands with low herbaceous cover and few shrubs. It also uses a wide variety of agricultural fields, including cereal crops and pastures. Close-grazed pastures and limestone plains (e.g. Carden and Napanee Plains) support highest density of this bird in the province (COSEWIC 2013).	Low likelihood of occurrence within the Local Study Area. Suitable habitat is potentially present within the agricultural areas, however these areas were not surveyed due to restricted access.
Least bittern	*Ixobrychus exilis*	THR	THR	In Ontario, the least bittern breeds in marshes, usually greater than 5 ha, with emergent vegetation, relatively stable water levels and areas of open water. Preferred habitat has water less than 1 m deep (usually 10 – 50 cm). Nests are built in tall stands of dense emergent or woody vegetation (Woodliffe 2007). Clarity of water is important as siltation, turbidity, or excessive eutrophication hinders foraging efficiency (COSEWIC 2009).	High likelihood of occurrence. Observed in the Local Study Area during 2014 surveys (GHD 2017).
Red-headed woodpecker	*Melanerpes erythrocephalus*	END	END	In Ontario, the red-headed woodpecker breeds in open, deciduous woodlands or woodland edges and are often found in parks, cemeteries, golf courses, orchards and savannahs (Woodliffe 2007). They may also breed in forest clearings or open agricultural areas provided that large trees are available for nesting. They prefer forests with little or no understory vegetation. They are often associated with beech or oak forests, beaver ponds and swamp forests where snags are numerous. Nests are excavated in the trunks of large dead trees (Smith et al. 2000).	Moderate likelihood of occurrence as suitable habitat is present within the Local Study Area.
Wood thrush	*Hylocichla mustelina*	THR	SC	In Ontario, wood thrush breeds in moist, deciduous hardwood or mixed stands that are often previously disturbed, with a dense deciduous undergrowth and with tall trees for singing perches. This species selects nesting sites with the following characteristics: lower elevations with trees less than 16 m in height, a closed canopy cover (>70 %), a high variety of deciduous tree species, moderate subcanopy and shrub density, shade, fairly open forest floor, moist soil, and decaying leaf litter (COSEWIC 2012).	High likelihood of occurrence. Observed within the Local Study Area during surveys.
Yellow-breasted chat	*Icteria virens virens*	END	END	In Ontario, yellow-breasted chat breeds in early successional, shrub-thicket habitats including woodland edges, regenerating old fields, railway and hydro right-of-ways, young coniferous reforestations, and wet thickets bordering wetlands. Tangles of grape (*Vitis* spp.) and raspberry (*Rubus* spp.) vines are features of most breeding sites. There is some evidence that the yellow-breasted chat is an area sensitive species. Nests are located in dense shrubbery near to the ground (COSEWIC 2011).	Moderate likelihood of occurrence as suitable habitat is present within the Local Study Area.

Common Name	Scientific Name	SARA[1]	ESA[2]	Habitat Requirements	Likelihood of Occurrence within the Local Study Area
Mammals					
Eastern small-footed myotis	*Myotis leibii*	—	END	This species is not known to roost within trees, but there is very little known about its roosting habits. The species generally roosts on the ground under rocks, in rock crevices, talus slopes, or rock piles, and occasionally inhabits buildings. Areas near the entrances of caves or abandoned mines may be used for hibernaculum, where the conditions are drafty with low humidity, and may be subfreezing (Humphrey 2017).	Moderate likelihood of occurrence as potentially suitable habitat is present within the Local Study Area.
Little brown myotis	*Myotis lucifugus*	END	END	In Ontario, this species range is extensive and covers much of the province. It will roost in both natural and man-made structures. They require a number of large dead trees, in specific stages of decay and that project above the canopy in relatively open areas (Lacki, 2007). May form nursery colonies in the attics of buildings within 1 km of water. Caves or abandoned mines may be used for hibernaculum, but high humidity and stable above freezing temperatures are required.	High likelihood of occurrence as suitable habitat is present within the Local Study Area.
Tri-colored bat	*Perimyotis subflavus*	END	END	In Ontario, tri-colored bat may roost in foliage, in clumps of old leaves, hanging moss or squirrel nests. They are occasionally found in buildings although there are no records of this in Canada (Poissant et al, 2010). They typically feed over aquatic areas with an affinity to large-bodied water and will likely roost in close proximity to these. Hibernation sites are found deep within caves or mines in areas of relatively warm temperatures. These bats have strong roost fidelity to their winter hibernation sites and may choose the exact same spot in a cave or mine from year to year.	High likelihood of occurrence as suitable habitat is present within the Local Study Area.
Northern myotis	*Myotis septentrionalis*	END	END	In Ontario, this species range is extensive and covers much of the province. It will usually roost in hollows, crevices, and under loose bark of mature trees. Roosts may be established in the main trunk or a large branch of either living or dead trees. Caves or abandoned mines may be used for hibernaculum, but high humidity and stable above freezing temperatures are required (COSSARO 2012).	High likelihood of occurrence as suitable habitat is present within the Local Study Area.
Reptiles					
Blanding's turtle - Great Lakes/St. Lawrence population	*Emydoidea blandingii*	THR	THR	In Ontario, Blanding's turtle will use a range of aquatic habitats, but favor those with shallow, standing or slow-moving water, rich nutrient levels, organic substrates and abundant aquatic vegetation. They will use rivers, but prefer slow-moving currents and are likely only transients in this type of habitat. This species is known to travel great distances over land in the spring in order to reach nesting sites, which can include dry conifer or mixed forests, partially vegetated fields, and roadsides. Suitable nesting substrates include organic soils, sands, gravel and cobble. They hibernate underwater and infrequently under debris close to water bodies (COSEWIC 2005).	High likelihood of occurrence. Observed in the Local Study Area during 2014 surveys (GHD 2017).
Eastern ribbonsnake - (Great Lakes population)	*Thamnophis sauritus*	SC	SC	In Ontario, eastern ribbonsnake is semi-aquatic, and is rarely found far from shallow ponds, marshes, bogs, streams or swamps bordered by dense vegetation. They prefer sunny locations and bask in low shrub branches. Hibernation occurs in mammal burrows, rock fissures or even ant mounds (COSEWIC 2012).	High likelihood of occurrence as suitable habitat is present within the Local Study Area.
Midland painted turtle	*Chrysemys picta marginata*	SC	Under consideration	Painted turtles occupy slow moving, relatively shallow and well-vegetated wetlands (e.g., swamps, marshes, ponds, fens, bogs, and oxbows) and water bodies (e.g., lakes, rivers, creeks, and streams) with abundant basking sites and organic substrate. The species is semi-tolerant of human-altered landscapes and may occasionally be found occupying urban ponds and lands subject to anthropogenic disturbance (e.g., farm ponds, impoundments, water treatment facilities) (COSEWIC 2018).	High likelihood of occurrence as suitable habitat is present within the Local Study Area.
Milksnake	*Lampropeltis triangulum*	SC	NAR	In Ontario, milksnake uses a wide range of habitats including prairies, pastures, hayfields, wetlands and various forest types, and is well-known in rural areas where it frequents older buildings. Proximity to water and cover enhances habitat suitability. Hibernation takes place in mammal burrows, hollow logs, gravel or soil banks, and old foundations (COSEWIC 2014).	High likelihood of occurrence. Observed within the Site Study Area during surveys.

Common Name	Scientific Name	SARA[1]	ESA[2]	Habitat Requirements	Likelihood of Occurrence within the Local Study Area
Northern map turtle	Graptemys geographica	SC	SC	In Ontario, the northern map turtle prefers large waterbodies with slow-moving currents, soft substrates, and abundant aquatic vegetation. Ideal stretches of shoreline contain suitable basking sites, such as rocks and logs. Along Lakes Erie and Ontario, this species occurs in marsh habitat and undeveloped shorelines. It is also found in small to large rivers with slow to moderate flow. Hibernation takes place in soft substrates under deep water (COSEWIC 2012).	High likelihood of occurrence as suitable habitat is present within the Local Study Area.
Snapping turtle	*Chelydra serpentina*	SC	SC	In Ontario, snapping turtle utilizes a wide range of waterbodies, but shows preference for areas with shallow, slow-moving water, soft substrates and dense aquatic vegetation. Hibernation takes place in soft substrates under water. Nesting sites consist of sand or gravel banks along waterways or roadways (COSEWIC 2008).	High likelihood of occurrence. Observed in the Local Study Area during 2013 surveys (GHD 2017).
Vascular Plants					
American chestnut	*Castanea dentata*	END	END	In Ontario, American chestnut occurs in mixed or deciduous forests in the Carolinian zone (Farrar 1995). It is often found in communities with dense canopy cover and often associated with oak and maple. This tree grows primarily on acidic, sand or gravel soils (Boland et al. 2012).	Moderate likelihood of occurrence as suitable habitat is present within the Local Study Area.
Black ash	*Fraxinus nigra*	-	END	Black Ash is predominantly a wetland species of swamps, floodplains and fens. It has an intermediate light requirement and a tendency toward greater abundance in more alkaline sites. Most sites in which it is dominant are flood prone, where its high tolerance of seasonal flooding appears to offer a competitive advantage. Black Ash also occurs widely in moist upland forests, but generally at lower densities than in wet areas (COSEWIC 2018).	Moderate likelihood of occurrence as suitable habitat is present within the Local Study Area. Observed in the Local Study Area during 2016 surveys (GHD 2017).
Butternut	*Juglans cinerea*	END	END	In Ontario, butternut is found along stream banks, on wooded valley slopes, and in deciduous and mixed forests. It is commonly associated with beech, maple, oak and hickory (Voss and Reznicek 2012). Butternut prefers moist, fertile, well-drained soils, but can also be found in rocky limestone soils. This species is shade intolerant (Farrar 1995).	Moderate likelihood of occurrence as suitable habitat is present within the Local Study Area.
Eastern flowering dogwood	*Cornus florida*	END	END	In Ontario, eastern flowering dogwood grows in the understory of dry to rich deciduous forests, especially on hillsides and riverbanks. It prefers sandy acidic soils but occasionally is found in loams, clays and organic soils (Waldron 2003). This species is restricted to the Carolinian zone of southern Ontario.	Moderate likelihood of occurrence as suitable habitat is present within the Local Study Area.
Notes					
[1] *Species at Risk Act* (SARA), 2002. Schedule 1; Part 1 (Extirpated), Part 2 (Endangered), Part 3 (Threatened), Part 4 (Special Concern)

Appendix G

Checklist for Cultural and Built Heritage

Ontario

Ministry of Tourism, Culture and Sport

Programs & Services Branch
401 Bay Street, Suite 1700
Toronto ON M7A 0A7

Criteria for Evaluating Archaeological Potential

A Checklist for the Non-Specialist

The **purpose of the checklist** is to determine:

- if a property(ies) or project area may contain archaeological resources i.e., have archaeological potential
- it includes all areas that may be impacted by project activities, including – but not limited to:
  - the main project area
  - temporary storage
  - staging and working areas
  - temporary roads and detours

Processes covered under this checklist, such as:

- *Planning Act*
- *Environmental Assessment Act*
- *Aggregates Resources Act*
- *Ontario Heritage Act* – Standards and Guidelines for Conservation of Provincial Heritage Properties

Archaeological assessment

If you are not sure how to answer one or more of the questions on the checklist, you may want to hire a licensed consultant archaeologist (see page 4 for definitions) to undertake an archaeological assessment.

The assessment will help you:

- identify, evaluate and protect archaeological resources on your property or project area
- reduce potential delays and risks to your project

Note: By law, archaeological assessments **must** be done by a licensed consultant archaeologist. Only a licensed archaeologist can assess – or alter – an archaeological site.

What to do if you:

- **find an archaeological resource**

  If you find something you think may be of archaeological value during project work, you must – by law – stop all activities immediately and contact a licensed consultant archaeologist

  The archaeologist will carry out the fieldwork in compliance with the *Ontario Heritage Act* [s.48(1)].

- **unearth a burial site**

  If you find a burial site containing human remains, you must immediately notify the appropriate authorities (i.e., police, coroner's office, and/or Registrar of Cemeteries) and comply with the *Funeral, Burial and Cremation Services Act*.

Other checklists

Please use a separate checklist for your project, if:

- you are seeking a Renewable Energy Approval under Ontario Regulation 359/09 – separate checklist
- your Parent Class EA document has an approved screening criteria (as referenced in Question 1)

Please refer to the Instructions pages when completing this form.

Project or Property Name

Brooks Road Landfill Site

Project or Property Location (upper and lower or single tier municipality)

160 Brooks Road, Haldimand, ON

Brooks Road Environmental

Proponent Contact Information

Richard Weldon, 416-928-4810

Screening Questions

	Yes	No
1. Is there a pre-approved screening checklist, methodology or process in place?	☐	☑

If Yes, please follow the pre-approved screening checklist, methodology or process.

If No, continue to Question 2.

	Yes	No
2. Has an archaeological assessment been prepared for the property (or project area) and been accepted by MTCS?	☐	☑

If Yes, do **not** complete the rest of the checklist. You are expected to follow the recommendations in the archaeological assessment report(s).

The proponent, property owner and/or approval authority will:

- summarize the previous assessment
- add this checklist to the project file, with the appropriate documents that demonstrate an archaeological assessment was undertaken e.g., MTCS letter stating acceptance of archaeological assessment report

The summary and appropriate documentation may be:

- submitted as part of a report requirement e.g., environmental assessment document
- maintained by the property owner, proponent or approval authority

If No, continue to Question 3.

	Yes	No
3. Are there known archaeological sites on or within 300 metres of the property (or the project area)?	☐	☑
4. Is there Aboriginal or local knowledge of archaeological sites on or within 300 metres of the property (or project area)?	☐	☑
5. Is there Aboriginal knowledge or historically documented evidence of past Aboriginal use on or within 300 metres of the property (or project area)?	☐	☑
6. Is there a known burial site or cemetery on the property or adjacent to the property (or project area)?	☐	☑
7. Has the property (or project area) been recognized for its cultural heritage value?	☐	☑

If Yes to any of the above questions (3 to 7), do **not** complete the checklist. Instead, you need to hire a licensed consultant archaeologist to undertake an archaeological assessment of your property or project area.

If No, continue to question 8.

	Yes	No
8. Has the entire property (or project area) been subjected to recent, extensive and intensive disturbance?	☑	☐

If Yes to the preceding question, do **not** complete the checklist. Instead, please keep and maintain a summary of documentation that provides evidence of the recent disturbance.

An archaeological assessment is not required.

If No, continue to question 9.

	Yes	No
9. Are there present or past water sources within 300 metres of the property (or project area)?	☐	☐

If Yes, an archaeological assessment is required.

If No, continue to question 10.

	Yes	No
10. Is there evidence of two or more of the following on the property (or project area)?	☐	☐

- elevated topography
- pockets of well-drained sandy soil
- distinctive land formations
- resource extraction areas
- early historic settlement
- early historic transportation routes

If Yes, an archaeological assessment is required.

If No, there is low potential for archaeological resources at the property (or project area).

The proponent, property owner and/or approval authority will:

- summarize the conclusion
- add this checklist with the appropriate documentation to the project file

The summary and appropriate documentation may be:

- submitted as part of a report requirement e.g., under the *Environmental Assessment Act, Planning Act* processes
- maintained by the property owner, proponent or approval authority

Instructions

Please have the following available, when requesting information related to the screening questions below:

- a clear map showing the location and boundary of the property or project area
  - large scale and small scale showing nearby township names for context purposes
- the municipal addresses of all properties within the project area
- the lot(s), concession(s), and parcel number(s) of all properties within a project area

In this context, the following definitions apply:

- **consultant archaeologist** means, as defined in Ontario regulation as an archaeologist who enters into an agreement with a client to carry out or supervise archaeological fieldwork on behalf of the client, produce reports for or on behalf of the client and provide technical advice to the client. In Ontario, these people also are required to hold a valid professional archaeological licence issued by the Ministry of Tourism, Culture and Sport.
- **proponent** means a person, agency, group or organization that carries out or proposes to carry out an undertaking or is the owner or person having charge, management or control of an undertaking.

1. Is there a pre-approved screening checklist, methodology or process in place?

An existing checklist, methodology or process may be already in place for identifying archaeological potential, including:

- one prepared and adopted by the municipality e.g., archaeological management plan
- an environmental assessment process e.g., screening checklist for municipal bridges
- one that is approved by the Ministry of Tourism, Culture and Sport under the Ontario government's Standards & Guidelines for Conservation of Provincial Heritage Properties [s. B.2.]

2. Has an archaeological assessment been prepared for the property (or project area) and been accepted by MTCS?

Respond 'yes' to this question, if all of the following are true:

- an archaeological assessment report has been prepared and is in compliance with MTCS requirements
  - a letter has been sent by MTCS to the licensed archaeologist confirming that MTCS has added the report to the Ontario Public Register of Archaeological Reports (Register)
- the report states that there are no concerns regarding impacts to archaeological sites

Otherwise, if an assessment has been completed and deemed compliant by the MTCS, and the ministry recommends further archaeological assessment work, this work will need to be completed.

For more information about archaeological assessments, contact:

- approval authority
- proponent
- consultant archaeologist
- Ministry of Tourism, Culture and Sport at archaeology@ontario.ca

3. Are there known archaeological sites on or within 300 metres of the property (or project area)?

MTCS maintains a database of archaeological sites reported to the ministry.

For more information, contact MTCS Archaeological Data Coordinator at archaeology@ontario.ca.

4. Is there Aboriginal or local knowledge of archaeological sites on or within 300 metres of the property?

Check with:

- Aboriginal communities in your area
- local municipal staff

They may have information about archaeological sites that are not included in MTCS' database.

Other sources of local knowledge may include:

- property owner
- local heritage organizations and historical societies
- local museums
- municipal heritage committee
- published local histories

5. Is there Aboriginal knowledge or historically documented evidence of past Aboriginal use on or within 300 metres of the property (or property area)?

Check with:

- Aboriginal communities in your area
- local municipal staff

Other sources of local knowledge may include:

- property owner
- local heritage organizations and historical societies
- local museums
- municipal heritage committee
- published local histories

6. Is there a known burial site or cemetery on the property or adjacent to the property (or project area)?

For more information on known cemeteries and/or burial sites, see:

- Cemeteries Regulation Unit, Ontario Ministry of Consumer Services – for database of registered cemeteries
- Ontario Genealogical Society (OGS) – to locate records of Ontario cemeteries, both currently and no longer in existence; cairns, family plots and burial registers
- Canadian County Atlas Digital Project – to locate early cemeteries

In this context, 'adjacent' means 'contiguous', or as otherwise defined in a municipal official plan.

7. Has the property (or project area) been recognized for its cultural heritage value?

There is a strong chance there may be archaeological resources on your property (or immediate area) if it has been listed, designated or otherwise identified as being of cultural heritage value by:

- your municipality
- Ontario government
- Canadian government

This includes a property that is:

- designated under *Ontario Heritage Act* (the OHA), including:
  - individual designation (Part IV)
  - part of a heritage conservation district (Part V)
  - an archaeological site (Part VI)
- subject to:
  - an agreement, covenant or easement entered into under the OHA (Parts II or IV)
  - a notice of intention to designate (Part IV)
  - a heritage conservation district study area by-law (Part V) of the OHA
- listed on:
  - a municipal register or inventory of heritage properties
  - Ontario government's list of provincial heritage properties
  - Federal government's list of federal heritage buildings
- part of a:
  - National Historic Site
  - UNESCO World Heritage Site
- designated under:
  - *Heritage Railway Station Protection Act*
  - *Heritage Lighthouse Protection Act*
- subject of a municipal, provincial or federal commemorative or interpretive plaque.

To determine if your property or project area is covered by any of the above, see:

- Part A of the MTCS Criteria for Evaluating Potential for Built Heritage and Cultural Heritage Landscapes

Part VI – Archaeological Sites

Includes five sites designated by the Minister under Regulation 875 of the Revised Regulation of Ontario, 1990 (Archaeological Sites) and 3 marine archaeological sites prescribed under Ontario Regulation 11/06.

For more information, check Regulation 875 and Ontario Regulation 11/06.

8. Has the entire property (or project area) been subjected to recent extensive and intensive ground disturbance?

Recent: after-1960

Extensive: over all or most of the area

Intensive: thorough or complete disturbance

Examples of ground disturbance include:

- quarrying
- major landscaping – involving grading below topsoil
- building footprints and associated construction area
  - where the building has deep foundations or a basement
- infrastructure development such as:
  - sewer lines
  - gas lines
  - underground hydro lines
  - roads
  - any associated trenches, ditches, interchanges. **Note**: this applies only to the excavated part of the right-of-way; the remainder of the right-of-way or corridor may not have been impacted.

A ground disturbance does **not** include:

- agricultural cultivation
- gardening
- landscaping

Site visits

You can typically get this information from a site visit. In that case, please document your visit in the process (e.g., report) with:

- photographs
- maps
- detailed descriptions

If a disturbance isn't clear from a site visit or other research, you need to hire a licensed consultant archaeologist to undertake an archaeological assessment.

9. Are there present or past water bodies within 300 metres of the property (or project area)?

Water bodies are associated with past human occupations and use of the land. About 80-90% of archaeological sites are found within 300 metres of water bodies.

Present

- Water bodies:
  - primary - lakes, rivers, streams, creeks
  - secondary - springs, marshes, swamps and intermittent streams and creeks
- accessible or inaccessible shoreline, for example:
  - high bluffs
  - swamps
  - marsh fields by the edge of a lake
  - sandbars stretching into marsh

Water bodies not included:

- man-made water bodies, for example:
  - temporary channels for surface drainage
  - rock chutes and spillways
  - temporarily ponded areas that are normally farmed
  - dugout ponds
- artificial bodies of water intended for storage, treatment or recirculation of:
  - runoff from farm animal yards
  - manure storage facilities
  - sites and outdoor confinement areas

Past

Features indicating past water bodies:

- raised sand or gravel beach ridges – can indicate glacial lake shorelines
- clear dip in the land – can indicate an old river or stream
- shorelines of drained lakes or marshes
- cobble beaches

You can get information about water bodies through:

- a site visit
- aerial photographs
- 1:10,000 scale Ontario Base Maps - or equally detailed and scaled maps.

10. Is there evidence of two or more of the following on the property (or project area)?

- elevated topography
- pockets of well-drained sandy soil
- distinctive land formations
- resource extraction areas
- early historic settlement
- early historic transportation routes

- **Elevated topography**

  Higher ground and elevated positions - surrounded by low or level topography - often indicate past settlement and land use.

  Features such as eskers, drumlins, sizeable knolls, plateaus next to lowlands, or other such features are a strong indication of archaeological potential.

  Find out if your property or project area has elevated topography, through:

  - site inspection
  - aerial photographs
  - topographical maps

- **Pockets of well-drained sandy soil, especially within areas of heavy soil or rocky ground**

  Sandy, well-drained soil - in areas characterized by heavy soil or rocky ground - may indicate archaeological potential

  Find out if your property or project area has sandy soil through:

  - site inspection
  - soil survey reports

- **Distinctive land formations**

  Distinctive land formations include – but are not limited to:

  - waterfalls
  - rock outcrops
  - rock faces
  - caverns
  - mounds, etc.

  They were often important to past inhabitants as special or sacred places. The following sites may be present – or close to – these formations:

  - burials
  - structures
  - offerings
  - rock paintings or carvings

  Find out if your property or project areas has a distinctive land formation through:

  - a site visit
  - aerial photographs
  - 1:10,000 scale Ontario Base Maps - or equally detailed and scaled maps.

- **Resource extraction areas**

  The following resources were collected in these extraction areas:

  - food or medicinal plants e.g., migratory routes, spawning areas, prairie
  - scarce raw materials e.g., quartz, copper, ochre or outcrops of chert
  - resources associated with early historic industry e.g., fur trade, logging, prospecting, mining

  Aboriginal communities may hold traditional knowledge about their past use or resources in the area.

- **Early historic settlement**

  Early Euro-Canadian settlement include – but are not limited to:

  - early military or pioneer settlement e.g., pioneer homesteads, isolated cabins, farmstead complexes
  - early wharf or dock complexes
  - pioneers churches and early cemeteries

  For more information, see below – under the early historic transportation routes.

- **Early historic transportation routes** - such as trails, passes, roads, railways, portage routes, canals.

  For more information, see:

  - historical maps and/or historical atlases
    - for information on early settlement patterns such as trails (including Aboriginal trails), monuments, structures, fences, mills, historic roads, rail corridors, canals, etc.
    - Archives of Ontario holds a large collection of historical maps and historical atlases
    - digital versions of historic atlases are available on the Canadian County Atlas Digital Project
  - commemorative markers or plaques such as local, provincial or federal agencies
  - municipal heritage committee or other local heritage organizations
    - for information on early historic settlements or landscape features (e.g., fences, mill races, etc.)
    - for information on commemorative markers or plaques

Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes

A Checklist for the Non-Specialist

The **purpose of the checklist** is to determine:

- if a property(ies) or project area:
    - is a recognized heritage property
    - may be of cultural heritage value
- it includes all areas that may be impacted by project activities, including – but not limited to:
    - the main project area
    - temporary storage
    - staging and working areas
    - temporary roads and detours

Processes covered under this checklist, such as:

- *Planning Act*
- *Environmental Assessment Act*
- *Aggregates Resources Act*
- *Ontario Heritage Act* – Standards and Guidelines for Conservation of Provincial Heritage Properties

Cultural Heritage Evaluation Report (CHER)

If you are not sure how to answer one or more of the questions on the checklist, you may want to hire a qualified person(s) (see page 5 for definitions) to undertake a cultural heritage evaluation report (CHER).

The CHER will help you:

- identify, evaluate and protect cultural heritage resources on your property or project area
- reduce potential delays and risks to a project

Other checklists

Please use a separate checklist for your project, if:

- you are seeking a Renewable Energy Approval under Ontario Regulation 359/09 – separate checklist
- your Parent Class EA document has an approved screening criteria (as referenced in Question 1)

Please refer to the Instructions pages for more detailed information and when completing this form.

Screening Questions

	Yes	No
1. Is there a pre-approved screening checklist, methodology or process in place?	☐	☑

If Yes, please follow the pre-approved screening checklist, methodology or process.

If No, continue to Question 2.

Part A: Screening for known (or recognized) Cultural Heritage Value

	Yes	No
2. Has the property (or project area) been evaluated before and found **not** to be of cultural heritage value?	☐	☑

If Yes, do **not** complete the rest of the checklist.

The proponent, property owner and/or approval authority will:

- summarize the previous evaluation and
- add this checklist to the project file, with the appropriate documents that demonstrate a cultural heritage evaluation was undertaken

The summary and appropriate documentation may be:

- submitted as part of a report requirement
- maintained by the property owner, proponent or approval authority

If No, continue to Question 3.

	Yes	No
3. Is the property (or project area):		
a. identified, designated or otherwise protected under the *Ontario Heritage Act* as being of cultural heritage value?	☐	☑
b. a National Historic Site (or part of)?	☐	☑
c. designated under the *Heritage Railway Stations Protection Act*?	☐	☑
d. designated under the *Heritage Lighthouse Protection Act*?	☐	☑
e. identified as a Federal Heritage Building by the Federal Heritage Buildings Review Office (FHBRO)?	☐	☑
f. located within a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Site?	☐	☑

If Yes to any of the above questions, you need to hire a qualified person(s) to undertake:

- a Cultural Heritage Evaluation Report, if a Statement of Cultural Heritage Value has not previously been prepared or the statement needs to be updated

If a Statement of Cultural Heritage Value has been prepared previously and if alterations or development are proposed, you need to hire a qualified person(s) to undertake:

- a Heritage Impact Assessment (HIA) – the report will assess and avoid, eliminate or mitigate impacts

If No, continue to Question 4.

Part B: Screening for Potential Cultural Heritage Value

	Yes	No
4. Does the property (or project area) contain a parcel of land that:		
a. is the subject of a municipal, provincial or federal commemorative or interpretive plaque?	☐	☑
b. has or is adjacent to a known burial site and/or cemetery?	☐	☑
c. is in a Canadian Heritage River watershed?	☑	☐
d. contains buildings or structures that are 40 or more years old?	☐	☑

Part C: Other Considerations

	Yes	No
5. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area):		
a. is considered a landmark in the local community or contains any structures or sites that are important in defining the character of the area?	☐	☑
b. has a special association with a community, person or historical event?	☐	☑
c. contains or is part of a cultural heritage landscape?	☐	☑

If Yes to one or more of the above questions (Part B and C), there is potential for cultural heritage resources on the property or within the project area.

You need to hire a qualified person(s) to undertake:

- a Cultural Heritage Evaluation Report (CHER)

If the property is determined to be of cultural heritage value and alterations or development is proposed, you need to hire a qualified person(s) to undertake:

- a Heritage Impact Assessment (HIA) – the report will assess and avoid, eliminate or mitigate impacts

If No to all of the above questions, there is low potential for built heritage or cultural heritage landscape on the property.

The proponent, property owner and/or approval authority will:

- summarize the conclusion
- add this checklist with the appropriate documentation to the project file

The summary and appropriate documentation may be:

- submitted as part of a report requirement e.g. under the *Environmental Assessment Act, Planning Act* processes
- maintained by the property owner, proponent or approval authority

Instructions

Please have the following available, when requesting information related to the screening questions below:

- a clear map showing the location and boundary of the property or project area
  - large scale and small scale showing nearby township names for context purposes
- the municipal addresses of all properties within the project area
- the lot(s), concession(s), and parcel number(s) of all properties within a project area

For more information, see the Ministry of Tourism, Culture and Sport's Ontario Heritage Toolkit or Standards and Guidelines for Conservation of Provincial Heritage Properties.

In this context, the following definitions apply:

- **qualified person(s)** means individuals – professional engineers, architects, archaeologists, etc. – having relevant, recent experience in the conservation of cultural heritage resources.
- **proponent** means a person, agency, group or organization that carries out or proposes to carry out an undertaking or is the owner or person having charge, management or control of an undertaking.

1. Is there a pre-approved screening checklist, methodology or process in place?

An existing checklist, methodology or process may already be in place for identifying potential cultural heritage resources, including:

- one endorsed by a municipality
- an environmental assessment process e.g. screening checklist for municipal bridges
- one that is approved by the Ministry of Tourism, Culture and Sport (MTCS) under the Ontario government's Standards & Guidelines for Conservation of Provincial Heritage Properties [s.B.2.]

Part A: Screening for known (or recognized) Cultural Heritage Value

2. Has the property (or project area) been evaluated before and found not to be of cultural heritage value?

Respond 'yes' to this question, if all of the following are true:

A property can be considered not to be of cultural heritage value if:

- a Cultural Heritage Evaluation Report (CHER) - or equivalent - has been prepared for the property with the advice of a qualified person and it has been determined not to be of cultural heritage value and/or
- the municipal heritage committee has evaluated the property for its cultural heritage value or interest and determined that the property is not of cultural heritage value or interest

A property may need to be re-evaluated, if:

- there is evidence that its heritage attributes may have changed
- new information is available
- the existing Statement of Cultural Heritage Value does not provide the information necessary to manage the property
- the evaluation took place after 2005 and did not use the criteria in Regulations 9/06 and 10/06

Note: Ontario government ministries and public bodies [prescribed under Regulation 157/10] may continue to use their existing evaluation processes, until the evaluation process required under section B.2 of the Standards & Guidelines for Conservation of Provincial Heritage Properties has been developed and approved by MTCS.

To determine if your property or project area has been evaluated, contact:

- the approval authority
- the proponent
- the Ministry of Tourism, Culture and Sport

3a. Is the property (or project area) identified, designated or otherwise protected under the *Ontario Heritage Act* as being of cultural heritage value e.g.:

i. designated under the *Ontario Heritage Act*

- individual designation (Part IV)
- part of a heritage conservation district (Part V)

Individual Designation – Part IV

A property that is designated:

- by a municipal by-law as being of cultural heritage value or interest [s.29 of the *Ontario Heritage Act*]
- by order of the Minister of Tourism, Culture and Sport as being of cultural heritage value or interest of provincial significance [s.34.5]. **Note**: To date, no properties have been designated by the Minister.

Heritage Conservation District – Part V

A property or project area that is located within an area designated by a municipal by-law as a heritage conservation district [s. 41 of the *Ontario Heritage Act*].

For more information on Parts IV and V, contact:

- municipal clerk
- Ontario Heritage Trust
- local land registry office (for a title search)

---

ii. subject of an agreement, covenant or easement entered into under Parts II or IV of the *Ontario Heritage Act*

An agreement, covenant or easement is usually between the owner of a property and a conservation body or level of government. It is usually registered on title.

The primary purpose of the agreement is to:

- preserve, conserve, and maintain a cultural heritage resource
- prevent its destruction, demolition or loss

For more information, contact:

- Ontario Heritage Trust - for an agreement, covenant or easement [clause 10 (1) (c) of the *Ontario Heritage Act*]
- municipal clerk – for a property that is the subject of an easement or a covenant [s.37 of the *Ontario Heritage Act*]
- local land registry office (for a title search)

---

iii. listed on a register of heritage properties maintained by the municipality

Municipal registers are the official lists - or record - of cultural heritage properties identified as being important to the community.

Registers include:

- all properties that are designated under the *Ontario Heritage Act* (Part IV or V)
- properties that have not been formally designated, but have been identified as having cultural heritage value or interest to the community

For more information, contact:

- municipal clerk
- municipal heritage planning staff
- municipal heritage committee

---

iv. subject to a notice of:

- intention to designate (under Part IV of the *Ontario Heritage Act*)
- a Heritage Conservation District study area bylaw (under Part V of the *Ontario Heritage Act*)

A property that is subject to a **notice of intention to designate** as a property of cultural heritage value or interest and the notice is in accordance with:

- section 29 of the *Ontario Heritage Act*
- section 34.6 of the *Ontario Heritage Act.* **Note**: To date, the only applicable property is Meldrum Bay Inn, Manitoulin Island. [s.34.6]

An area designated by a municipal by-law made under section 40.1 of the *Ontario Heritage Act* as a **heritage conservation district study area**.

For more information, contact:

- municipal clerk – for a property that is the subject of notice of intention [s. 29 and s. 40.1]
- Ontario Heritage Trust

v. included in the Ministry of Tourism, Culture and Sport's list of provincial heritage properties

Provincial heritage properties are properties the Government of Ontario owns or controls that have cultural heritage value or interest.

The Ministry of Tourism, Culture and Sport (MTCS) maintains a list of all provincial heritage properties based on information provided by ministries and prescribed public bodies. As they are identified, MTCS adds properties to the list of provincial heritage properties.

For more information, contact the MTCS Registrar at registrar@ontario.ca.

3b. Is the property (or project area) a National Historic Site (or part of)?

National Historic Sites are properties or districts of national historic significance that are designated by the Federal Minister of the Environment, under the *Canada National Parks Act*, based on the advice of the Historic Sites and Monuments Board of Canada.

For more information, see the National Historic Sites website.

3c. Is the property (or project area) designated under the *Heritage Railway Stations Protection Act*?

The *Heritage Railway Stations Protection Act* protects heritage railway stations that are owned by a railway company under federal jurisdiction. Designated railway stations that pass from federal ownership may continue to have cultural heritage value.

For more information, see the Directory of Designated Heritage Railway Stations.

3d. Is the property (or project area) designated under the *Heritage Lighthouse Protection Act*?

The *Heritage Lighthouse Protection Act* helps preserve historically significant Canadian lighthouses. The Act sets up a public nomination process and includes heritage building conservation standards for lighthouses which are officially designated.

For more information, see the Heritage Lighthouses of Canada website.

3e. Is the property (or project area) identified as a Federal Heritage Building by the Federal Heritage Buildings Review Office?

The role of the Federal Heritage Buildings Review Office (FHBRO) is to help the federal government protect the heritage buildings it owns. The policy applies to all federal government departments that administer real property, but not to federal Crown Corporations.

For more information, contact the Federal Heritage Buildings Review Office.

See a directory of all federal heritage designations.

3f. Is the property (or project area) located within a United Nations Educational, Scientific and Cultural Organization (UNESCO) World Heritage Site?

A UNESCO World Heritage Site is a place listed by UNESCO as having outstanding universal value to humanity under the Convention Concerning the Protection of the World Cultural and Natural Heritage. In order to retain the status of a World Heritage Site, each site must maintain its character defining features.

Currently, the Rideau Canal is the only World Heritage Site in Ontario.

For more information, see Parks Canada – World Heritage Site website.

Part B: Screening for potential Cultural Heritage Value

4a. Does the property (or project area) contain a parcel of land that has a municipal, provincial or federal commemorative or interpretive plaque?

Heritage resources are often recognized with formal plaques or markers.

Plaques are prepared by:

- municipalities
- provincial ministries or agencies
- federal ministries or agencies
- local non-government or non-profit organizations

For more information, contact:

- municipal heritage committees or local heritage organizations – for information on the location of plaques in their community
- Ontario Historical Society's Heritage directory – for a list of historical societies and heritage organizations
- Ontario Heritage Trust – for a list of plaques commemorating Ontario's history
- Historic Sites and Monuments Board of Canada – for a list of plaques commemorating Canada's history

4b. Does the property (or project area) contain a parcel of land that has or is adjacent to a known burial site and/or cemetery?

For more information on known cemeteries and/or burial sites, see:

- Cemeteries Regulations, Ontario Ministry of Consumer Services – for a database of registered cemeteries
- Ontario Genealogical Society (OGS) – to locate records of Ontario cemeteries, both currently and no longer in existence; cairns, family plots and burial registers
- Canadian County Atlas Digital Project – to locate early cemeteries

In this context, adjacent means contiguous or as otherwise defined in a municipal official plan.

4c. Does the property (or project area) contain a parcel of land that is in a Canadian Heritage River watershed?

The Canadian Heritage River System is a national river conservation program that promotes, protects and enhances the best examples of Canada's river heritage.

Canadian Heritage Rivers must have, and maintain, outstanding natural, cultural and/or recreational values, and a high level of public support.

For more information, contact the Canadian Heritage River System.

If you have questions regarding the boundaries of a watershed, please contact:

- your conservation authority
- municipal staff

4d. Does the property (or project area) contain a parcel of land that contains buildings or structures that are 40 or more years old?

A 40 year 'rule of thumb' is typically used to indicate the potential of a site to be of cultural heritage value. The approximate age of buildings and/or structures may be estimated based on:

- history of the development of the area
- fire insurance maps
- architectural style
- building methods

Property owners may have information on the age of any buildings or structures on their property. The municipality, local land registry office or library may also have background information on the property.

Note: 40+ year old buildings or structure do not necessarily hold cultural heritage value or interest; their age simply indicates a higher potential.

A building or structure can include:

- residential structure
- farm building or outbuilding
- industrial, commercial, or institutional building
- remnant or ruin
- engineering work such as a bridge, canal, dams, etc.

For more information on researching the age of buildings or properties, see the Ontario Heritage Tool Kit Guide Heritage Property Evaluation.

Part C: Other Considerations

5a. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area) is considered a landmark in the local community or contains any structures or sites that are important to defining the character of the area?

Local or Aboriginal knowledge may reveal that the project location is situated on a parcel of land that has potential landmarks or defining structures and sites, for instance:

- buildings or landscape features accessible to the public or readily noticeable and widely known
- complexes of buildings
- monuments
- ruins

5b. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area) has a special association with a community, person or historical event?

Local or Aboriginal knowledge may reveal that the project location is situated on a parcel of land that has a special association with a community, person or event of historic interest, for instance:

- Aboriginal sacred site
- traditional-use area
- battlefield
- birthplace of an individual of importance to the community

5c. Is there local or Aboriginal knowledge or accessible documentation suggesting that the property (or project area) contains or is part of a cultural heritage landscape?

Landscapes (which may include a combination of archaeological resources, built heritage resources and landscape elements) may be of cultural heritage value or interest to a community.

For example, an Aboriginal trail, historic road or rail corridor may have been established as a key transportation or trade route and may have been important to the early settlement of an area. Parks, designed gardens or unique landforms such as waterfalls, rock faces, caverns, or mounds are areas that may have connections to a particular event, group or belief.

For more information on Questions 5.a., 5.b. and 5.c., contact:

- Elders in Aboriginal Communities or community researchers who may have information on potential cultural heritage resources. Please note that Aboriginal traditional knowledge may be considered sensitive.
- municipal heritage committees or local heritage organizations
- Ontario Historical Society's "Heritage Directory" - for a list of historical societies and heritage organizations in the province

An internet search may find helpful resources, including:

- historical maps
- historical walking tours
- municipal heritage management plans
- cultural heritage landscape studies
- municipal cultural plans

Information specific to trails may be obtained through Ontario Trails.

Table index

Figure index

Appendices

1. Introduction

The Brooks Road Landfill Site (Site) is located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario and is owned and operated by 2270386 Ontario Limited, herein referred to as Brooks Road Environmental (BRE, Owner, Proponent). The location of the Site is shown in Figure 1.1.

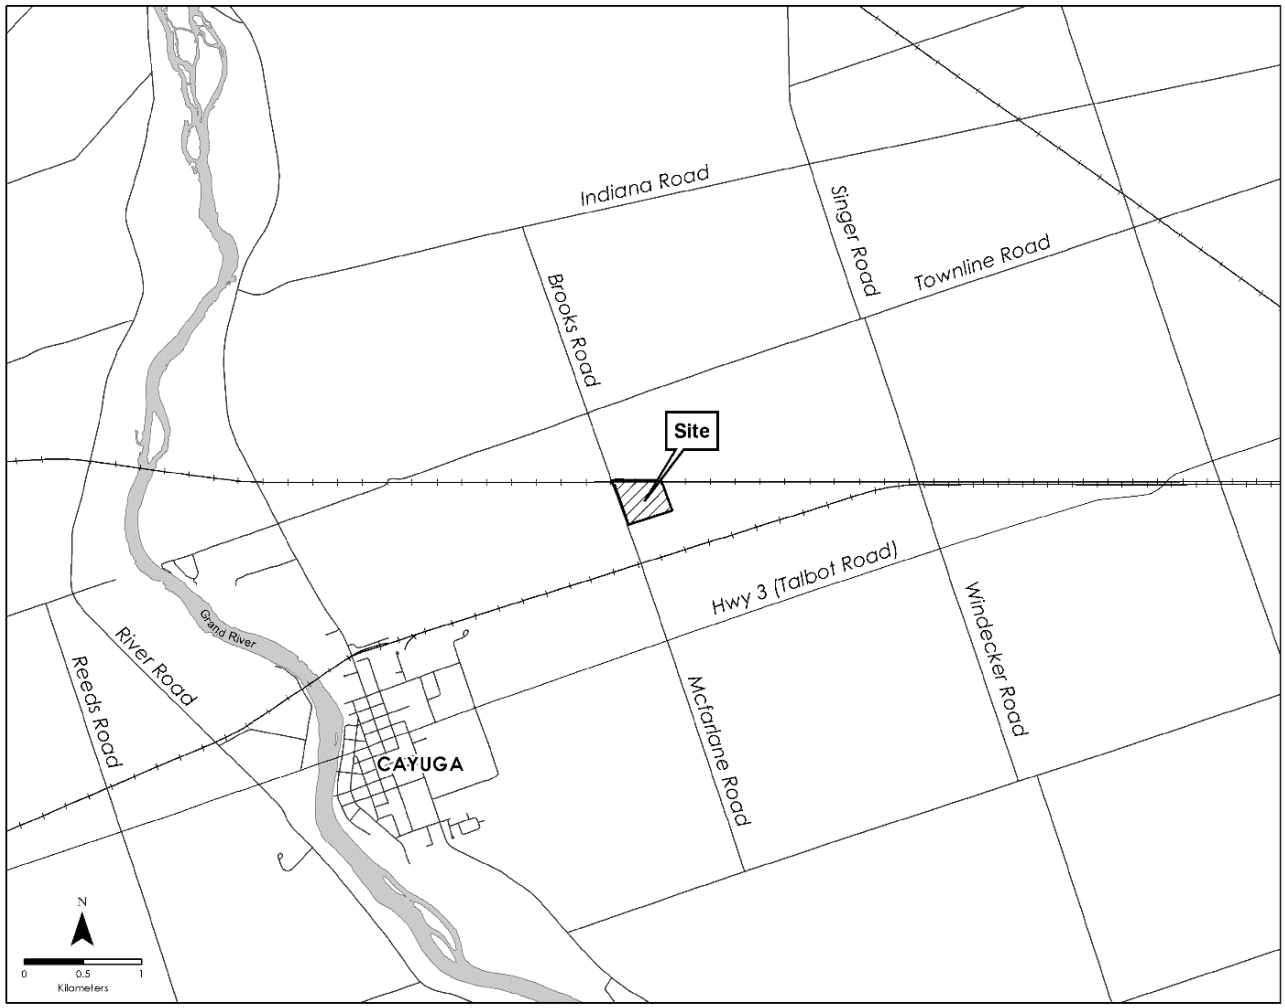

Figure 1.1 Location of the Proposed Undertaking

The Site, which operates under Environmental Compliance Approval (ECA) No. A110302 (Landfill ECA), has an approved annual fill rate of 250,000 tonnes per year and a total capacity of 1,045,065 cubic metres (m^3) (including waste and cover). The Site also operates under an air and noise ECA No. 7323-C6EJUM (Air ECA) and industrial sewage works ECA No. 1122-BKUPSM (Industrial Sewage ECA). The Site has accepted waste (in one form or another) since 1959 and received a Certificate of Approval (CofA, now referred to as an ECA) in 1980, with amendments approved by the Ministry of the Environment (currently the Ministry of Environment, Conservation and Parks (MECP) in 1980, 2002, 2004, 2005, 2007, 2011, 2012, 2013, 2014, 2017, 2018, 2020, and 2021. Under the current ECA, the Site is licenced to receive post-diversion solid non-hazardous Industrial, Commercial & Institutional (IC&I) waste from across Ontario. The 14.3-hectare (ha) Site contains an approved fill area of 6 ha.

In 2018, BRE completed an Individual Environmental Assessment (EA) to increase the total approved capacity at the site to allow for the continued receipt of post-diversion IC&I waste over a five-to-seven-year planning period and an amendment to the Site's rate of fill to provide for a maximum of 151,000 tonnes per year (known as the Brooks Road

Landfill Vertical Capacity Expansion EA). The Brooks Road Landfill Vertical Capacity Expansion EA was approved by the Minister of Environment, Conservation and Parks on January 15, 2019. The Site ECA was amended in 2021 to increase the annual rate of fill from 151,000 tonnes per year to a maximum of 250,000 tonnes per year, which is proportional to the daily maximum of 1,000 tonnes per day. The 2021 ECA amendment was subject to the Environmental Screening Process.

In order to meet the growing demand from waste generators and customer for a safe and reliable waste management facility for their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils), Brooks Road Environmental is proposing to expand the capacity of the Brooks Road Landfill by approximately 219,400 m^3, adding capacity equal to approximately two additional years. This expansion would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours), as well as increasing the existing landfill footprint to expand the Site horizontally, as shown in Figure 1.2.

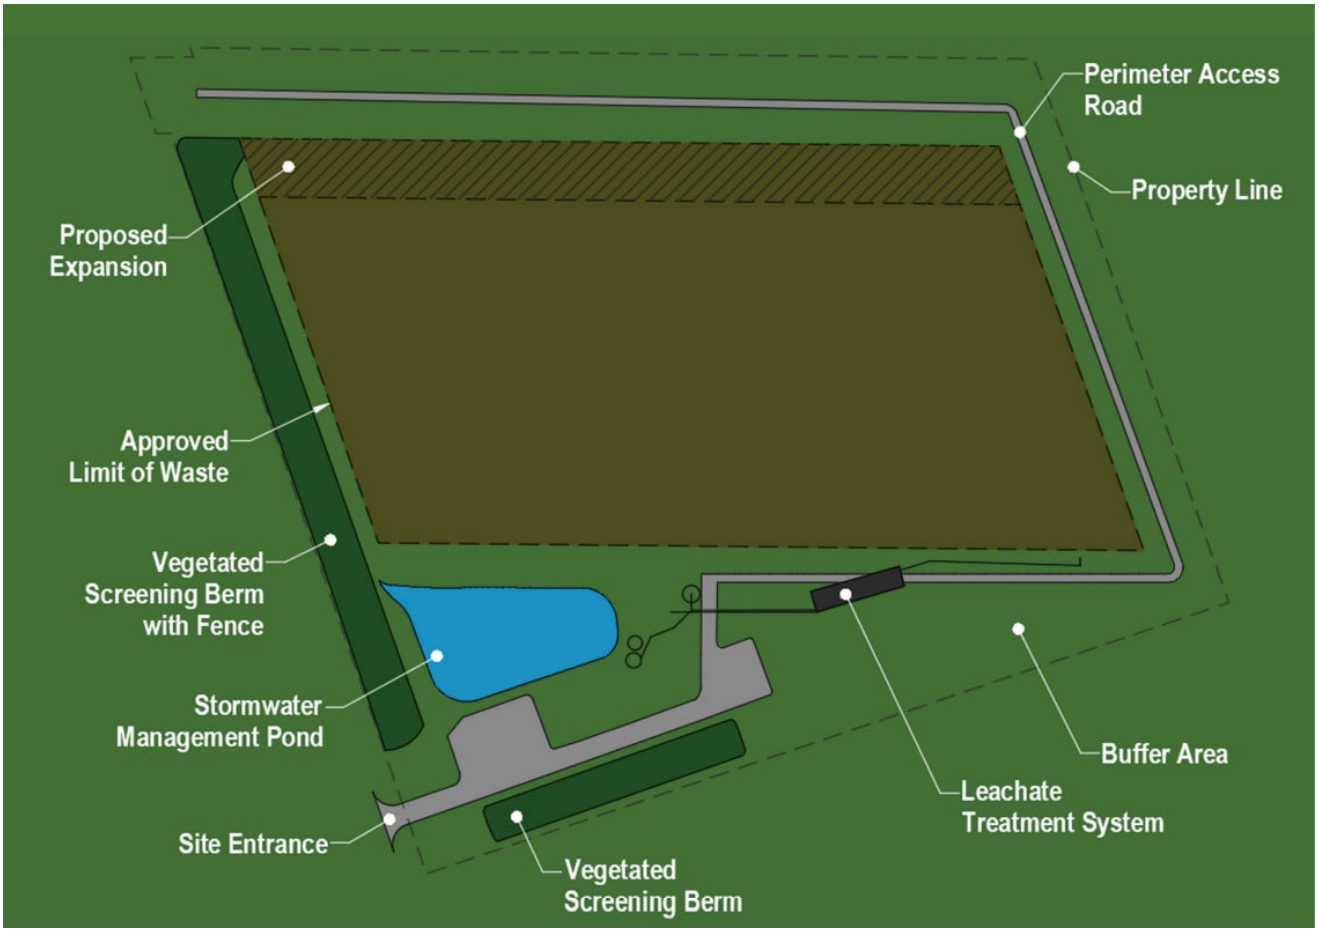

Figure 1.2 Proposed Capacity Expansion Concept

The proposed expansion would amend the approved ECA to allow for landfill volume expansion by approximately 219,400 m^3, allowing for receipt of an approved maximum daily quantity (1,000 tonnes per day) throughout the year, maintaining the approved rate of 250,000 tonnes per year. The proposed change to the total landfill capacity requires additional landfill infrastructure and changes to the currently approved landfill volume, footprint, and final contours.

The proposed Brooks Road Landfill Site capacity expansion is subject to the Environmental Screening Process in accordance with Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *EA Act*, as follows:

A change to a landfilling site or dump is defined as a major commercial or business enterprise or activity and is designated as an undertaking to which the Act applies, if the changes meet the following criteria:

1. *The total waste disposal volume of the landfilling site or dump after the change would exceed the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change by more than 100,000 cubic metres but by less than or equal to 375,000 cubic metres.*
2. *The increase in the total waste disposal volume of the landfilling site or dump would not exceed 25 per cent of the total waste disposal volume that the landfilling site or dump was authorized to have under the Environmental Protection Act before the change.*
3. *If a notice of completion under the Environmental Screening Process for Waste Management Projects has been submitted to the Ministry in respect of a previous change to the landfilling site or dump that meets the criteria in paragraphs 1 and 2, the day on which the notice of commencement is issued under the Environmental Screening Process for Waste Management Projects in respect of the change is at least 10 years after the day the notice of completion in respect of the previous change was submitted.*

Section 13 of Ontario Regulation 101/07 – Waste Management Projects Regulation exempts this Project from Part II of the *EA Act*, subject to fulfilling the Environmental Screening process. The Screening will be conducted in accordance with the planning and design process outlined in MECP "*Guide to Environmental Assessment Requirements for Waste Management Projects.*" The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to Stakeholders including Indigenous communities, the public, and government agencies. Upon completion of the Environmental Screening Process an application will be made to amend the existing ECA No. A110302.

GHD has prepared a Transportation Assessment on behalf of BRE for the proposed undertaking. This report documents the following as it relates to the transportation environment:

– Baseline/existing conditions (i.e., what exists in the absence of the proposed project).
– Potential effects on the environment, mitigation measures, and net effects.
– Future monitoring requirements to be implemented.

The Study Areas reviewed for the transportation assessment were as follows (see **Figure 1.3**):

– **Site Study Area (SSA)** – the 14.3 ha area within the existing, approved boundaries of the Site, as defined by ECA No. A110302, as amended; and
– **Local Study Area (LSA)** – the area within the vicinity of the Site extending approximately 1 kilometre (km) in all directions.

2. Screening Criteria Checklist

At the beginning of the Environmental Screening, the Screening Criteria Checklist (provided as Schedule I, pp 67 – 69, to the "Guide to Environmental Assessment Requirements for Waste Management Projects") is to be completed based on the information provided in the Project Description. The Screening Criteria reflect the broad definition of "environment" contained in the *Ontario Environmental Assessment Act.*

As noted in the Guide:

"*The Screening Criteria are presented in the form of a checklist with the option of a "Yes" or "No" response. Mitigation measures **are not** to be considered in concluding whether there is "No" potential environmental effect. That is, the proponent is required to answer "Yes" even if the proponent believes that a potential environmental effect could likely be mitigated. The reason for requiring a "Yes" is to ensure that mitigation measures are open to discussion and review. Another reason for this approach is that further discussion and review of a potential effect may reveal that there is no actual effect, in which case no mitigation is required. Where a "yes' has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance. Even where the proponent indicates that no environmental effects are anticipated, it is recommended that additional information is provided in the Environmental Screening Report in order to support the "no effects" conclusion*."

Each criterion is based on a question which is prefaced with the phrase, "*Might the Project*…" Table 2.1 was completed as the first step of the Environmental Screening Process and is a summary of the criteria for the Transportation discipline. Further descriptions of the criteria for which a "Yes" response was indicated in the Screening table are discussed in Section 4 of this report.

Table 2.1 Screening Criteria Checklist – Transportation

	Criterion	YES	NO	Additional Information
	Might the project…			
1. Socio-Economic				
6.8	Cause negative effects related to traffic?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects related to traffic through prolonging the life of the Site.

3. Existing Conditions

The following subsections describe the existing conditions that are found within the SSA and LSA of the proposed project.

3.1 Methodology

3.1.1 Available Secondary Source Information Collection and Review

Available secondary sources of information were collected and reviewed by the Transportation Study Team to determine existing Transportation conditions within the Study Area(s). The following sources of secondary information were collected and reviewed in completing the 2018 Individual Environmental Assessment:

– Haldimand County Annual Average Daily Traffic (AADT) data, 2005

– Haldimand County Annual AADT data, 2011

3.1.2 Process Undertaken

Information on the Transportation Existing Conditions within the Study Area was gathered from a combination of secondary source research, field investigations and discussions with Haldimand County staff.

3.1.3 Field Investigations

As part of the 2018 Individual Environmental Assessment, turning movement counts were conducted at the intersection of Highway 3 and Brooks Road and at the existing Brooks Road Landfill Site driveway during the weekday a.m., mid-day and p.m. peak periods and Saturday mid-day peak periods. These counts were completed on Saturday, December 5, 2015 and on Monday, December 7, 2015.

3.1.4 Agency Consultation

Also, as part of the 2018 Individual Environmental Assessment, discussions with Haldimand County staff took place in December 2015 to confirm AADT data.

3.2 Description of Existing Conditions

Road Network

The following two major roads provide access to the existing Brooks Landfill:

Highway 3 (Talbot Road) – within the vicinity of Brooks Road, Highway 3 (Talbot Road) is a two-lane road with a posted speed limit of 80 kph. The intersection of Highway 3 and Brooks Road is stop controlled on Brooks Road with both eastbound and westbound right turn taper on Highway 3.

Brooks Road – Brooks Road is a two-lane road that extends from Highway 3(Talbot Road) in the south and terminates at Indiana Road to the north. The speed limit on this road is 50 kph. Brooks Road is paved from Highway 3 to just north of the Brooks landfill driveway access where it changes to a gravel road for the remaining length to Indiana Road.

Traffic Data

Historical AADT data was obtained from Haldimand County. The 2005 AADT on Brooks Road approximately 500 metres north of Highway 3 was 144 two-way trips. In 2011 the AADT was slightly lower at 114 two-way trips. Discussions with staff confirmed that the split is approximately 50/50 between north and south volumes.

Turning movement counts were also conducted on Saturday, December 5, 2015 and on Monday, December 7, 2015 at both the intersection of Highway 3 and Brooks Road and at the existing Brooks Road Landfill Site driveway during the weekday a.m., mid-day and p.m. peak periods and Saturday mid-day peak periods. Detailed turning movement data sheets are found in Appendix A.

2022 Base Traffic Conditions

To establish the base 2022 traffic conditions and capture any expected background growth in traffic volumes at the study area intersections, a conservative compound annual growth rate of 2.0 percent was adopted and utilized to forecast grow the 2015 turning movement counts to 2022. The base 2022 traffic volumes also includes the estimated 16 site trucks per day as a result of the proposed vertical expansion approved in 2018. To provide a conservative and worst-case scenario analysis, all 16 of the daily truck trips associated with the vertical expansion were applied to each peak hour (i.e., all 16 would enter/exit the site within each of the peak hours which results in a large over estimation of the daily traffic volumes to the Site).

The resulting 2022 weekday a.m., mid-day and p.m. peak hour as well as the Saturday peak hour volumes are summarized in Figure 3.1.

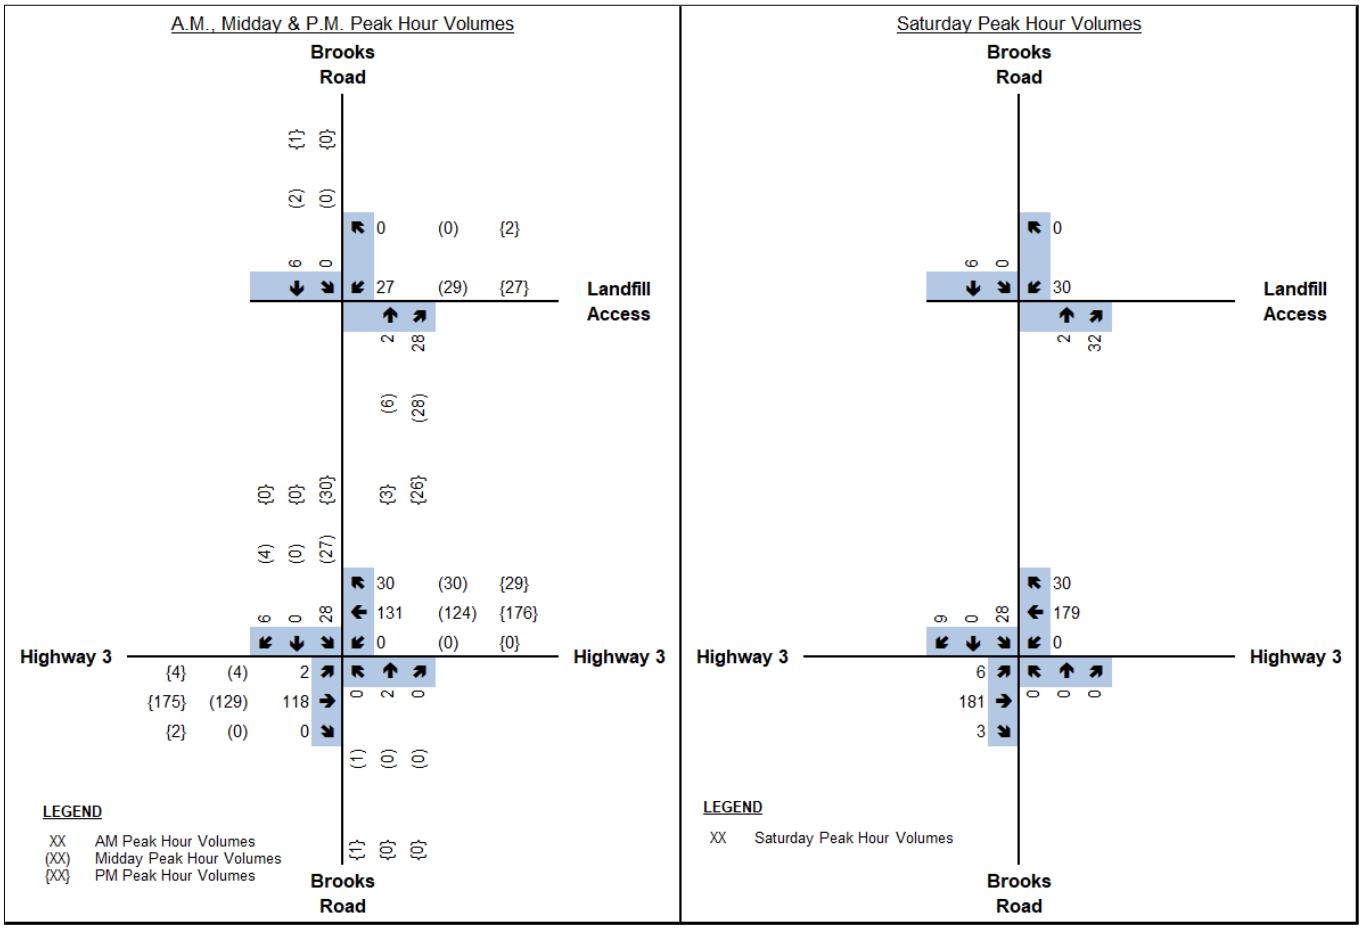

Figure 3.1 2022 Existing Peak Hour Volumes

Traffic on Brooks Road is predominately truck traffic specific to the landfill operation, traffic on Highway 3 is a mix of both commuter and truck traffic.

Landfill Operations

The Brooks Road Landfill Site is currently open and accepting waste during the week and on Saturdays. The site currently handles 1,000 tonnes of material per day based on the following five different truck configurations:

– Walking floor – can handle 25 to 40 metric tonnes per load
– Roll-off – can handle 0.5 to 10 metric tonnes per load
– Front End – can handle 3 to 12 metric tonnes per load
– Tri-axle – can handle 14 to 22 metric tonnes per load
– Dump trailer – can handle 34 to 42 metric tonnes per load

The current maximum daily truck traffic at the landfill assuming delivery of 1,000 tonnes of material per day is 16 to 24 walking floor trucks, 2 to 4 front end trucks and 2 to 6 roll-offs for a total of 34 inbound and 34 outbound trucks plus another one or two trips for staff over the period of a day. This number can increase slightly if there are certain soil jobs on the site as the walking floor trucks are replaced with Dump trailers and Tri-axle trucks.

The turning movement counts conducted at the site driveway on Saturday December 5, 2015 and Monday December 7, 2015 show the following total volume of trucks entering and exiting the landfill during the peak hours:

– Weekday am peak hour – 12 inbound and 11 outbound
– Weekday mid-day peak hour – 12 inbound and 13 outbound
– Weekday pm peak hour – 10 inbound and 13 outbound
– Saturday mid-day peak hour – 16 inbound and 14 outbound

The traffic volumes confirm that the peak operating times for the landfill occur during both the weekday and Saturday mid-day peak hours when the maximum volumes of inbound and outbound traffic were observed.

Coincidentally, a review of the 2015 traffic counts confirms that the volume of inbound and outbound traffic from the landfill during the two survey dates was considerably higher than the typically expected volumes provided by the operator assuming delivery of 1,000 tonnes of material per day. It was confirmed that during the two survey dates, there was a transfer of clean clay to another property that resulted in approximately 75 additional loads throughout both days.

As a result, the analysis of the existing 2022 conditions not only includes the approved vertical expansion but also includes additional traffic that is not typical for existing operations and results in slightly reduced capacity at both the site driveway on Brooks Road and at the intersection of Brooks Road and Highway 3.

Capacity Analysis

As a measure of the existing capacity on the adjacent road network surrounding the Brooks Landfill, both the site access on Brooks Road and the stop-controlled intersection of Brooks Road and Highway 3 were analyzed using the projected 2022 turning movement volumes for the weekday am, mid-day, pm and Saturday peak hours. A summary of the capacity analysis using Synchro version 10 is summarized in Table 3.1 below with detailed reports provided in Appendix A.

Table 3.1 Existing Capacity Analysis

Intersection	Movement v/c ratio (LOS) delay			
	A.M. Peak	Mid-Day Peak	P.M. Peak	Sat Peak
Brooks Road and Landfill access	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec	WBLR = 0.03 LOS A 9 Sec NBTR = 0.02 LOS A 0 Sec SBTL = 0 LOS A 0 Sec
Brooks Road and Highway 3	EBTLR = 0 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS B 11 Sec SBTLR = 0.05 LOS B 10 Sec	EBTLR = 0 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS B 11 Sec SBTLR = 0.05 LOS B 11 Sec	EBTLR = 0 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS B 12 Sec SBTLR = 0.06 LOS B 12 Sec	EBTLR = 0.01 LOS A 0 Sec WBTLR = 0 LOS A 0 Sec NBTLR = 0 LOS A 0 Sec SBTLR = 0.07 LOS B 12 Sec

The turning movements at both study intersections currently operate with levels of service ‘B’ or better during the weekday am, mid-day, pm and Saturday mid-day peak hours.

The analysis of existing conditions confirms no current capacity constraints at either study intersection despite the higher than normal traffic volumes captured during the survey of existing traffic volumes as a result of the movement of clean clay off-site.

Safety Analysis

Collision Analysis

A review of available data shows that there is no indication that either Highway 3 in the vicinity of Brooks Road, or Brooks Road north to the site has experienced significantly higher collision frequency than the historical average accident rate along Highway 3 in Haldimand County.

Sight Line Analysis

The site entrance in its current location satisfies the sight distance requirements for trucks approaching and departing from the site. Brooks Road is fairly straight with little deviation in the horizontal or vertical alignment. Existing sight distances are in excess of 350 metres both to the north and south of the driveway access which exceeds the required sight distance based on TACC standard of 85 metres for stopping sight distance which for a posted speed limit of 50 kph (60 kph design speed).

4. Potential Effects, Mitigation Measures & Net Effects

A Project Description, which includes proposed engineering design figures, was prepared so that potential environmental effects and mitigation measures could be identified. The following subsections provide a general summary of the proposed undertaking.

4.1 Description of Project Components and Activities

The project for which the Environmental Screening Process is being undertaken is a proposed capacity expansion of 219,400 m^3 and involves a change to the final site capacity, contours, and footprint. Some level of construction is required to implement the proposal. This would be a combination of re-engineering the Site's final contours to expand the Site vertically in the expansion area (not to exceed current approved peak contours, as well as increasing the existing landfill footprint to expand the Site horizontally. Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours. The former railway property would continue to provide buffer land for the Site. The Brooks Road Landfill will continue to operate within currently approved operating hours and current construction activities and daily operations will continue as usual. There are no changes to the annual fill rate limits (maximum 1,000 tonnes per day and 250,000 tonnes per year) proposed as part of this project.

A summary of the key elements of the proposed capacity expansion compared to the existing approved Site is provided in Table 4.1.

Table 4.1 Summary of Proposed Brooks Road Landfill Capacity Expansion Design vs Existing Landfill

Design Component	Existing Landfill	Proposed Capacity Expansion
Volume (m^3)	1,045,065	1,264,4651
Footprint Area (ha)	6.07	7.15
Peak Elevation (mAMSL) (top of final cover)	221.50	225.66
Peak Elevation – top of waste (mAMSL)	220.75	224.91
Crest of Slope Elevation (mAMSL)	221.0	225.30

Design Component	Existing Landfill	Proposed Capacity Expansion
Slopes (Top/Sides)	Top – 20:1 (5%) Sides – 4:1 (25%)	Top – 20:1 (5%) Sides – 4:1 (25%) New stage is 4:1 (25%) north side slope, extends to a new peak elevation (i.e., elevated 20:1 [5%] plateau), and the south side slope (25%) ties-in to existing approved top of waste plateau. All other sides remain the same.
Stormwater Pond	Permanent pool – 1,266 m^3 Total live storage – >5,502 m^3	Pond capacity is sufficient for the proposed expansion based on existing Stormwater Management Plan.
Stormwater Drainage Ditch		Stormwater drainage ditch shifted by 30 m. East and west ditches will extend to maintain full perimeter ditch.
Perimeter Roads		Northern perimeter access road shifted by 29 m. East access road extended as appropriate. Access road will extend west, proposed to connect to Brooks Road as a secondary site access (locked during normal operation). A turnaround area will be provided in the northwest corner.
Maximum Daily Truck Traffic	25 to 50	25 to 50
Post-Closure Leachate Generation Rate	33 m^3/day	39 m^3/day
Capacity anticipated to be reached (year)	2024	2026

4.2 Methodology and Investigations

The assessment of effects associated with the proposed undertaking was carried out through a series of steps that is based, in part, on the description of existing conditions as well as the Project Description and Site Plan. The assessment of effects was also undertaken within the context of the previously completed Screening Criteria Checklist, as summarized in **Section 2** of this report.

Based on the description of the Alternative Methods provided in **Section 2** and the characterization of Transportation Existing Conditions within the Study Area described in **Section 3**, the following section provides the Transportation Future Conditions within the Study Area and any recommended mitigation measures for the 2026 horizon year when the Site is anticipated to reach capacity. The future conditions traffic analysis utilizes the existing 2022 conditions as a baseline and incorporates additional corridor growth to the traffic volumes.

As previously presented in **Table 4.1**, the maximum daily truck traffic before and after the proposed capacity expansion does not change and remains at 25 to 50 trucks per day. As a result, the turning volumes entering and exiting the site access are not expected to change from exiting conditions.

4.3 Future Transportation Conditions

4.3.1 Methodology

Horizon Year

The proposed capacity expansion for the existing site is expected to extend the life of the landfill by one approximately two years from 2024 to 2026. Therefore, a future horizon year of 2026 has been assumed representing the worst-case

scenario which includes the anticipated corridor growth expected until the Site reaches capacity. Haldimand County's Traffic Impact Study Guidelines for developments generating less than 500 peak hour vehicle trips requires future conditions traffic analysis be conducted for both the opening year and 5 years after opening. However, post 2026, the Site will generate no traffic onto the surrounding road network and therefore, analysis of future conditions was limited to the 2026 horizon year.

Background Volume Growth Rate

In order to capture any expected background growth in traffic volumes at the study area intersections, a conservative compound annual growth rate of 2.0 percent has been adopted and will be utilized to forecast for the 2026 traffic volumes.

Future Traffic Volumes

The Forecasted 2026 turning movement counts were projected at both the intersection of Highway 3 and Brooks Road and at the existing Brooks Road Landfill Site driveway during the weekday a.m., mid-day and p.m. peak periods and Saturday mid-day peak periods. This includes the existing truck traffic corresponding to approximately 1,000 tonnes per day. As previously noted, to provide a conservative and worst-case scenario analysis, the daily truck trips associated with the Site were applied to each peak hour (i.e., the total amount of daily truck trips would enter/exit the site within each of the peak hours). The resulting weekday a.m., mid-day and p.m. peak hour as well as the Saturday peak hour volumes are summarized in Figure 4.1. No additional site trips were accounted for in the 2026 horizon year as the maximum daily number of trucks generated by the Site remains at 25 to 50 trucks after the proposed capacity expansion.

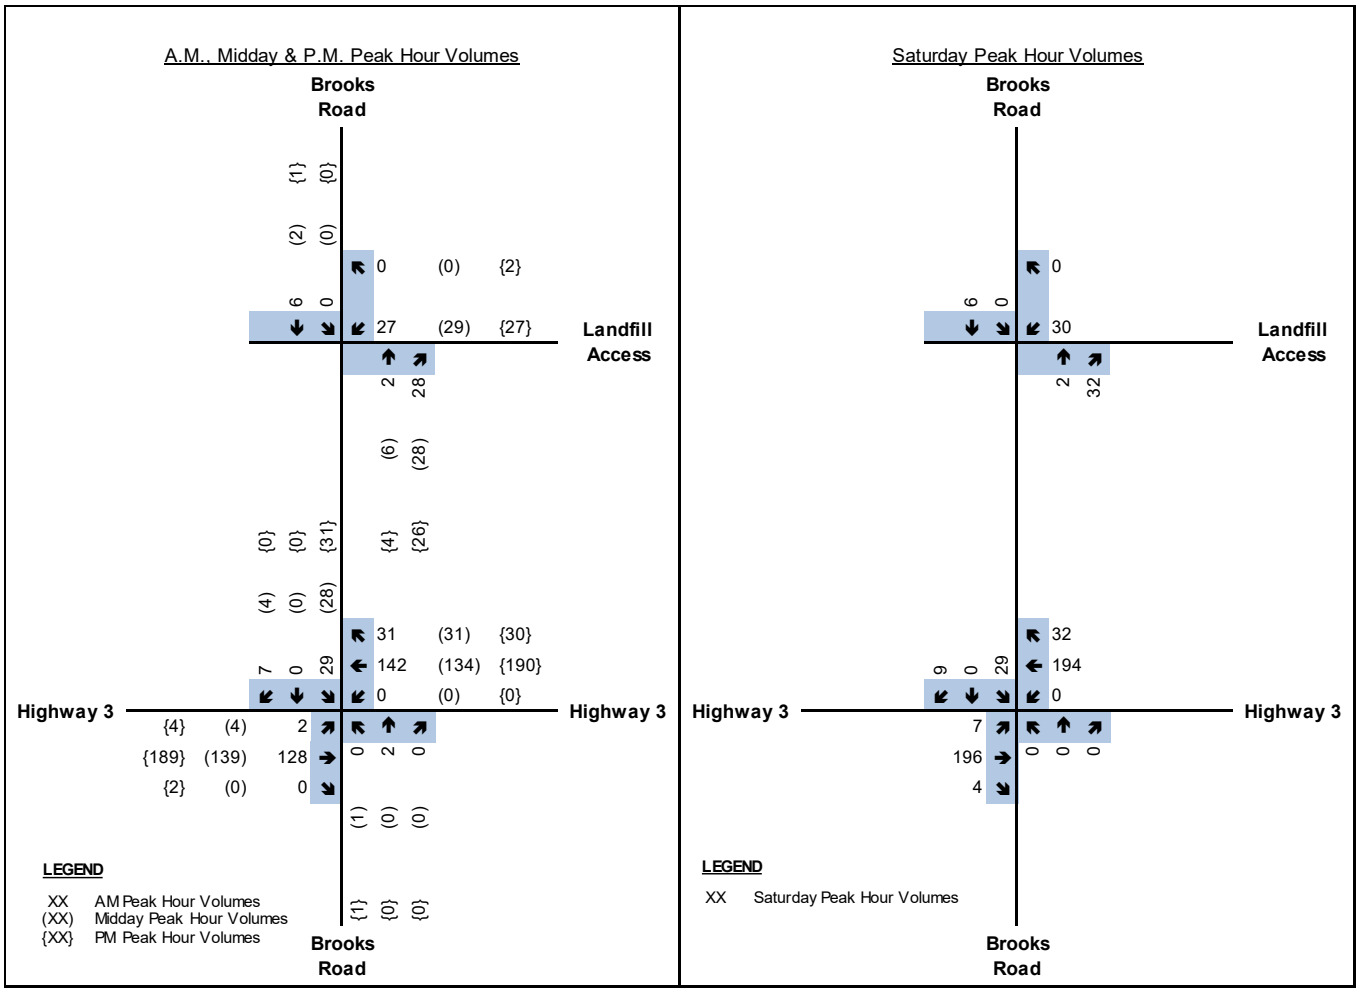

Figure 4.1 2026 Future Total Peak Hour Volumes

4.3.2 Capacity Analysis

As a measure of the capacity on the adjacent road network surrounding the Brooks Road Landfill at peak operations (i.e., 1,000 tonnes of material per day translating to 25 to 50 daily trucks), both the Site access on Brooks Road and the stop-controlled intersection of Brooks Road and Highway 3 were analyzed using the projected 2026 peak turning movement volumes for the weekday a.m., mid-day, p.m. and Saturday peak hours. A summary of the capacity analysis using Synchro version 10 is summarized in the Table 4.2 with detailed reports provided in Appendix A.

Table 4.2 2026Future Conditions Capacity Analysis at Peak Operations

Intersection	Movement v/c ratio (LOS) delay			
	A.M. Peak	Mid-Day Peak	P.M. Peak	Sat Peak
Brooks Road & Brooks Road Landfill Site access	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0 SEC	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0 SEC	WBLR = 0.03 LOS A 9 SEC NBTR = 0.02 LOS A 0 SEC SBTL = 0 LOS A 0 SEC
Brooks Road & Highway 3	EBTLR = 0 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS B 11 SEC SBTLR = 0.06 LOS B 11 SEC	EBTLR = 0 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS B 11 SEC SBTLR = 0.05 LOS B 11 SEC	EBTLR = 0 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS B 12 SEC SBTLR = 0.06 LOS B 12 SEC	EBTLR = 0.01 LOS A 0 SEC WBTLR = 0 LOS A 0 SEC NBTLR = 0 LOS A 0 SEC SBTLR = 0.08 LOS B 12 SEC

Both intersections overall are expected to operate with minimal delay and substantial excess capacity under future 2026 conditions. Individual movements at both study intersections are expected to operate with levels of service ‘B’ or better representing minimal delay, and volume-to-capacity (v/c) ratios not exceeding 0.08 representing substantial excess capacity, during the weekday a.m., mid-day, p.m. and Saturday mid-day peak hours.

The analysis of future 2026 conditions under peak operations confirms no vehicle delay issues or capacity constraints at either study intersection resulting from the proposed capacity expansion.

4.3.3 Safety Analysis

4.3.3.1 Collision Analysis

Existing conditions collision analysis determined no indication that either Highway 3 in the vicinity of Brooks Road or Brooks Road north to the site has experienced significantly higher collision frequency than the historical average accident rate along Highway 3 in Haldimand County. Since no additional site traffic is generated by the proposed capacity expansion, safety conditions remain unchanged.

4.3.3.2 Sight Line Analysis

Existing conditions sight line analysis determined the site entrance in its current location satisfies the sight distance requirements for trucks approaching and departing from the site.

4.4 Transportation Net Effects

This Section provides an assessment of the potential negative environmental effects (i.e., those for which a “Yes” answer was given in the Screening Criteria Checklist) for those Transportation criteria which might be affected by the project as identified in **Section 2**. The effects assessment describes how existing environmental conditions in the Study Area(s) would change as a result of the construction and operation of the proposed undertaking.

As described in Section 2, a “Yes” was applied to the following Transportation criteria:

6. Socio-Economic				
6.8	Cause negative effects related to traffic?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects related to traffic through prolonging the life of the Site.

With respect to the above criterion, a description of the potential negative environmental effects, necessary mitigation measures and the resultant net effects on the environment are discussed. Studies conducted during the Environmental Screening Process showed that the anticipated effects will be much less than expected or will not occur at all. In all cases, impact management (mitigation) measures have been identified that, when applied, will eliminate the potential environmental effects, or reduce them to acceptable levels.

4.4.1 Potential Effects on Transportation Environment

Based on the Future Conditions traffic analysis undertaken in **Section 4.1**, it is expected that the proposed capacity expansion will have a negligible transportation effect at the study area intersections and surrounding road network. Truck traffic associated with the proposed capacity expansion will not contribute any additional truck traffic within the study area, therefore it is not expected to adversely affect residents, businesses, institutions and movement of farm vehicles in the LSA.

4.5 Mitigation Measures

With no additional truck traffic generated by the proposed capacity expansion, no mitigation measures are recommended in order to avoid or minimize impacts on Transportation.

4.5.1 Net Effects

As no mitigation measures beyond those incorporated into the design are recommended, the net impacts of the capacity expansion from a transportation perspective are represented in the Future Transportation Conditions analysis undertaken in Section 4.1.

4.6 Monitoring Requirements

Since no mitigation measures were identified in **Section 4.5** are implemented as envisioned, no further monitoring of the transportation effects are recommended.

4.7 Additional Approvals

No additional approvals are required for transportation.

5. Conclusion

Under existing 2022 traffic conditions the site is expected to be acceptable from a traffic operations and safety perspective. The capacity analysis under peak operations confirms no current capacity constraints in the LSA road network. Concerning safety, a review of previously obtained data shows the LSA road network has not experienced significantly higher collision frequency than the local historical average accident rate, and a review of the site entrance in its current location satisfies the sight distance requirements.

The analysis of future conditions undertaken for the 2026 horizon year when the Site is anticipated to reach maximum capacity, indicates the site will continue to be acceptable from a traffic operations and safety perspective. Under peak operations no vehicle delay issues or capacity constraints at either study intersection are expected. Concerning safety, it is expected that since no additional site traffic is generated by the proposed capacity expansion, existing safety conditions will not deteriorate, and Site traffic will continue to be safely accommodated by the existing site entrance.

No mitigation measures beyond those incorporated into the design have been recommended as a result of the proposed capacity expansion.

Concerning the truck transportation effects along access roads, no effects are expected. With no additional traffic being generated by the Site, there is an expected minimal impact on traffic safety, traffic operations, and no potential road improvements are required or recommended.

Appendices

1. Introduction

This report summarizes the Public Open House for the Brooks Road Landfill Capacity Expansion Environmental Screening held on June 29th, 2022. Brooks Road Environmental (BRE), owners and operators of the Brooks Road Landfill in Haldimand County, Ontario, have initiated an Environmental Screening Process in accordance with Section 13 of the Waste Management Projects Regulation, (Ontario Regulation 101/07) of the Environmental Assessment Act (EA Act) for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. At the time of the first public open house, the capacity expansion proposed under this Environmental Screening Process was for approximately 100,000 cubic metres (m^3). This was changed in October 2023 to 219,400 m^3 as a result of a change in Ontario Regulation 101/07.

1.1 Objective of Open House

The main objectives of the Open House were to introduce the proposed undertaking; describe the Environmental Screening process; solicit feedback and comments on the proposed undertaking as well as how to best consult with the public going forward; meet the Project Team and ask questions regarding the undertaking and Environmental Screening process; and provide an update on Site developments occurring outside of the EA process.

Attendees were offered the opportunity to present their comments regarding the information directly to staff from BRE and GHD Limited (GHD).

1.2 Date, Time, and Location of Open House

The Public Open House was held on June 29, 2022, from 5 to 7 p.m. at the Cayuga Kinsmen Community Centre (15 Thorburn Street South, Cayuga, Ontario).

The Public Open House followed a drop-in format, with the information illustrated on a set of display panels arranged around the perimeter of the room. Project Team members were available to answer questions from attendees.

2. Notification

Notification of the Public Open House and Notice of Commencement was provided in the Sachem/Glanbrook Gazette and Haldimand Press newspaper publications (online and print) during the weeks of June 13 and 20, 2022.

In addition to the newspaper advertisement, notification of the Public Open House and Notice of Commencement was provided to the following identified agencies, Indigenous communities, and stakeholder groups on June 16, 2022:

- Haldimand County Mayor, Councillors, and relevant staff
- Grand River Conservation Authority
- Niagara Peninsula Conservation Authority
- Ministry of the Environment, Conservation & Parks (MECP)
- Ministry of Agriculture, Food and Rural Affairs
- Ministry of Heritage, Sport, Tourism and Cultural Industries
- Ministry of Education
- Ontario Provincial Police
- Grand Erie District School Board
- Ministry of Municipal Affairs – Ontario Growth Secretariat (formerly under the Ministry of Infrastructure)
- Ministry of Municipal Affairs and Housing

– Ministry of Northern Development, Mines, Natural Resources and Forestry
– Ministry of Transportation
– Métis Nation of Ontario (Head Office, Niagara Region Métis Council and Hamilton-Wentworth Métis Council)
– Six Nations of the Grand River First Nation
– Mississaugas of the Credit First Nation
– Haudenosaunee Confederacy Chiefs Council
– Haudenosaunee Development Institute
– Adjacent land owners and members of the public who had previously expressed an interest in the landfill

Notification was also provided to 1,674 addresses within the N0A postal code, covering the town of Cayuga, via unaddressed Canada Post mail-drop delivered during the week of June 20, 2022.

Copies of notification material are found in **Appendix A.**

3. Project Team Members in Attendance

The following project team members were in attendance at the Public Open House to answer questions:

Brooks Road Environmental	GHD
Tim Danyliw	Blair Shoniker Ryan Loveday Erika Brown Katrina McCullough Emily Cameron

4. Information Presented

Information presented at the Public Open House was in the form of display boards arranged around the room and organized to take the viewer through the process from project introduction to the history of the Site, Environmental Screening process, need/rationale, screening criteria checklist, and next steps in the process. This information included:

– Outline of the purpose of the Open House
– Project Overview
– About BRE and the existing landfill
– Outline of the Environmental Screening process
– Rational for the undertaking
– Proposed capacity expansion concept map
– Screening criteria checklist overview
– Screening criteria checklist
– Description of the Study Areas, including an aerial map
– List of the discipline existing environmental conditions assessments prepared as part of the EA
– Outline of the methodology for the assessment and evaluation of the Alternative Methods
– Summary of proposed mitigation measures and best management practices

– Overview of existing and ongoing odour management measures employed at the Site
– Summary of the findings of GHD's report on the abandoned gypsum mine within the Local Study Area
– Comparative evaluation results
– Next steps in the Environmental Screening process

Copies of the display panels are included in **Appendix B**.

5. Attendance

A total of fourteen individuals attended the Public Open House on June 29, 2022. Those in attendance included local residents and landowners; members of the Public Liaison Committee for the existing landfill; and a member of the media.

Comments ranged from against the proposal to supportive. The majority of comments received during the Open House related to the operations of the existing landfill. Landowners within the immediate vicinity of the site asked questions regarding the possible height of the expansion, visual impact, odour, noise, wetland protection, potential for impacts to surface and groundwater, traffic, site life, and post-closure use. Overall, there was good dialogue between the staff and the attendees.

Attendees were encouraged to provide written comments on the comment sheets provided.

All attendees who signed in were given the option to be added to the project-specific contact database. This database will be used during the remaining phases of the Environmental Screening process to contact and inform interested members of the public, Indigenous communities, and key stakeholders.

6. Summary of Comments Received

One comment sheet was submitted in person at the Public Open House, and one was submitted on July 13, 2022 via email. **Table 1** Summary of Comments Received below, summarizes the comments received. A copy of the email and letter received is included in Error! Reference source not found.**C.**

Table 1 Summary of Comments Received

No.	Comment
1.	Two ongoing concerns: stink and noise from tracked vehicles
2.	**Comments Questions Suggestions** <u>Vegetated screening berm (with fence)</u> – Increase fence height as required for increased height of land fill. – Start planting trees on berm for wind screening and visual appeal. <u>Buffer area</u> – Start planting permanent vegetation and trees if not already in progress. <u>Proposed expansion and temporary fill storage</u> – The area along the north boundary and maybe other areas not visible from the road. – Plant cover crop, vegetation – better than weeds – May be an opportunity for farmers. – Achieves dust, erosion and runoff control. – Plant permanent vegetation and trees as slopes are completed.

No.	Comment
	Dust control – Due to increased height of fill, use portable windscreens on hilltops as capacity. – expansion progresses. – Reference Stelco Nanticoke coal fields. Stormwater management pond – Plant native species typical of marsh – Improve filtering and subsequent runoff water quality. Odour and gaseous emissions – Found answers to most of my concerns in the FAQ section: – Are smelly additions perfumed or are they treated? – Treat with “odour control product”, hydrogen peroxide or some other oxidizer other than – bleach? – Aerate or vacuum the build-up with underlayed temporary piping as it progresses? – Has a ground gas collection and treatment system been installed? – If not will it be installed as filling progresses? Future use – toboggan hill!

Appendix A

Notification

Notice of Commencement of an Environmental Screening & Public Open House – Brooks Road Landfill Capacity Expansion

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act* (EA Act) for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 100,000 cubic metres (including waste and daily/final cover).

The proposed capacity expansion is subject to the Environmental Screening Process, as stated in Section 15 of the Waste Management Projects Regulation (O. Reg. 101/07) of the EA Act. The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste. The proposed capacity expansion will add capacity equal to approximately one additional year of waste acceptance over and above the remaining/ current approved capacity. There are no changes to the annual fill rate limits proposed as part of this project.

The location of the Brooks Road Landfill Site is shown on the map below. The purpose of the Environmental Screening is to study the potential effects of the capacity expansion on the environment.

The Process

As described above, the proposed project is subject to the Ministry of the Environment, Conservation and Parks (MECP) Environmental Screening Process for waste management projects in accordance with O. Reg. 101/07 under the EA Act. The Environmental Screening will be conducted in accordance with the planning and design process outlined in the Ontario MECP's "Guide to Environmental Assessment Requirements for Waste Management Projects." The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to the public, Indigenous communities, and government agencies.

Consultation and Public Open House #1

Members of the public, Indigenous communities, agencies, and other interested persons are encouraged to actively participate in the planning process by attending consultation events or contacting Project Team staff directly with questions. Consultation activities are planned throughout the Environmental Screening Process and will be advertised via direct and/or electronic mail, in the local newspaper, and on the project website (www.brenvironmental.com).

The first **Public Open House** for the Environmental Screening Process is scheduled for **June 29, 2022**. The details of the Public Open House are as follows:

Date: Wednesday, June 29, 2022 Drop In Time: 5 p.m. to 7 p.m.

Location: Cayuga Kinsmen Community Centre – 15 Thorburn Street South, Cayuga

You are encouraged to attend the Public Open House and to submit your comments via the project website (www.brenvironmental.com), mail, email or telephone to the addresses/numbers below.

If you would like to be added to our project mailing list or have project-related questions, please contact:

Premiere screening of 'Canfield Roots' to raise funds for Canfield Community Centre, featured in documentary

To The Haldimand Press

CANFIELD—Windecker Road Films and Canfield Community Centre invite you to the premiere screening of the home-grown documentary Canfield Roots on Thursday, June 23, 2022 at 7 p.m. in Canfield.

Doubling as a fundraiser for the Canfield Community Centre, which was featured in the series, the evening will also include an introduction to local history by historian Sylvia Weaver, an exciting live auction featuring fantastic local donations, and a question and answer session with Director Graeme Bachiu and Street family descendants Aileen Duncan and Spencer Martin, who are featured in the documentary.

"There's no better place for my first Canfield Roots screening than Canfield Community Centre. The team at this hall was so helpful and accommodating as I shot the film, so it's important to me to show my gratitude for their support. And, it's key to recognize the important role that all community halls play. Canfield Community Centre, and other rural halls like it, are vital to maintaining and strengthening community bonds and providing a space for groups to gather," said Bachiu.

This first-ever in-person screening of Canfield Roots will debut a 75-minute director's cut of the popular series that aired earlier this year on numerous PBS stations across North America, including WNED PBS – where the first episode alone garnered over 10,000 viewers from southern Ontario and western New York, prompting the station to add a second run for the series in the spring. The original documentary series, made up of six 25-minutes segments, is available for digital rental or purchase at

windeckerroadfilms.com.

The evening's auction will be helmed by a guest auctioneer, local Haldimand County Ward 6 Councillor Bernie Corbett. Items available include a limited-edition framed Canfield Roots Poster donated by Bachiu, a signed book by Canfield author Brad Smith, a luxurious gift basket and experience from Purple Haven Lavender Farm, a chocolate charcuterie plate from Sweet Retro-Spect, and more.

Canfield Community Centre President Bart Barnes is looking forward to hosting a big event once again. "Over the last two years of the pandemic, we've had to keep our hall closed and have therefore lost a great deal of revenue. This fundraiser will go a long way in helping us gain some revenue to help maintain the hall and keep our rates affordable for community members," said Barnes, who has been president of Canfield Community Centre for 15 years.

As with many rural halls, Canfield Community Centre is a popular choice for family Christmas parties and birthday parties, wedding showers and baby showers, as well as smaller weddings and stag and doe parties.

Admission to the Canfield Roots screening is $10 per person. Popcorn, drinks, and Canfield Roots DVDs will be available to purchase. Those interested in purchasing tickets can send a message to the Canfield Community Centre on Facebook (link: fb.me/e/2tlqD8I0b), call or text 905-772-5790, or buy tickets at the door.

"I can't wait to celebrate in Canfield with the many people who helped make Canfield Roots possible – from our incredible cast and crew, to our sponsors, to the many locals who shared their family history with me," said Bachiu. "This was a real passion project that spanned three years, and I'm truly grateful to the many people who gave of their time and talents. I couldn't have done it without them."

Sharing the history of some of the Black families who lived and thrived in a small rural town, Canfield Roots follows present-day descendants in Canada and the US as they learn about their family history, share their early experiences, and fight to preserve the Street cemetery, now the focus of a restoration project. Located on private land, the cemetery is the final resting place of freedom seekers and the last remaining evidence that those freedom seekers lived in Canfield. To view the Canfield Roots trailer, visit

windeckerroadfilms.com.

Educators interested in educational licensing of the Canfield Roots docuseries can visit McIntyre Media for more information and to order the series. Groups wanting to book an in-person or virtual screening, complete with personalized Q&A with Director/Producer Graeme Bachiu, will be sent a screening toolkit including pricing and event planning tools and tips. Contact graeme@windeckerroadfilms.com for more information.

CANFIELD—Canfield Roots Director/Producer Graeme Bachiu poses in front of the Canfield Community Centre marquee, where the premiere of Canfield Roots is taking place on Thursday, June 23. *—Submitted photo.*

Notice of Commencement of an Environmental Screening & Public Open House – Brooks Road Landfill Capacity Expansion

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act* (EA Act) for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 100,000 cubic metres (including waste and daily/final cover).

The proposed capacity expansion is subject to the Environmental Screening Process, as stated in Section 13 of the Waste Management Projects Regulation (O. Reg. 101/07) of the EA Act. The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste. The proposed capacity expansion will add capacity equal to approximately one additional year of waste acceptance over and above the remaining/ current approved capacity. There are no changes to the annual fill rate limits proposed as part of this project.

The location of the Brooks Road Landfill Site is shown on the map below. The purpose of the Environmental Screening is to study the potential effects of the capacity expansion on the environment.

The Process

As described above, the proposed project is subject to the Ministry of the Environment, Conservation and Parks (MECP) Environmental Screening Process for waste management projects in accordance with O. Reg. 101/07 under the EA Act. The Environmental Screening will be conducted in accordance with the planning and design process outlined in the Ontario MECP's "Guide to Environmental Assessment Requirements for Waste Management Projects." The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to the public, Indigenous communities, and government agencies.

Consultation and Public Open House #1

Members of the public, Indigenous communities, agencies, and other interested persons are encouraged to actively participate in the planning process by attending consultation events or contacting Project Team staff directly with questions. Consultation activities are planned throughout the Environmental Screening Process and will be advertised via direct and/or electronic mail, in the local newspaper, and on the project website (www.brenvironmental.com).

The first **Public Open House** for the Environmental Screening Process is scheduled for **June 29, 2022**. The details of the Public Open House are as follows:

Date: Wednesday, June 29, 2022 Drop In Time: 5 p.m. to 7 p.m.

Location: Cayuga Kinsmen Community Centre – 15 Thorburn Street South, Cayuga

You are encouraged to attend the Public Open House and to submit your comments via the project website (www.brenvironmental.com), mail, email or telephone to the addresses/numbers below.

If you would like to be added to our project mailing list or have project-related questions, please contact:

World Knitting in Public Day celebrated in Jarvis

JARVIS—Knitting needles and crochet hooks were in motion for all to see as members of the Jarvis Knitting Social Club participated in the annual World Knitting in Public Day on June 11, 2022 at the Jarvis Library. Whether in sunshine or shade, participants enjoyed an afternoon of creating and conversation. The many projects being worked on included baby hats for St. Joseph's Hospital, a neck warmer, a Persian tile Afghan, towel tops for hand towels, and poppies for the Haldimand Horticultural Society. Most in attendance have been knitting or crochet enthusiasts for decades, having learned from their mothers, grandmothers, or in Home Economics class. Pictured is (sitting, l-r) Kim Slavinsky, Cathy Hill, Karen Bootsma, (standing) Alexis Hayes, Laurel Porteous, Jenny Eggink, and Wanda Nelson, Jarvis Library staff. The Jarvis Knitting Social Club meets at the library on Thursdays from 2 p.m. to 4 p.m. and new members are always welcome. —Haldimand Press photo by Sheila Phibbs.

OPP continue search for missing 74-year-old boater near Port Maitland

By Haldimand Press Staff

DUNNVILLE—Haldimand OPP, the OPP Marine Unit, and OPP Aviation Services, along with the Joint Rescue Coordination Centre (JRCC) based out of Trenton, Niagara Regional Police and Canadian Coast Guard continue searching for an overdue boater near Port Maitland.

On Thursday, June 16 at 5:20 p.m., Haldimand County OPP received a dispatch call for a missing 74-year-old male that had gone fishing at 4 a.m. and had not yet returned.

An OPP helicopter searched the area last night with JRCC assistance.

Victim Services has been engaged with the family members.

As of Monday, June 20, Constable Mary Gagliardi said, "The OPP Underwater Search and Recovery Unit, OPP Aviation Services, and OPP Marine Unit are still searching."

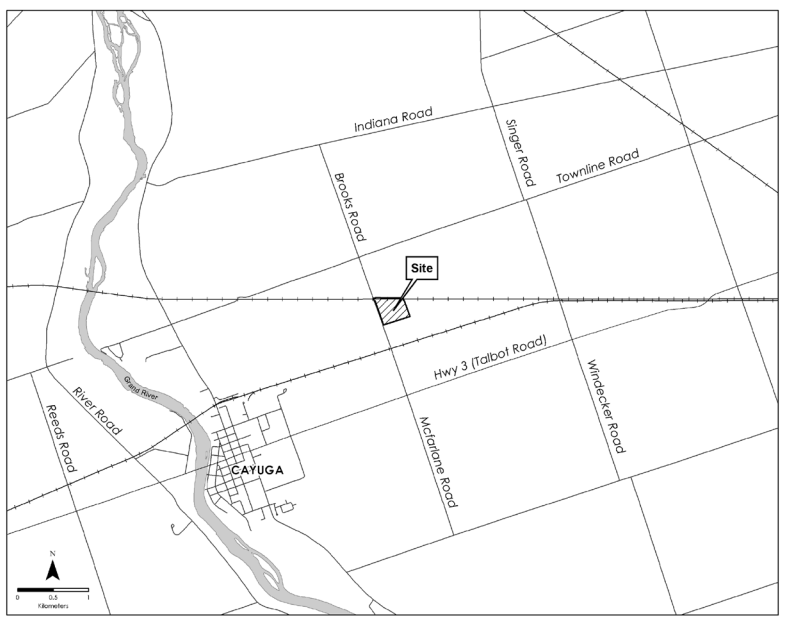
Updates will be provided as information becomes available.

Notice of Commencement of an Environmental Screening & Public Open House – Brooks Road Landfill Capacity Expansion

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act (EA Act)* for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 100,000 cubic metres (including waste and daily/final cover).

The proposed capacity expansion is subject to the Environmental Screening Process, as stated in Section 13 of the Waste Management Projects Regulation (O. Reg. 101/07) of the *EA Act*. The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste. The proposed capacity expansion will add capacity equal to approximately one additional year of waste acceptance over and above the remaining/ current approved capacity. There are no changes to the annual fill rate limits proposed as part of this project.

The location of the Brooks Road Landfill Site is shown on the map below. The purpose of the Environmental Screening is to study the potential effects of the capacity expansion on the environment.



The Process

As described above, the proposed project is subject to the Ministry of the Environment, Conservation and Parks (MECP) Environmental Screening Process for waste management projects in accordance with O. Reg. 101/07 under the *EA Act.* The Environmental Screening will be conducted in accordance with the planning and design process outlined in the Ontario MECP's "Guide to Environmental Assessment Requirements for Waste Management Projects." The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to the public, Indigenous communities, and government agencies.

Consultation and Public Open House #1

Members of the public, Indigenous communities, agencies, and other interested persons are encouraged to actively participate in the planning process by attending consultation events or contacting Project Team staff directly with questions. Consultation activities are planned throughout the Environmental Screening Process and will be advertised via direct and/or electronic mail, in the local newspaper, and on the project website (www.brenvironmental.com).

The first **Public Open House** for the Environmental Screening Process is scheduled for **June 29, 2022**. The details of the Public Open House are as follows:

Date: Wednesday, June 29, 2022 Drop In Time: 5 p.m. to 7 p.m.
Location: Cayuga Kinsmen Community Centre – 15 Thorburn Street South, Cayuga

You are encouraged to attend the Public Open House and to submit your comments via the project website (www.brenvironmental.com), mail, email or telephone to the addresses/numbers below.

If you would like to be added to our project mailing list or have project-related questions, please contact:

Dear Government Review Team Members,

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act* for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 100,000 cubic metres (including waste and daily/final cover).

Please find attached a copy of the Notice of Commencement of an Environmental Screening and Public Open House. The Notice of Commencement and Public Open House will appear in the local papers as well as being sent out via mail and email to the public and Indigenous communities.

We would like to hold a Government Review Team update meeting during the Screening. Future update meetings are anticipated to be held around key milestones and will be communicated to you well in advance.

We will continue to notify you about this Environmental Screening, unless we hear from you stating that you do not wish to be consulted on this undertaking. For further information on the proposed study, please feel free to contact the undersigned and visit https://www.brenvironmental.com/ for further details to be posted throughout the process.

Public Open House No.1

Brooks Road Landfill Capacity Expansion Environmental Screening

Purpose of the Open House

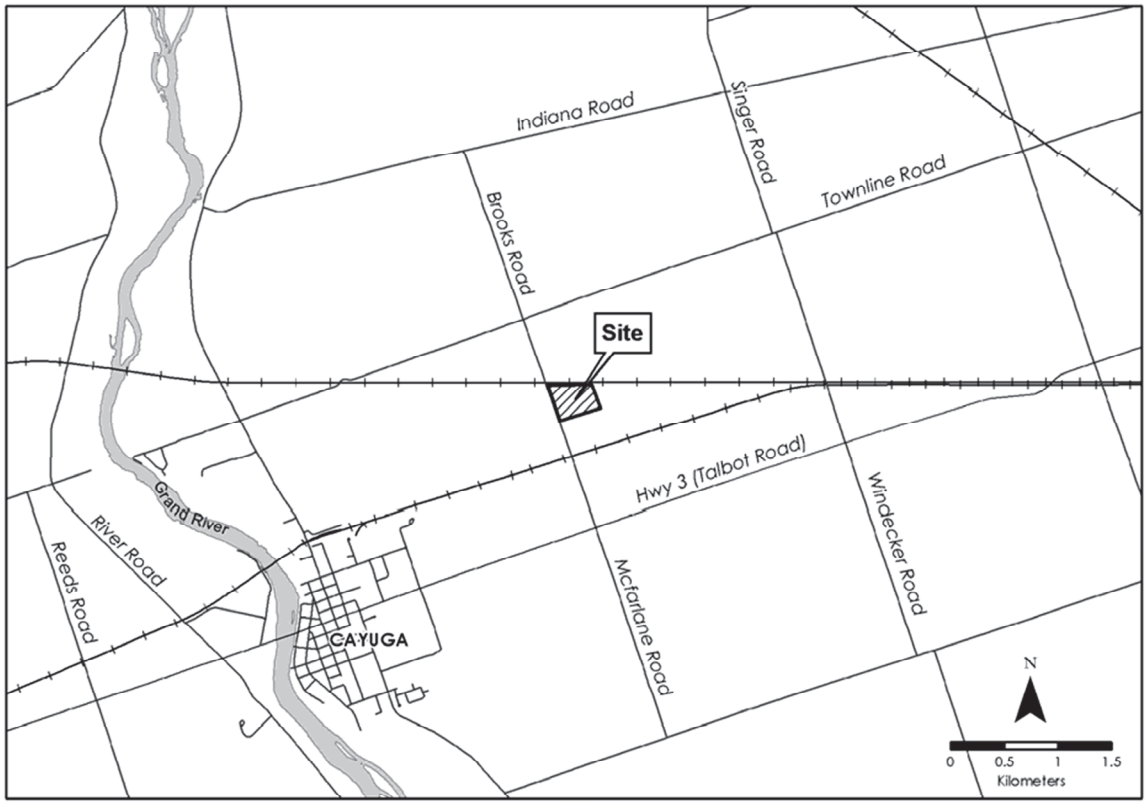
The purpose of this Public Open House is to share information about the Environmental Screening for the proposed Brooks Road Landfill Capacity Expansion and to obtain your comments for consideration by Brooks Road Environmental.

This Open House will:

- Describe the purpose of the proposed Capacity Expansion
- Introduce Brooks Road Environmental
- Outline the Environmental Screening Process
- Summarize the Problem/Opportunity and Project Description
- Present the completed Screening Criteria Checklist
- Identify next steps in the Environmental Screening Process

Project Overview

Brooks Road Environmental has initiated an Environmental Screening Process for a proposed capacity expansion of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario, shown on the Site map below.



- The capacity expansion proposed under this Environmental Screening Process is for approximately 100,000 cubic metres.
- The proposed capacity expansion will add capacity equal to approximately one additional year of waste over and above the remaining/ current approved capacity.

Brooks Road Environmental

Brooks Road Landfill is a 100% Canadian owned and managed sustainable landfill serving waste generators in Southwestern Ontario.

- Brooks Road Environmental is committed to providing cost-effective and environmentally-sound disposal for solid waste, including impacted soils, generated by industries and businesses.
- With a capacity of 1,000 tonnes per day, Brooks Road Landfill can meet the waste disposal needs of more than 5 million people while protecting our surrounding environment.
- As a part of the community we serve, Brooks Road Environmental is proud to sponsor a number of local organizations, including Cayuga Food Bank and the Dunnville Fair.
- The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste.

Environmental Screening Process

An Environmental Screening is an approvals process for projects that have predictable environmental effects that can be readily mitigated.

- This Project is subject to an Environmental Screening Process in accordance with Section 13 of the Waste Management Projects Regulation, (Ontario Regulation 101/07) of the *Environmental Assessment Act.*
- The Project will be conducted in accordance with the Ministry of Environment, Conservation and Parks “Guide to Environmental Assessment Requirements for Waste Management Projects”.
- Results of the Environmental Screening will be documented in an Environmental Screening Report, which will be released for public and agency review.

Environmental Screening Process

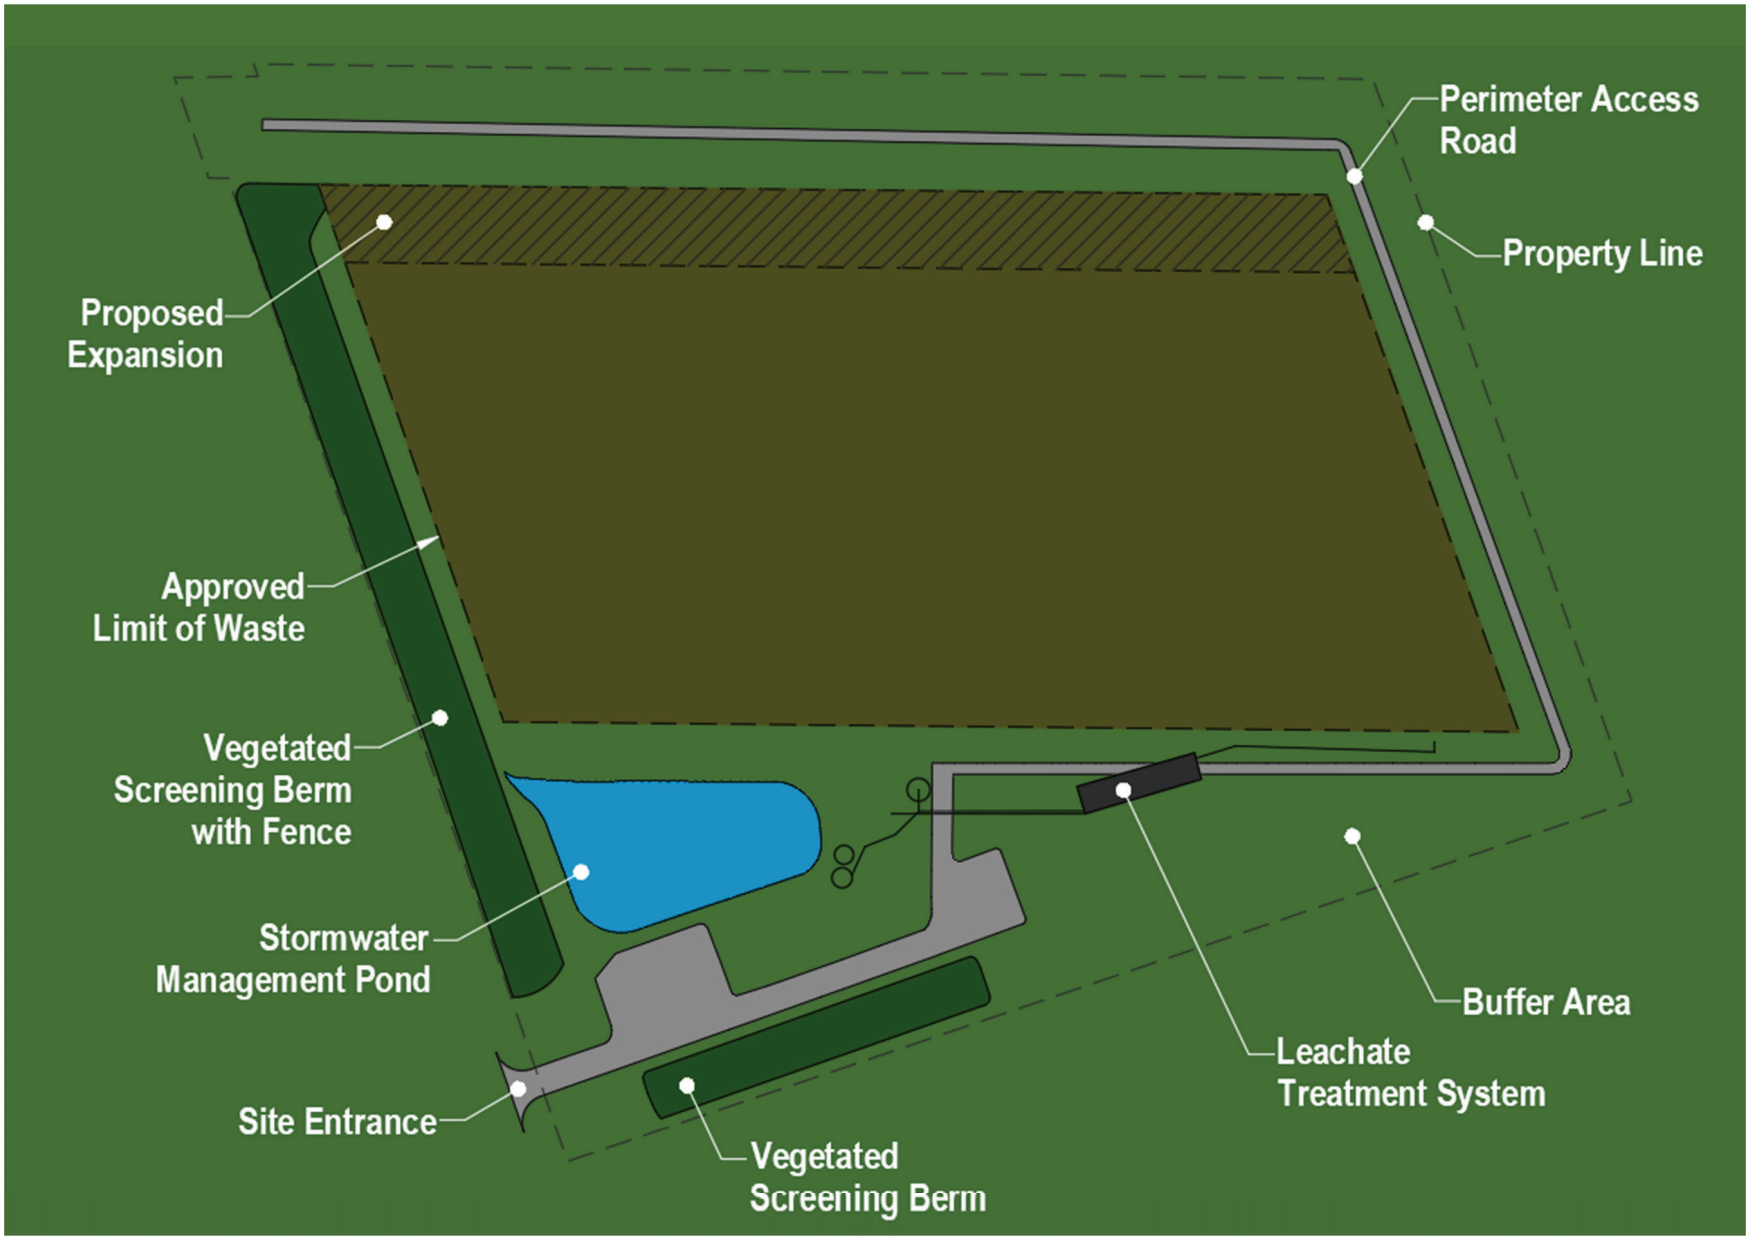
This Public Open House is an important part of the Environmental Screening Process to consult and engage with stakeholders in the process (Steps 1 – 5).

Step 1	Publish Notice of Commencement and Public Open House
Step 2	Identify Problem or Opportunity and Project Description
Step 3	Apply Screening Criteria
Step 4	Describe Potential Environmental Effects, Concerns, and Issues
Step 5	Consultation and Public Open House #1
Step 6	Conduct Studies and Assessment of Potential Environmental Effects
Step 7	Develop Impact Management/ Mitigation Measures
Step 8	Consultation and Public Open House #2
Step 9	Identify Significant Net Effects and Resolve Concerns (if required)
Step 10	Conduct Additional Studies and Assessment (if required)
Step 11	Prepare Environmental Screening Report
Step 12	Publish Notice of Completion
Step 13	Resolve Elevation Requests (if required)
Step 14	Submit Statement of Completion to the Ministry of the Environment, Conservation and Parks

Problem / Opportunity & Project Description

- There is an opportunity to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils).
- The proposed expansion would increase the capacity of the Site by approximately 100,000 cubic metres, adding capacity equal to approximately one additional year.
- This would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically, as well as increasing the existing landfill footprint to expand the Site horizontally.
- Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours.
- The former railway property would continue to provide buffer land for the Site.

Proposed Capacity Expansion Concept



As part of the initiation of the Environmental Screening Process, the Screening Criteria Checklist has been completed based on the information provided in the Project Description.

Screening Criteria Checklist

- The Screening Criteria are presented in the form of a checklist with the option of a “Yes” or “No” response. Mitigation measures are not to be considered in concluding whether there is “No” potential environmental effect. That is, the proponent is required to answer “Yes” even if the proponent believes that a potential environmental effect could likely be mitigated.
- Where a “Yes” has been identified, the proponent is to provide additional information in the Environmental Screening Report, explaining the potential effect(s), methods to mitigate or address the effect(s), any net effects that are anticipated and if so, their significance.

Screening Criteria Checklist

	CRITERION MIGHT THE PROJECT…	YES	NO	ADDITIONAL INFORMATION
1. Surface & Groundwater				
1.1	Cause negative effects on surface water quality, quantities, or flow?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause potential negative effects on surface water quality, quantities, or flows.
1.2	Cause negative effects on groundwater quality, quantity, or movement?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on groundwater quality, quantity, or movement.
1.3	Cause significant sedimentation or soil erosion or shoreline or riverbank erosion on or off site?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause sedimentation on or off site.
1.4	Cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on surface or groundwater from accidental spills or releases (e.g., leachate) to the environment.
2. Land				
2.1	Cause negative effects on residential, commercial, institutional, or other sensitive land uses within 500 metres from the site boundary?		X	The proposed undertaking is a continuation of the existing operation through an expansion within the existing site. No change to land use is being proposed. As such, no negative effects are anticipated on the lands or land uses within 500m the Site as a result of the Project.
2.2	Not be consistent with the Provincial Policy Statement, provincial land use or resource management plans?		X	The proposed landfill expansion would continue to be consistent with the Provincial Policy Statement, provincial land use and/or resource management plans.
2.3	Be inconsistent with municipal land use policies, plans and zoning bylaws (including municipal setbacks)?		X	The proposed landfill expansion would continue to be consistent with municipal land use policies, plans and zoning bylaws (including municipal setbacks). No new lands are required and no changes to existing zoning are required.
2.4	Use lands not zoned as industrial, heavy industrial or waste disposal?		X	The proposed landfill expansion would not require new lands or changes to existing zoning.
2.5	Use hazard lands or unstable lands subject to erosion?		X	The proposed landfill expansion would not require the use of hazard lands or unstable lands subject to erosion.
2.6	Cause negative effects related to the remediation of contaminated land?		X	The proposed landfill expansion would not cause negative effects related to the remediation of contaminated land.

Screening Criteria Checklist

	CRITERION MIGHT THE PROJECT…	YES	NO	ADDITIONAL INFORMATION
3. Air & Noise				
3.1	Cause negative effects on air quality due to emissions (for parameters such as temperature, thermal treatment exhaust flue gas volume, nitrogen dioxide, sulphur dioxide, residual oxygen, opacity, hydrogen chloride, suspended particulates, or other contaminants)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on air quality due to emissions.
3.2	Cause negative effects from the emission of greenhouse gases (e.g., carbon dioxide, carbon monoxide, methane)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in emission of greenhouse gases associated with continued operation of the Site.
3.3	Cause negative effects from the emission of dust or odour?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in dust and odour emissions associated with continued operation of the Site.
3.4	Cause negative effects from the emission of noise?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may result in a potential increase in noise emissions associated with continued operation of the Site.
3.5	Cause light pollution from trucks or other operational activities at the site?		X	The proposed landfill expansion would not cause negative effects from light pollution.

Screening Criteria Checklist

	CRITERION MIGHT THE PROJECT…	YES	NO	ADDITIONAL INFORMATION
4. Natural Environment				
4.1	Cause negative effects on rare (vulnerable), threatened or endangered species of flora or fauna or their habitat?		X	As there are no rare (vulnerable), threatened or endangered species of flora or fauna or their habitat on-site, the proposed expansion is not expected to cause a negative effect.
4.2	Cause negative effects on protected natural areas such as, ANSIs, ESAs, or other significant natural areas?		X	As there are no ANSIs, ESAs or other significant natural areas on-site, the proposed expansion is not expected to cause a negative effect.
4.3	Cause negative effects on designated wetlands?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on designated wetlands. It should be noted that none have been identified as being present on-site.
4.4	Cause negative effects on wildlife habitat, populations, corridors, or movement?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on wildlife habitats, populations, corridors, or movements. It should be noted that none have been identified as being present on-site.
4.5	Cause negative effects on fish or their habitat, spawning, movement, or environmental conditions (e.g., water temperature, turbidity, etc.)?		X	The proposed landfill expansion would not result in negative effects on fish or their habitat, spawning, movement, or environmental conditions (e.g., water temperature, turbidity, etc.) due to lack of presence on-site.
4.6	Cause negative effects on locally important or valued ecosystems or vegetation?		X	The proposed landfill expansion would not result in negative effects on locally important or valued ecosystems or vegetation.
4.7	Increase bird hazards within the area that could impact surrounding land uses (e.g., airports)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause an increase in bird hazards.

Screening Criteria Checklist

	CRITERION MIGHT THE PROJECT…	YES	NO	ADDITIONAL INFORMATION
5. Resources				
5.1	Result in practices inconsistent with waste studies and/or waste diversion targets (e.g., result in final disposal of materials subject to diversion programs)?		X	The proposed landfill expansion would be consistent with diversion targets.
5.2	Result in generation of energy that cannot be captured and utilized?		X	No energy recovery/ utilization is proposed.
5.3	Be located a distance from required infrastructure (such as availability to customers, markets, and other factors)?		X	The proposed landfill expansion would not change the existing landfill location.
5.4	Cause negative effects on the use of Canada Land Inventory Class 1-3, specialty crop or locally significant agricultural lands?		X	According to the Canada Land Inventory, lands within the Local Study Area (LSA) are comprised of Class 2 soils (generally north and west of the Site) and Class 3 soils (generally east and south of the Site). The proposed landfill expansion would not result in any loss of soil with agricultural capability, nor would the current expansion cause negative effects on Canada Land Inventory Class 2-3 soils within the LSA. All lands on the Site are considered to be disturbed and are not rated under the Canada Land Inventory.
5.5	Cause negative effects on existing agricultural production?		X	The proposed landfill expansion would not cause negative effects on agricultural production.

Screening Criteria Checklist

	CRITERION MIGHT THE PROJECT…	YES	NO	ADDITIONAL INFORMATION
6. Socio-Economic				
6.1	Cause negative effects on neighbourhood or community character?	X		The proposed landfill expansion would increase the footprint, landfill height in the expansion area and extend site operations and may cause negative effects to neighbourhood or community character.
6.2	Result in aesthetics impacts (e.g., visual and litter impacts)?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause aesthetic impacts due to the increase in landfill height in the expansion area.
6.3	Cause negative effects on local businesses, institutions, or public facilities?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on local businesses, institutions, or public facilities.
6.4	Cause negative effects on recreation, cottaging or tourism?		X	The proposed landfill expansion would not result in negative effects on recreation, cottaging or tourism.
6.5	Cause negative effects related to increases in the demands on community services and infrastructure?		X	The proposed landfill expansion would not cause negative effects related to increases in the demands on community services and infrastructure.
6.6	Cause negative effects on the economic base of a municipality or community?		X	The proposed landfill expansion would not cause negative effects on the economic base of a municipality or community.
6.7	Cause negative effects on local employment and labour supply?		X	The proposed landfill expansion would not cause negative effects on local employment and labour supply. The continued use of the road(s) will provide economic benefits to the local community in the form of new employment opportunities in both the construction and day-to-day operation. There is also the potential for increased employment opportunities in local firms.
6.8	Cause negative effects related to traffic?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects related to traffic through prolonging the life of the Site.
6.9	Be located within 8 km of an aerodrome/airport reference point?	X		A private airfield used for soaring is located approximately 7.5 km north of the Site.
6.10	Interfere with flight paths due to the construction of facilities with height (i.e., stacks)?		X	The proposed landfill expansion would not interfere with flight paths.
6.11	Cause negative effects on public health and safety?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on public health and safety.

Screening Criteria Checklist

	CRITERION MIGHT THE PROJECT…	YES	NO	ADDITIONAL INFORMATION
7. Heritage & Culture				
7.1	Cause negative effects on heritage buildings, structures or sites, archaeological sites or areas of archaeological importance, or cultural heritage landscapes?		X	The entire Site has been subjected to recent, extensive and intensive disturbance and it is therefore considered that the Site does not have any heritage, cultural and archaeological potential that will be negatively affected by the expansion. While there are areas within the LSA that may have heritage, cultural, and archaeological potential, these areas will not be disturbed by the proposed expansion.
7.2	Cause negative effects on scenic or aesthetically pleasing landscapes or views?	X		The proposed landfill expansion would result in changes to the existing landfill footprint, cover design (daily, intermediate, final), final contours, and on-site operations and may cause negative effects on scenic or aesthetically pleasing landscapes or views.
8. Aboriginal				
8.1	Cause negative effects on land, resources, traditional activities, or other interests of Aboriginal communities?		X	Consultation with Indigenous communities will take place throughout the Environmental Screening Process.
9. Other				
9.1	Result in the creation of non-hazardous waste materials requiring disposal?		X	The proposed landfill expansion would not change the types of wastes the facility is permitted to receive and would not result in the creation of non-hazardous waste materials requiring disposal (the landfill currently receives non-hazardous waste as permitted by the existing Environmental Compliance Approval).
9.2	Result in the creation of hazardous waste materials requiring disposal?		X	The proposed landfill expansion would not change the types of wastes the facility is permitted to receive and will would not result in the creation of hazardous waste materials requiring disposal (the landfill currently receives non-hazardous waste as permitted by the existing Environmental Compliance Approval).
9.3	Cause any other negative environmental effects not covered by the criteria outlined above?		X	The proposed landfill expansion would not cause any other negative environmental effects not covered by the criteria outlined above.

Next Steps

After this Public Open House, the following next steps in the Environmental Screening Process will be carried out by Brooks Road Environmental

- Determine the potential adverse environmental effects of the Project on the environment.
- If adverse environmental effects are identified, mitigation and monitoring measures will be applied to reduce or eliminate the effects.
- Prepare a Draft Environmental Screening Report which will document the Environmental Screening Process followed.
- Feedback received from members of the public, agencies, and Indigenous communities from this Public Open House and future consultation events will be considered prior to finalizing the Environmental Screening Report.
- There will be additional opportunities for consultation throughout the Screening process, including another Public Open House and review of the Environmental Screening Report.

Thank You

We appreciate your participation in the Environmental Screening Process and your attendance at today's Public Open House.

Comments Questions Suggestions

Vegetated screening berm (with fence)
Increase fence height as required for increased height of land fill
Start planting trees on berm for wind screening and visual appeal

Buffer area
Start planting permanent vegetation and trees if not already in progress

Proposed expansion and temporary fill storage.
The area along the north boundary and maybe other areas not visible from the road.
Plant cover crop, vegetation – better than weeds
May be an opportunity for farmers
Achieves dust, erosion and runoff control
Plant permanent vegetation and trees as slopes are completed

Dust control
Due to increased height of fill, use portable windscreens on hill tops as capacity expansion progresses.
Reference Stelco Nanticoke coal fields.

Storm water management pond
Plant native species typical of marsh
Improve filtering and subsequent run off water quality

Odour and gaseous emissions
Found answers to most of my concerns in the FAQ section:
Are smelly additions perfumed or are they treated?
Treat with "odour control product", hydrogen peroxide or some other oxidizer other than bleach?
Aerate or vacuum the build-up with underlayed temporary piping as it progresses?
Has a ground gas collection and treatment system been installed?
If not will it be installed as filling progresses?

Future use – toboggan hill!

Contents

Appendices

1. Introduction

This report summarizes the second Public Open House for the Brooks Road Landfill Capacity Expansion Environmental Screening held on October 24th, 2023. Brooks Road Environmental (BRE), owners and operators of the Brooks Road Landfill in Haldimand County, Ontario, have initiated an Environmental Screening process in accordance with Section 13 of the Waste Management Projects Regulation, (Ontario Regulation 101/07) of the Environmental Assessment Act (EA Act) for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic meters (m^3).

1.1 Objective for Open House

The main objectives of the second Open House included providing an overview of the Environmental Screening process; presenting a detailed project description; summarizing the results of the various environmental studies conducted for the Environmental Screening process, including potential effects, mitigation measures, overall net effects from the proposed expansion, and any monitoring requirements; and presenting the project schedule. The key information presented at the second Open House was the change in the planned capacity increase from the previously proposed 100,000 m^3 to 219,400 m^3as a result of the change in Ontario Regulation 101/07. The second Open House provided an opportunity to discuss and solicit feedback and comments on the proposed undertaking as well as how to best consult with the public going forward; meet the Project Team and ask questions regarding the undertaking and the EA process; and provide an update on Site developments occurring outside of the EA process.

Attendees were offered the opportunity to present their comments regarding the information directly to staff from BRE and GHD Limited (GHD).

1.2 Date, Time, and Location of Open House

The Public Open House was held on October 24, 2023, from 6 to 8 p.m. at the Cayuga Kinsmen Community Centre (15 Thorburn Street South, Cayuga, Ontario).

The second Open House followed the same drop-in format as the first Open House, with the information illustrated on a set of display panels arranged around the perimeter of the room. Project Team members were available to answer questions from attendees.

2. Notification

Notification of the second Public Open House was published in the Sachem online and Haldimand Press newspaper on October 12, 2023.

In addition to the newspaper advertisement, email notification of the second Public Open House was provided to the following identified agencies, Indigenous communities, and stakeholder groups on October 11, 2023.

- Haldimand County Mayor, Councillors, and relevant staff
- Grand River Conservation Authority
- Niagara Peninsula Conservation Authority
- Ministry of the Environment, Conservation & Parks (MECP)
- Ministry of Agriculture, Food and Rural Affairs
- Ministry of Heritage, Sport, Tourism and Cultural Industries

– Ministry of Education
– Ontario Provincial Police
– Grand Erie District School Board
– Ministry of Municipal Affairs – Ontario Growth Secretariat (formerly under the Ministry of Infrastructure)
– Ministry of Municipal Affairs and Housing
– Ministry of Northern Development, Mines, Natural Resources and Forestry
– Ministry of Transportation
– Métis Nation of Ontario (Head Office, Niagara Region Métis Council and Hamilton-Wentworth Métis Council)
– Six Nations of the Grand River First Nation
– Mississaugas of the Credit First Nation
– Haudenosaunee Confederacy Chiefs Council
– Haudenosaunee Development Institute
– Adjacent land owners and members of the public who had previously expressed an interest in the landfill

Moreover, notification was also provided to 2,019 addresses within the N0A postal code, covering the town of Cayuga, via unaddressed Canada Post mail-drop during the week of October 19, inviting interested stakeholders and members of the community to attend the event.

Copies of notification for the second Public Open House are provided in **Appendix A.**

3. Project Team Members in Attendance

The following Project Team members were in attendance at the Public Open House to answer questions:

Brooks Road Environmental	GHD
Tim Danyliw	Blair Shoniker Ryan Loveday Ben Kempel Matthew Griffin Katrina McCullough Amy Douglas Tochi Azubuike Michaela Watson

4. Information Presented

Information presented at the second Public Open House was in the form of display boards arranged around the room and organized to take the viewer through the process from project introduction to the history of the Site, Environmental Screening process, need/rationale, environmental study results, and next steps in the process. This information included:

– Outline of the purpose of the Open House
– Project Overview
– History of the existing landfill and Site

- Outline of the Environmental Screening process
- Rationale for the undertaking
- Proposed capacity expansion concept map
- Description of the Study Areas, including an aerial map
- Natural Environment Study Results including met effects and proposed mitigation measures.
- Groundwater and Hydrogeology Study Results including Net effects and proposed mitigation measures.
- Noise Study Results including met effects and proposed mitigation measures.
- Surface Water Study Results including met effects and proposed mitigation measures.
- Traffic Study Results including met effects and proposed mitigation measures.
- Land-Use & Socio-Economic Study Results including met effects and proposed mitigation measures.
- Air Quality Study Results including met effects and proposed mitigation measures.
- Next steps in the EA process

Copies of the display panels are included in **Appendix B**.

5. Attendance

A total of 12 individuals attended the second Open House on October 24, 2023. Those in attendance included local residents and landowners, local government officials, members of the Public Liaison Committee of the existing landfill, and a member of the media.

Comments ranged from apprehensive of the proposal to supportive. The majority of comments received during the second Open House related to the operations of the existing landfill. Landowners within the immediate vicinity of the Site asked questions regarding the potential height of the new expansion, wetland protection, visual impact, odour, noise, potential impacts to surface and groundwater, traffic, Site life, and post-closure use. Overall, there was good dialogue between attendees and staff.

Attendees were encouraged to provide written comments on the comment sheets provided. No comments were received.

All attendees who signed in were given the option to be added to the project-specific contact database if they had not already been added after the first Open House. This database will be used during the remaining phases of the Environmental Screening to contact and inform interested members of the public, Indigenous communities, and key stakeholders.

Local author finds his voice in "Bishop Rider" stories

By Ollvla Snyder
The Haldimand Press

CALEDONIA—Beau Johnson's latest book, *The Abrum Files*, is about legacy, both his own and his characters'.

Over the past seven years, Johnson has written and published three short story collections and three episodic novels, all centred around the character Bishop Rider. *The Abrum Files*, released Monday, October 9, 2023, explores Rider's stories from the perspective of Jeremiah Abrum, the son of the man who ruined Rider's life.

Johnson began reading and writing passionately when he was 15 years old. He had bought a Stephen King novel as a gift for his brother but read it himself instead and was captivated.

As life filled up with work, friends, and family, writing fell from Johnson's mind. For years, he was busy raising three boys and running the family business – Grand River Dinner Cruises in Caledonia – with his wife, Dana.

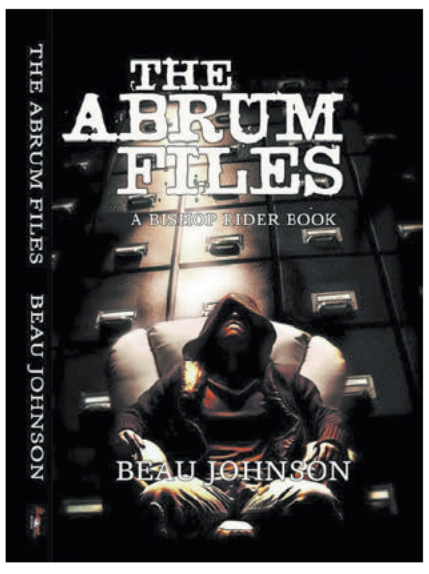
One evening in 2016 while the couple was watching "Mad Men", Beau suddenly turned to Dana and asked, "Why did I stop writing?" Johnson grinned while telling this story, saying, "That's the best thing about writing. There's no time limit, there's no age limit."

That conversation was the catalyst for seven years of developing a voice, getting to know new characters, and learning how to edit, publish, and market books.

Johnson "really found his voice" with Bishop Rider. The character was born out of necessity: Johnson wrote a story with a mother and daughter who were attacked, and they needed someone to avenge them. Rider, whom Johnson describes as a "punisher archetype", became that avenger.

The six Bishop Rider books centre on this mission of retribution. The series tagline, "It's not about saving people. It's about stopping them", illustrates Bishop's strategy and the storyline's "dark but never gratuitous" tone.

Rider's voice "has a cadence to it" that enlivens the character and action – at once dramatic, poetic, disjointed, and sharp. The narration shows how Rider delights in the rhythm of his words and the beauty of their sound, but also reveals



the harshness and agitation in his thoughts.

The Abrum Files introduces a new voice and a new challenge. Jeremiah Abrum's mission is similar to Rider's, but has a more redemptive arc. Abrum works to pay for his father's sins while Bishop strives to avenge the evil around him. The partnership transforms both characters' legacies.

This book, and an upcoming Bishop Rider anthology, have also given Johnson opportunities to grow in his writing process.

Johnson generally focuses more on ideas than structure. He explained, "If I get an idea I just go with it. I don't worry about plot. The first draft is raw, then I clean it up and take out the boring parts."

Next, Johnson's brother copy-edits the story. Finally, it is sent to Down and Out Books, Johnson's publisher, where the stories are sent back and forth several times between the editors and author before publication.

Johnson's non-linear process has caused some logistical challenges, but many more creative opportunities. Because Johnson "always write(s) out of sequence", he has had to "really focus on timeline" for each Bishop Rider book to ensure consistency and accuracy. However, the gaps and jumps leave room for different perspectives. While *The Abrum Files* tells Rider's story through another character's eyes, Johnson's next project, coming in 2024, will look through different author's eyes.

The upcoming anthology is a result of Johnson's personal marketing. Because Down and Out Books is an Indie publisher with limited advertising and distribution channels, their authors must promote their books in creative ways. Johnson focuses on Twitter, TikTok, and Instagram. A Twitter follower asked if Johnson had ever thought about compiling Bishop Rider stories from other authors, and Johnson loved the idea.

He issued a call on social media asking for 50 stories: "Some were really, really bad, some were ok, and a few were really, really good."

After reviewing the submissions, Johnson realized there was a lack of female perspective, so he issued another call specifically for women to submit. The new anthology will have a mix of voices and perspectives to showcase the crime and vengeance genre.

Johnson is passionate about marketing not only his own books, but other up-and-coming authors. Social media posts he calls "Beau's Book Nook" feature his own stories, while "Not Beau's Book Nook" features other authors he enjoys. Local readers can learn more about Johnson and his recommendations on his social media: beaujustinjohnson on Instagram and beaujohnson44 on Twitter.

Cayuga Heritage Centre unveils 'fragile' new exhibit and upcoming October program schedule

To The Haldimand Press

CAYUGA—The Cayuga Heritage Centre is pleased to announce the launch of its newest exhibition, 'Handle With Care', along with its October program schedule.

The events kicked off with an exhibition talk this week, where the museum curator taught participants about the history of fragile, useful objects that we use in our daily lives and the process of setting up and caring for the precious items in Haldimand Museums' collection – including 19th century ceramics, pottery, earthenware, and porcelain. The exhibit remains open for visitors to peruse. Upcoming events include:

Workshop: Preserving Your Family Photographs – October 21

Participants in this hands-on preservation workshop will learn how to keep their cherished family photographs intact for future generations. The workshop will include a discussion on the history of photography and how to identify vulnerabilities and apply preventive care techniques like an archivist! Feel free to bring photos along for consultation at the end of the session. The workshop will run from 11 a.m. to 1 p.m. and take place in the Cayuga Heritage Centre's Archive Room.

Community Voices Participatory Presentation and Community Paramedic Program K9 Visit – October 25

Join other history enthusiasts for a presentation exploring lesser-known families that have had roots in Haldimand County from time immemorial. Attendees will also have an opportunity to learn about the genealogical research process and have a visit with our local emergency services' wellness dogs. This program will run from 1 to 3 p.m. in the Cayuga Heritage Centre programming room. Please note that a trained emergency services dog will be in the building.

Cemetery Walk – October 28

Discover the history and secrets of the Caledonia Methodist Cemetery on a guided walking tour. Learn about headstone symbiology and local family histories. There are two timeslots available: 10:30 a.m. to 12 p.m. or 1 to 2:30 p.m.

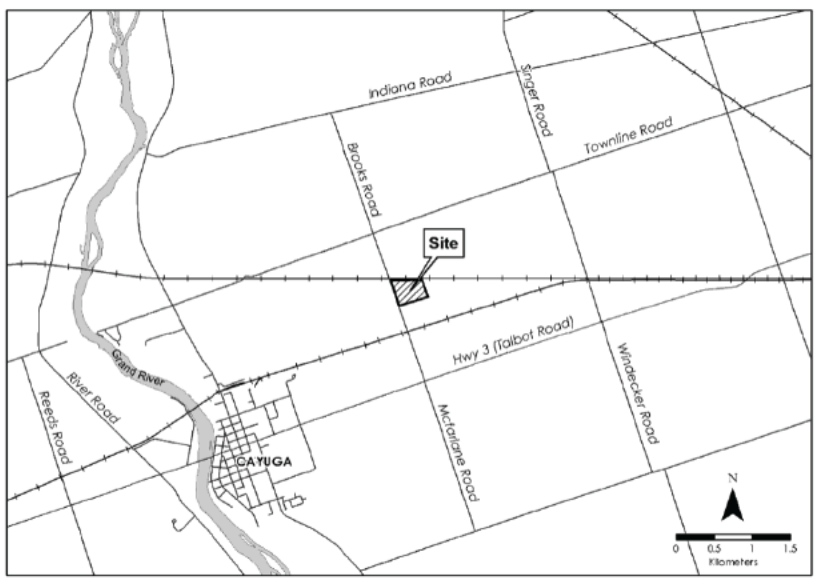
The cost for each program is $10/person unless otherwise specified. Pre-registration is required for all events. Register online at link.haldimandcounty.ca or in person at the Haldimand County Administration Building at 53 Thorburn Street South, Cayuga.

Notice of Public Open House 2 – Brooks Road Landfill Capacity Expansion

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects Regulation of the *Ontario Environmental Assessment Act (EA Act)* for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic metres (including waste and daily/final cover). This capacity increase is a change from the previously proposed increase of 100,000 cubic metres due to a change in O. Reg 101/07.

The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste. The proposed capacity expansion will add capacity equal to approximately two additional years of waste acceptance over and above the remaining/ current approved capacity. There are no changes to the annual fill rate limits proposed as part of this project.

The location of the Brooks Road Landfill Site is shown on the map below. The purpose of the Environmental Screening is to study the potential effects of the capacity expansion on the environment.



The Process

As described above, the proposed project is subject to the Ministry of the Environment, Conservation and Parks (MECP) Environmental Screening Process for waste management projects in accordance with O. Reg. 101/07 under the *EA Act.* The Environmental Screening will be conducted in accordance with the planning and design process outlined in the Ontario MECP's "Guide to Environmental Assessment Requirements for Waste Management Projects." The Environmental Screening Process includes identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects. The results of the Study will be documented in an Environmental Screening Report, which will be released for review to the public, Indigenous communities, and government agencies.

Consultation and Public Open House #2

Members of the public, Indigenous communities, agencies, and other interested persons are encouraged to actively participate in the planning process by attending consultation events or contacting Project Team staff directly with questions. Consultation activities are planned throughout the Environmental Screening Process and will be advertised via direct and/or electronic mail, in the local newspaper, and on the project website (www.brenvironmental.com).

The second **Public Open House** to present the results of the Environmental Studies is scheduled for **October 24, 2023**. The details of the Public Open House are as follows:

Date: Tuesday, October 24, 2023 Drop-In Time: 6 p.m. to 8 p.m.
Location: Cayuga Kinsmen Community Centre – 15 Thorburn Street South, Cayuga

You are encouraged to attend the Public Open House and to submit your comments via the project website (www.brenvironmental.com), mail, email or telephone to the addresses/numbers below.

If you would like to be added to our project mailing list or have project-related questions, please contact:

HALDIMAND COUNTY PUBLIC NOTICES

Notice of Public Open House 2 - Brooks Road Landfill Capacity Expansion

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects Regulation of the Ontario Environmental Assessment Act (EA Act) for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic metres (including waste and daily/final cover). This capacity increase is a change from the previously proposed increase of 100,000 cubic metres due to a change in O. Reg 101/07.

Dear Government Review Team Members,

I writing to inform you that Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act* for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario.

The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic metres (including waste and daily/final cover). This capacity increase is a change from the previously proposed increase of 100,000 cubic metres due to a change in O. Reg 101/07.

You are invited to join the second public open house being held on Tuesday, October 24th at the Cayuga Kinsmen Community Centre. More information is included in the enclosed notice. You are welcome to drop in anytime between 6:00 and 8:00 p.m. to learn more about the preliminary results of the environmental and technical studies being undertaken as part of the Environmental Screening process.

We will continue to notify you about this Environmental Screening unless we hear from you stating that you do not wish to be consulted on this undertaking. For further information on the proposed study, please feel free to contact me and visit https://www.brenvironmental.com/ for further details to be posted throughout the process.

Kind Regards,

Axita Patel
Solid Waste Planner

Public Open House No.2

Brooks Road Landfill Capacity Expansion Environmental Screening

Purpose of the Open House

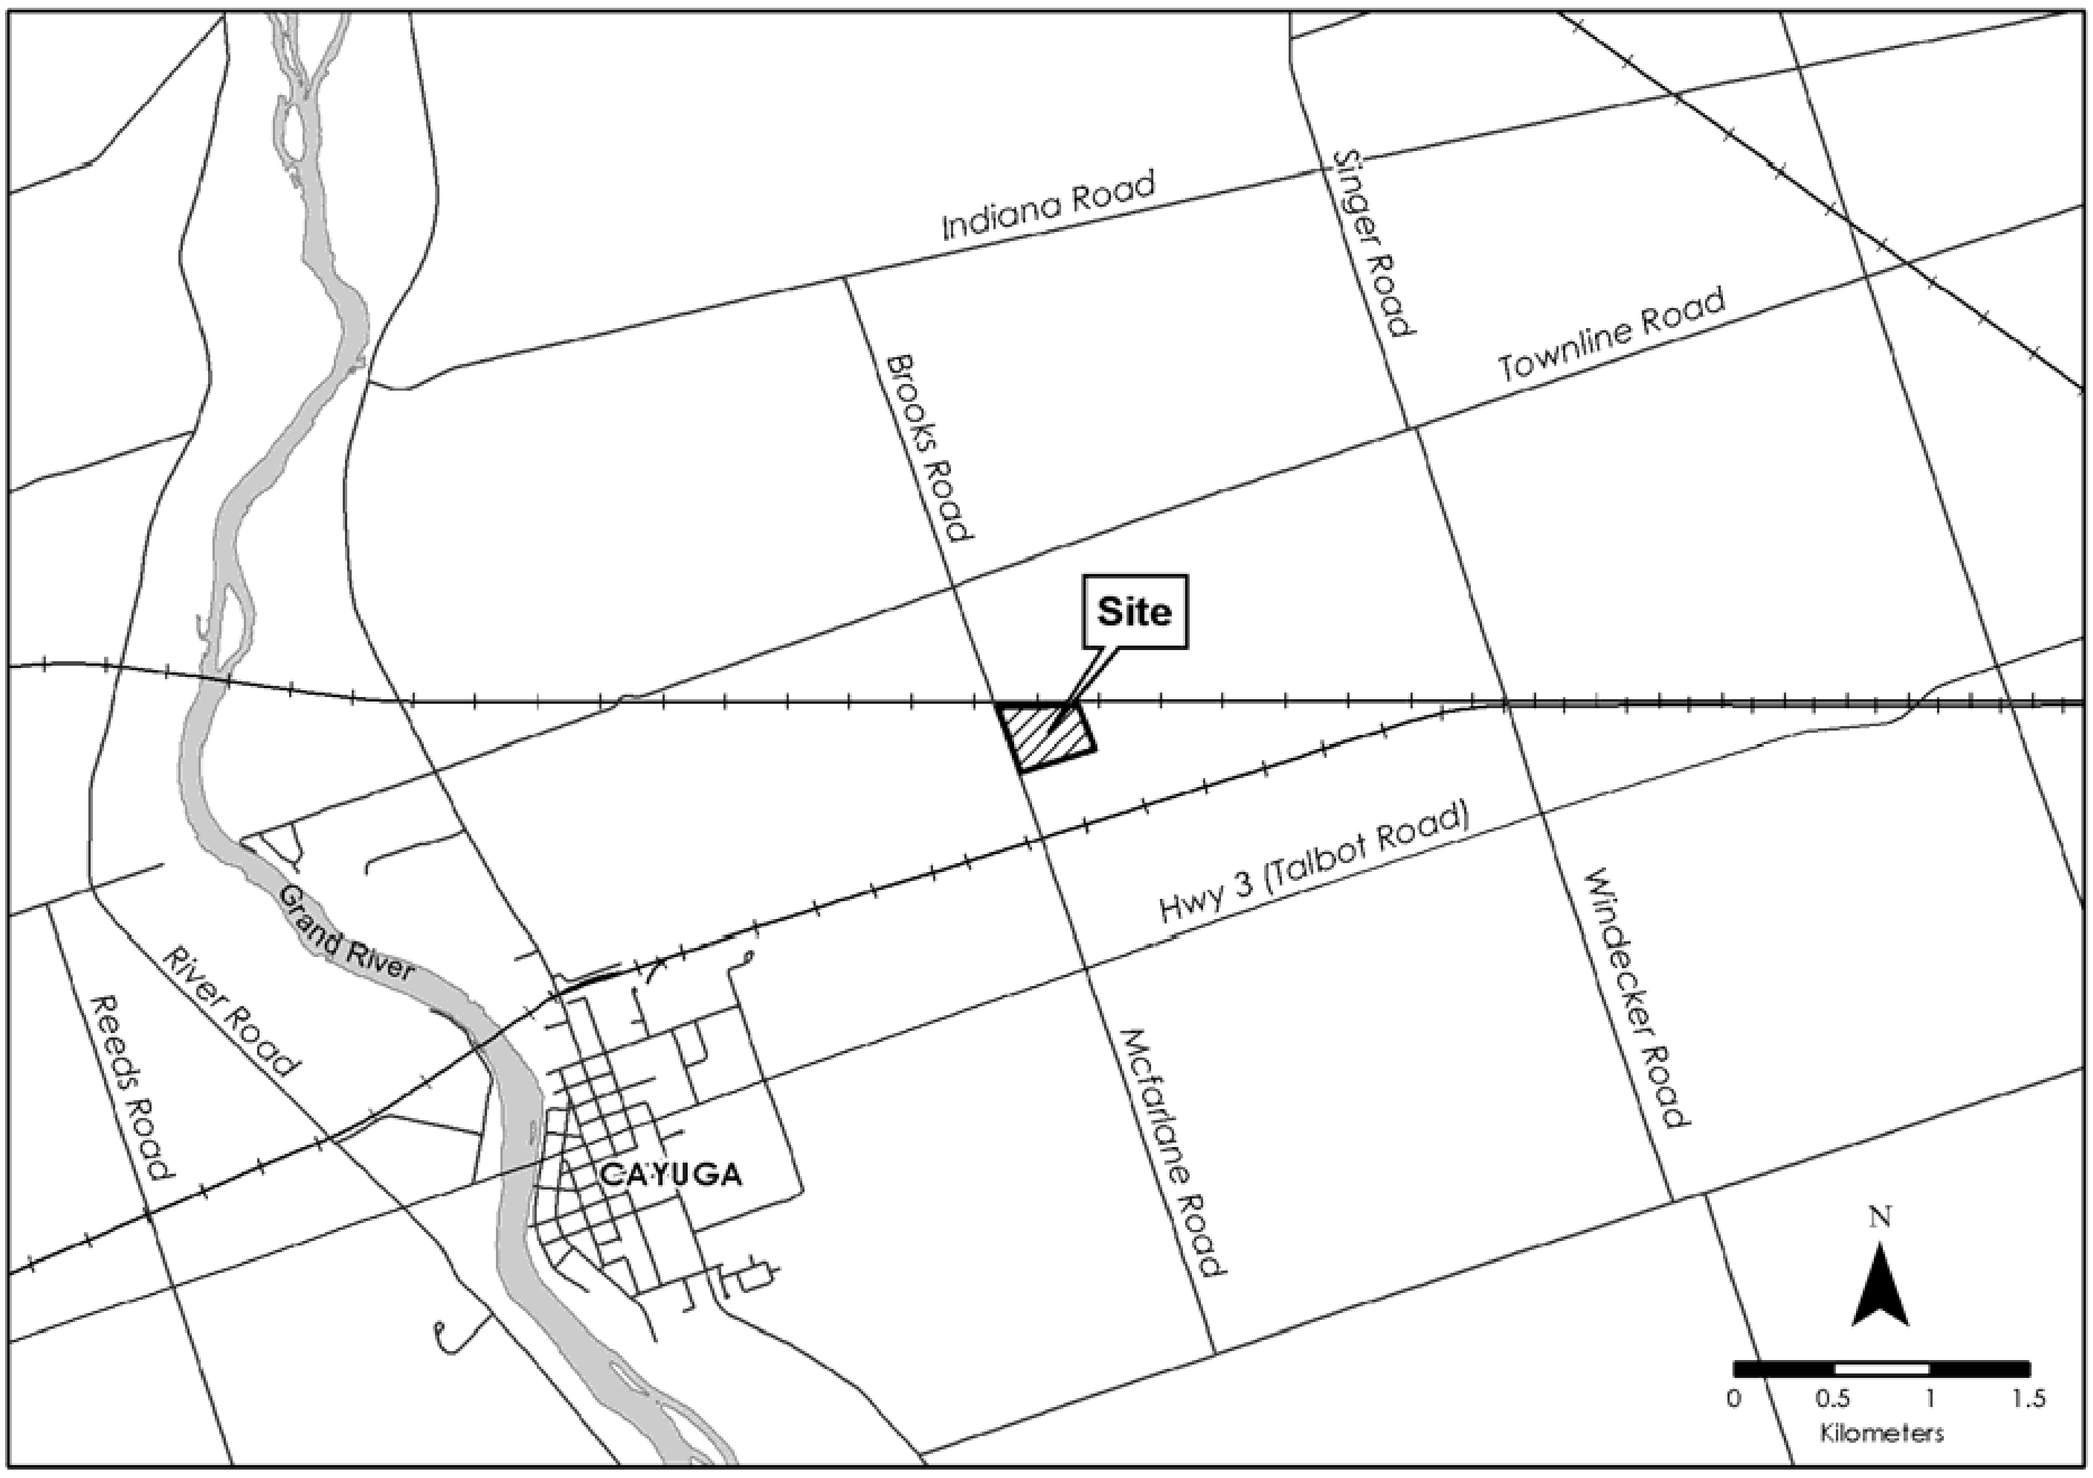
The purpose of this Public Open House is to share information about the Environmental Screening for the proposed Brooks Road Landfill Capacity Expansion and to obtain your comments for consideration by Brooks Road Environmental.

This Open House will:

- Describe the purpose of the proposed Capacity Expansion
- Introduce Brooks Road Environmental
- Outline the Environmental Screening Process
- Summarize the Problem/Opportunity and Project Description
- Present the Environmental Study Results
- Identify next steps in the Environmental Screening Process

Project Overview

Brooks Road Environmental has initiated an Environmental Screening Process for a proposed capacity expansion of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario, shown on the Site map below.



- The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic metres. This capacity increase is a change from the previously proposed increase of 100,000 cubic metres due to a change in Ontario Regulation 101/07.
- The proposed capacity expansion will add capacity equal to approximately two additional years of waste over and above the remaining/ current approved capacity.

Brooks Road Environmental

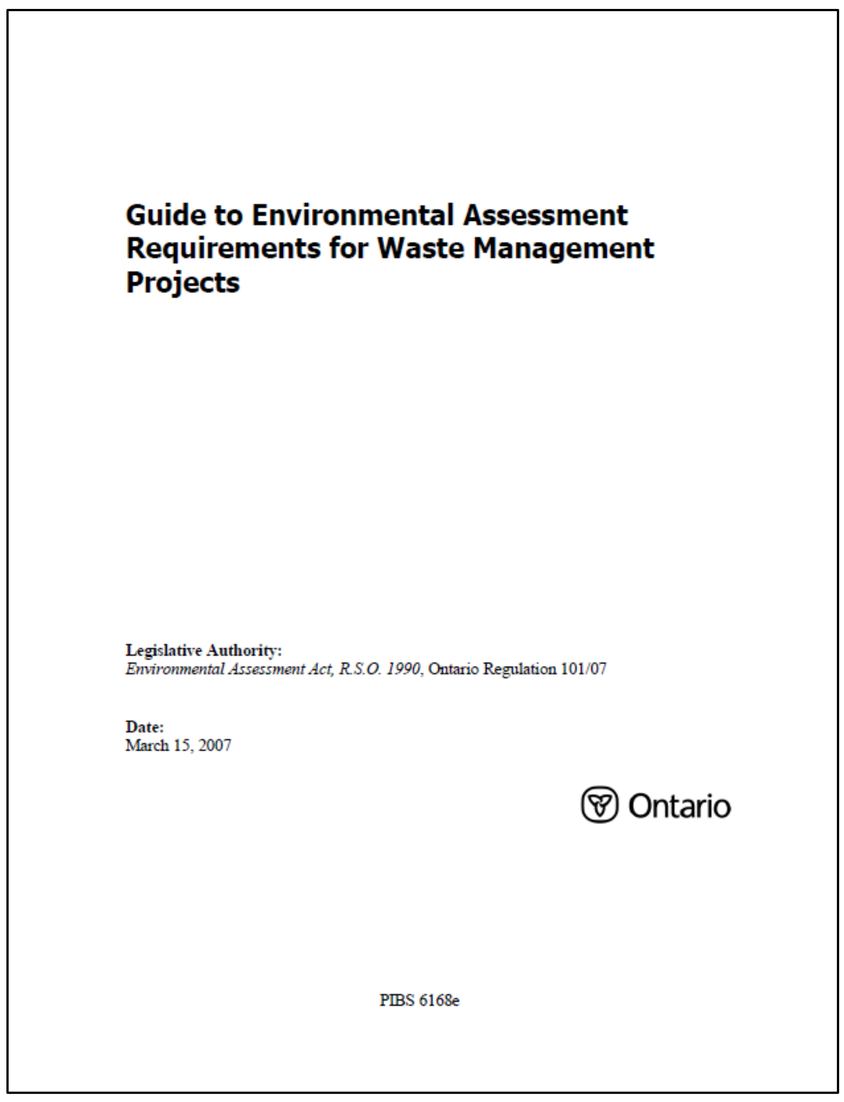
Brooks Road Landfill is a 100% Canadian owned and managed, sustainable landfill, serving waste generators in Southwestern Ontario.

- Brooks Road Environmental is committed to providing cost-effective and environmentally-sound disposal for solid waste, including impacted soils, generated by industries and businesses.
- With a capacity of 1,000 tonnes per day, Brooks Road Landfill can meet the waste disposal needs of Ontario businesses while protecting our surrounding environment.
- BRE has been working with Haldimand County to help with their challenges of disposing of their excess soils and street sweepings
- The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste.

Environmental Screening Process

An Environmental Screening Process is an approvals process for projects that have predictable environmental effects that can be readily mitigated.

- This Project is subject to an Environmental Screening Process in accordance with Section 13 of the Waste Management Projects Regulation, (Ontario Regulation 101/07) of the *Environmental Assessment Act.*
- The Ministry amended O. Reg. 101/07 in August 2023. This change allows a landfill to increase the total waste disposal volume by 375,000 m³ (vs 100,000 m³) using a streamlined EA process if the total approved volume is not increased by more than 25%.
- The Project will be conducted in accordance with the Ministry of Environment, Conservation, and Parks “Guide to Environmental Assessment Requirements for Waste Management Projects”.
- Results of the Environmental Screening will be documented in an Environmental Screening Report, which will be released for public and agency review.



Guide to Environmental Assessment Requirements for Waste Management Projects

ONTARIO REGULATION 101/07
WASTE MANAGEMENT PROJECTS

Consolidation Period: From July 1, 2021 to the e-Laws currency date.

Last amendment: 277/21.

Legislative History: 361/09, 250/11, 129/14, 277/21.

This Regulation is made in English only.

CONTENTS

Environmental Screening Process

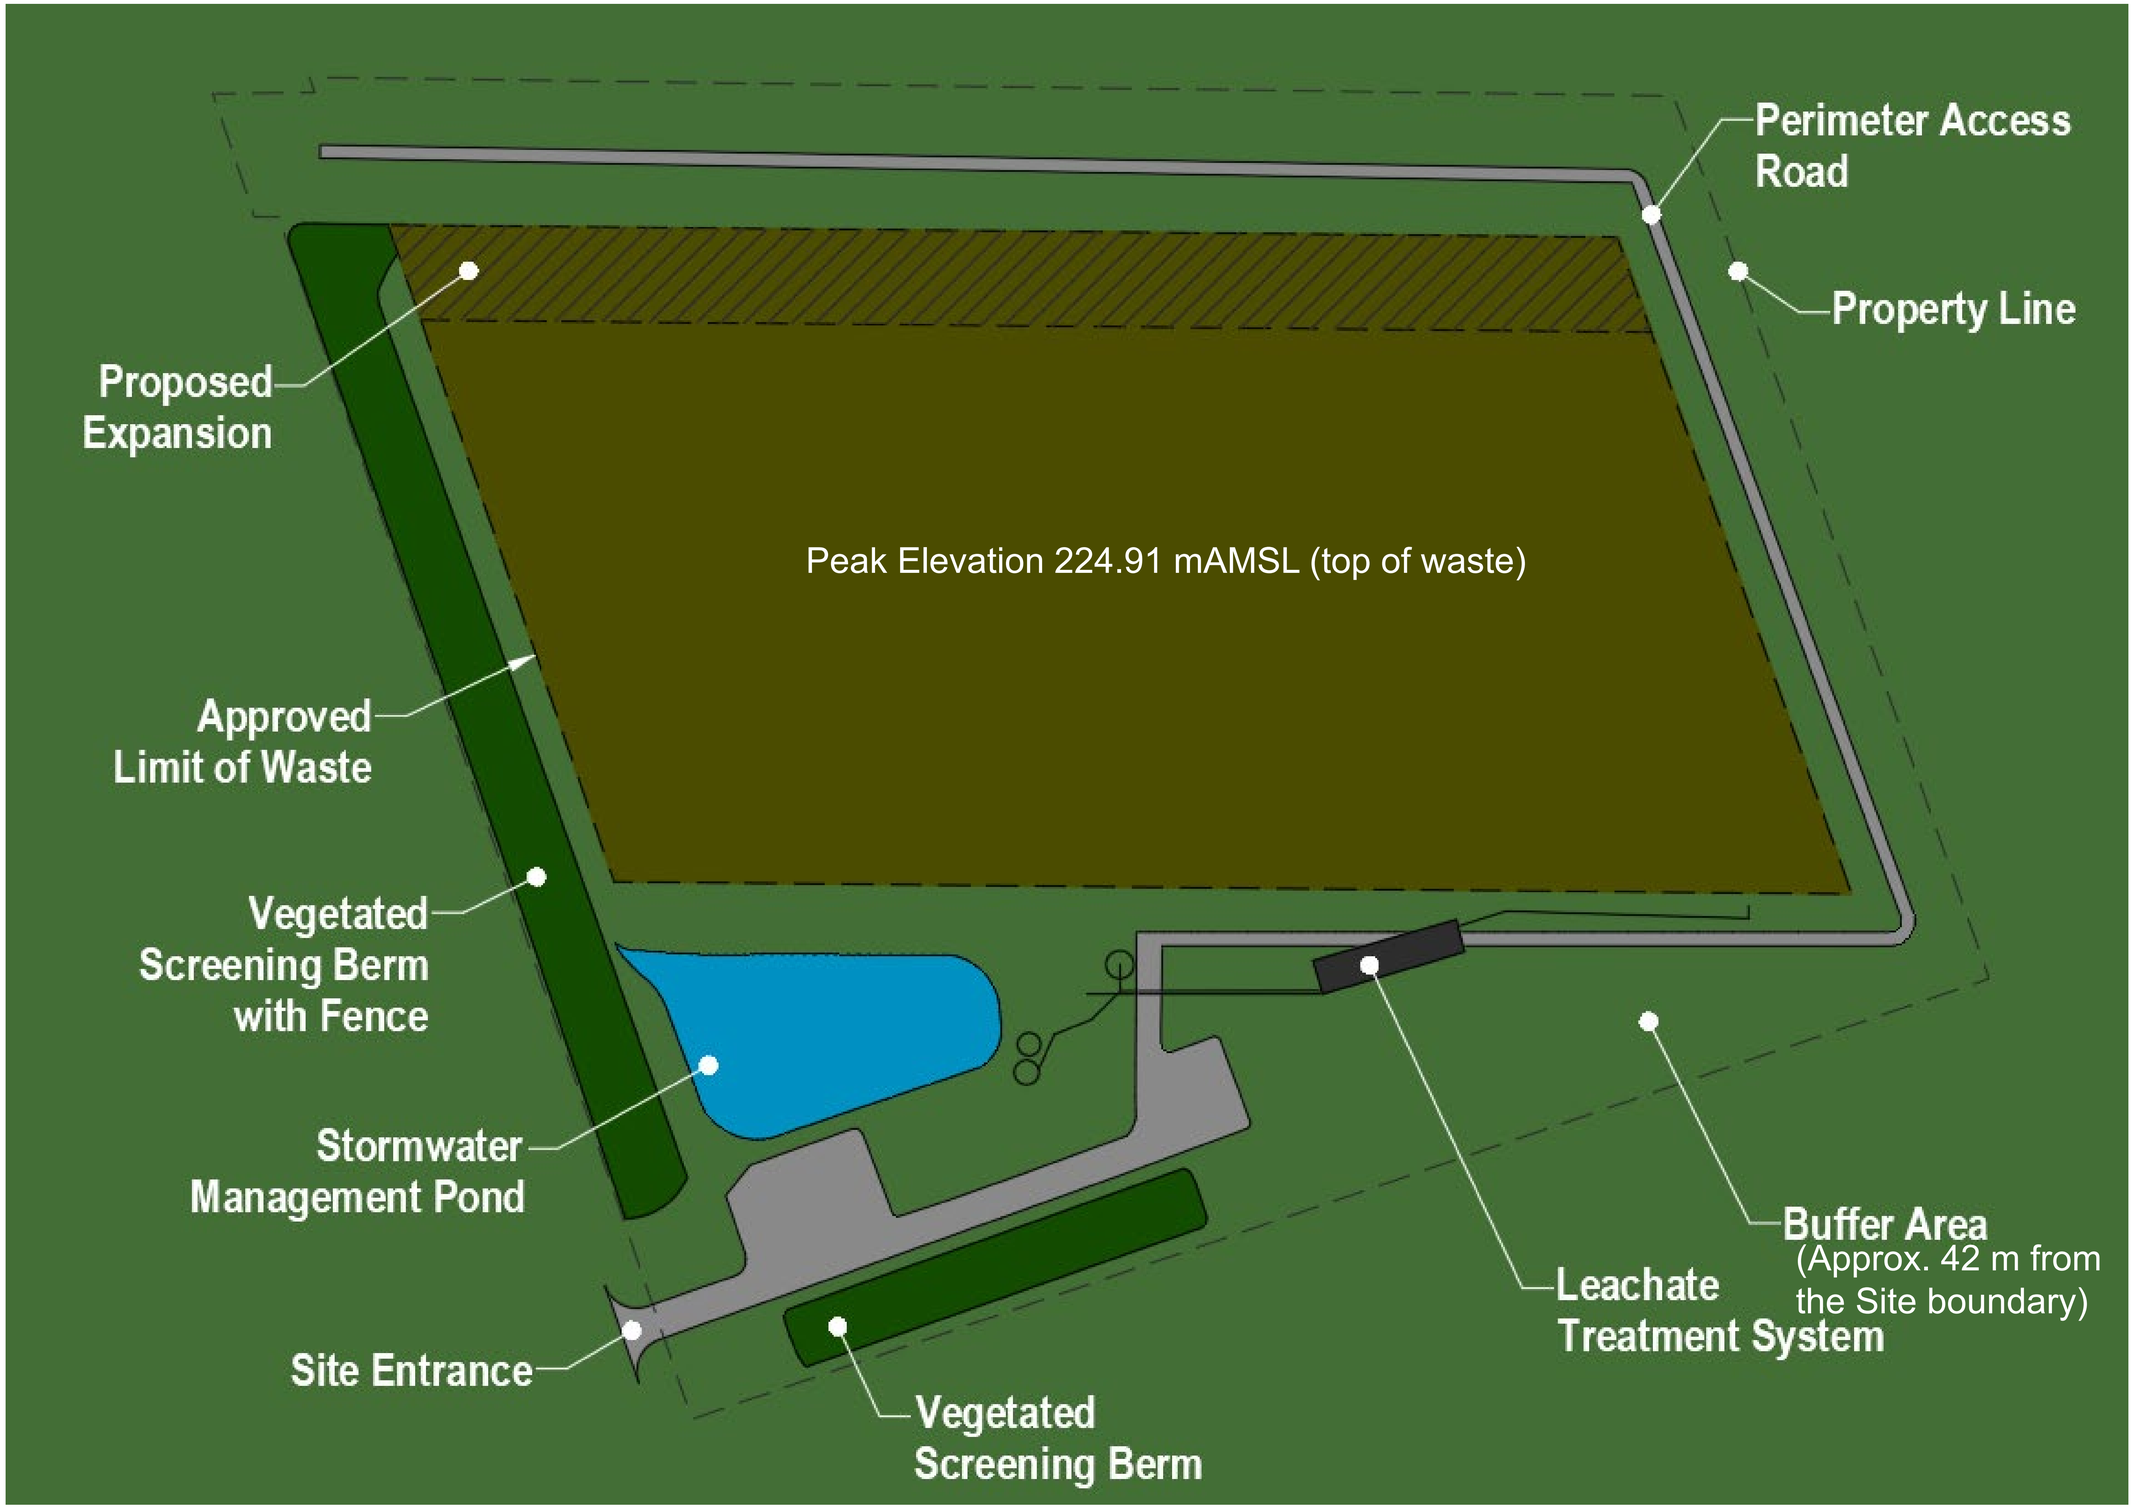
This Public Open House is an important part of the Environmental Screening Process to consult and engage with stakeholders in the process (Steps 6 – 8).

Step 1	Publish Notice of Commencement and Public Open House
Step 2	Identify Problem or Opportunity and Project Description
Step 3	Apply Screening Criteria
Step 4	Describe Potential Environmental Effects, Concerns, and Issues
Step 5	Consultation and Public Open House #1
Step 6	Conduct Studies and Assessment of Potential Environmental Effects
Step 7	Develop Impact Management/ Mitigation Measures
Step 8	Consultation and Public Open House #2
Step 9	Identify Significant Net Effects and Resolve Concerns (if required)
Step 10	Conduct Additional Studies and Assessment (if required)
Step 11	Prepare Environmental Screening Report
Step 12	Publish Notice of Completion
Step 13	Resolve Elevation Requests (if required)
Step 14	Submit Statement of Completion to the Ministry of the Environment, Conservation and Parks

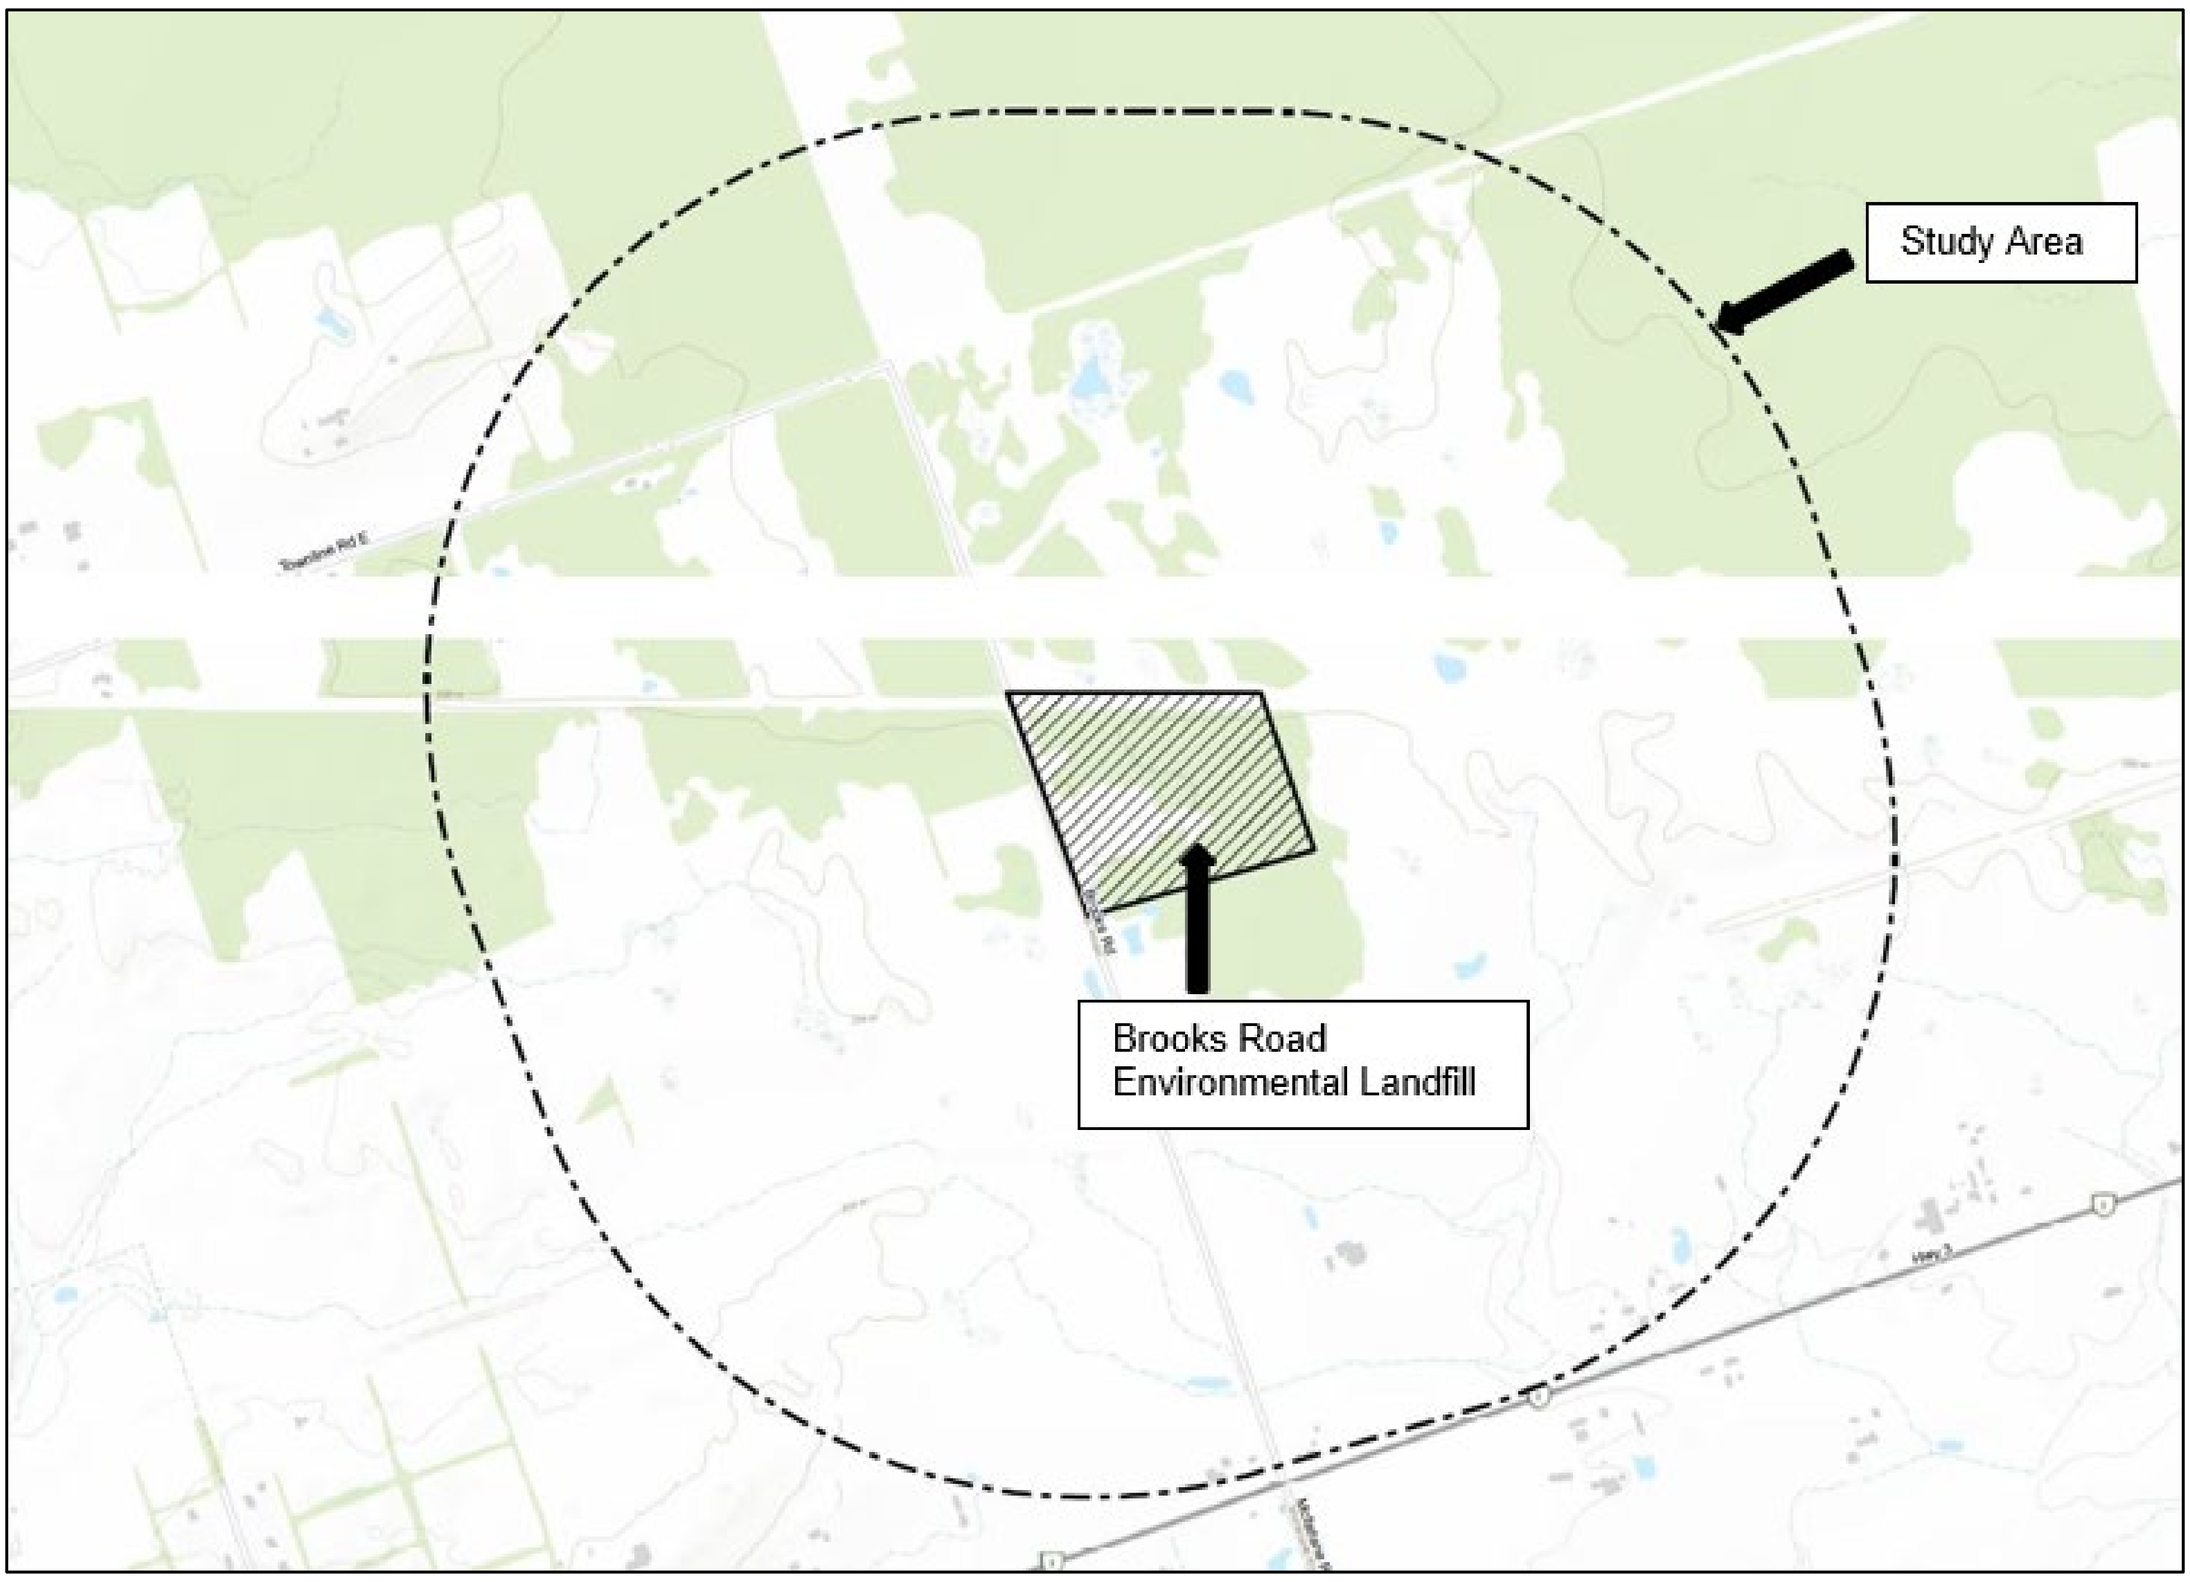
Problem / Opportunity & Project Description

- There is an opportunity to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post diversion solid non-hazardous Industrial, Commercial & Institutional waste (including impacted soils).
- The proposed expansion would increase the capacity of the Site by approximately 219,400 m³, adding capacity equal to approximately two additional years.
- This would be achieved through a combination of re-engineering the Site's final contours to expand the Site vertically, as well as increasing the existing landfill footprint to expand the Site horizontally to the north.
- Modification to the northern perimeter access road and stormwater drainage ditch would be required to accommodate the proposed changes to the final Site contours.
- The former railway property to the north would continue to provide buffer land for the Site.
- Buffer lands to the east, south, and west will be maintained as currently approved.

Proposed Capacity Expansion Concept



Environmental Screening – Study Results



The Environmental Screening Process evaluated aspects of the environment that could be affected by the proposed expansion. The areas of study include:

- Natural Environment
- Geology and Hydrogeology
- Noise
- Surface Water
- Transportation
- Land Use and Socio-Economic
- Air Quality

The studies evaluated potential effects and recommended mitigation measures where effects were identified. Each study:

- Confirmed the study boundary and time frames.
- Collected and analyzed data to assess potential effects.
- Identified mitigation measures and monitoring programs to determine Net Effects and documented the findings by discipline.

Study Results: Natural Environment

The net effects are anticipated to be negligible as all the mitigation measures are already in place.

- No clearing of the vegetation will be conducted outside of the Site boundary.
- Silt fencing is installed to prevent migration of sediments into the wetland.
- Existing chainlink and wildlife exclusion fence prevent wildlife from entering the Site.
- The proposed expansion is confined to the existing Site boundary.

Monitoring

- Annual monitoring of calling amphibians.
- Quarterly monitoring for surface water quality and flow.
- Quarterly inspections of the silt and wildlife fencing.

Study Results: Groundwater & Hydrogeology

The net effects are anticipated to be negligible as the mitigation measures are already in place.

- Continue implementation of these engineered controls:
  - Final cover system
  - Leachate collection and treatment system (The existing leachate treatment system is sized to manage and treat leachate from the proposed expansion)
  - The liner system
- The Site is also situated within a clay-rich stratigraphic sequence with significant vertical thickness. This natural feature provides additional protection of the underlying aquifer as well as some beneficial attenuation capacity.

Monitoring

Continuation of a comprehensive leachate and groundwater monitoring program.

Study Results: Noise

The overall net effects of the proposed expansion are negligible.

- The predicted off-Site noise impact meets the applicable regulatory noise limit.
- Regular equipment inspections and maintenance procedures are in place and are to be continued.
- Best Practices and control measures for landfill activities in place and to be continued.

Monitoring

- No monitoring requirements are needed for ongoing noise compliance.

Study Results: Surface Water

Net effects on surface water quality, quantity, and flow rate are minimal.

- The proposed expansion of the landfill will slightly increase the total contributing drainage areas to the existing Stormwater Water Management Pond (SWM).
- Continuous operation of the existing stormwater controls on-Site including drainage ditches and the SWM.
- Establish good vegetative coverage in the expanded areas to reduce erosion and maintain existing hydrologic conditions.

Monitoring

- Quarterly grab samples from the monitoring locations.
- Laboratory analysis of grab samples.
- Annual monitoring reports.

Study Results: Transportation

The proposed capacity expansion will have negligible transportation effects.

- Truck traffic associated with the proposed capacity expansion will not contribute any additional traffic within the study area due to maintaining the maximum approved fill rates.
- With no additional truck traffic generated by the proposed capacity expansion, no mitigation measures are recommended in order to avoid or minimize impacts on Transportation.

Monitoring

- No further monitoring of the transportation effects is recommended.

Study Results: Land Use & Socio-Economic

The net effects are negligible from a land-use and socio-economic perspective.

- No potential impacts are expected for incompatibility with planning and by-law governing documents for the land.
- Operation of the landfill will not affect land uses within 500 m as all operations take place within Site boundaries.
- No potential impacts are expected for community character, as the Site is already zoned as “Disposal Industrial”.
- No negative impacts on recreation, tourism, and aesthetics of the area.
- Predicted positive financial impacts to the area (economic base, local employment, and labour supply).
- Best management practices will be implemented to manage dust and odour.

Study Results: Air Quality

No change to the net effects from the existing landfill operation is anticipated as a result of the proposed capacity change, based on the continued implementation of the mitigation measures.

- Negligible effects on odour as the estimated landfill gas production for the Site is extremely small and is not expected to result in any off-Site odour impacts.
- Negligible effects on air quality based on air modeling as all particulate matter fractions are well below the MECP ambient air quality criteria (AAQC).
- Standard Operating Procedures (SOPs) in place for odour and dust management and operation of a leachate treatment system.

Next Steps

After this Public Open House, the following next steps in the Environmental Screening Process will be carried out by Brooks Road Environmental

- Prepare a Draft Environmental Screening Report which will document the Environmental Screening Process followed.
- Feedback received from members of the public, agencies, and Indigenous communities from this Public Open House and future consultation events will be considered prior to finalizing the Environmental Screening Report.
- The Draft Environmental Screening Report will be available for review.

Thank You

We appreciate your participation in the Environmental Screening Process and your attendance at today's Public Open House.

Dear Government Review Team member,

On behalf of Brooks Road Environmental, a draft Environmental Screening Report (ESR) was prepared as part of the Brooks Road Landfill Expansion EA for your review. Please use this link to view and download the ESR: https://acrobat.adobe.com/link/track?uri=urn:aaid:scds:US:3d1c0177-04c2-4429-bc03-e24bdcab9d39

We are requesting that your written comments be received by no later than **February 5, 2024,** so they can be considered as part of preparing the Final ESR.

Should you determine that your agency/ministry does not wish to be involved in this EA, please let me know and I will remove your name from the contact list.

Please feel free to reach out for any questions and please respond to this email address with any formal comments on the draft ESR.

Kind Regards,
Axita

---

Dear Government Review Team Members,

I writing to inform you that Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act* for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario.

The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic metres (including waste and daily/final cover). This capacity increase is a change from the previously proposed increase of 100,000 cubic metres due to a change in O. Reg 101/07.

You are invited to join the second public open house being held on Tuesday, October 24th at the Cayuga Kinsmen Community Centre. More information is included in the enclosed notice. You are welcome to drop in anytime between 6:00 and 8:00 p.m. to learn more about the preliminary results of the environmental and technical studies being undertaken as part of the Environmental Screening process.

We will continue to notify you about this Environmental Screening unless we hear from you stating that you do not wish to be consulted on this undertaking. For further information on the proposed study, please feel free to contact me and visit https://www.brenvironmental.com/ for further details to be posted throughout the process.

Kind Regards,

Axita Patel

Subject: RE: Regional EA Coordinator Inquiry

Hi Sherry,

That list is correct. The only correction would be that Mississauga of the New Credit First Nation dropped the word NEW a few years ago, they now go by Mississauga of the Credit First Nation.

HDI represents HCCC, you can provide the same correspondence to both communities.

Good afternoon Joan,

We are commencing an Environmental Screening Process for an expansion at the Brooks Road Landfill Site, 160 Brooks Road, near Cayuga, Haldimand County, Ontario (please refer to the map attached to this email) and would like to ask for the Ministry of Environment, Conservation and Parks to please confirm the following list of Indigenous communities to be consulted within our Study Area:

- Mississauga of the New Credit First Nation
- Métis Nation of Ontario
- Six Nations of the Grand River First Nation
- Haudenosaunee Development Institute (HDI)
- Haudenosaunee Confederacy Chiefs Council (HCCC)

Also, would you be able to confirm whether HCCC and HDI should contacted concurrently within the same correspondence?

Warmly,

Sherry Leslie

---

Thanks Erika – no need to include the general GRCA planning email. Also, wondering if any of the public engagement materials from the open house will be posted on Brooks Road's document library either before or after the session. Not sure if I'll be able to make the session, and they'd also be helpful for circulating our Natural Heritage staff. Let me know if you can.

Cheers,

Will

Good morning Erika,

My name is Rod LeClair and I'm with the OPP Provincial Liaison Team. Our role is to maintain open lines of communication with groups who may be affected by major events such as protests or demonstrations. I'm not sure if you're familiar with our team or not.

We are aware of the Brooks Road Landfill Capacity Expansion project in Cayuga that is currently at the environmental screening process stage.

I have been checking your website for information.

We would like to attend any meetings in the future about this project if you would be so kind to add me to your distribution list.

Thank you Erika.

Good afternoon Rod,

Yes, we can certainly add Lindsay as well.

We currently have the following three individuals listed for OPP on our Government Review Team for the Brooks Road Environmental Screening:

Jennifer Davey
Administrative Assistant Research and Program Evaluation Unit /
Research Planning & Analysis Section
Ontario Provincial Police
Phil Carter
Inspector
Detachment Commander
Ontario Provincial Police
Haldimand County
Belinda Rose
S/Sgt.
Operations Manager
Ontario Provincial Police
Haldimand County

Should we replace any of these names with yourself/Lindsay?

Thank you,
Erika

---

Good Afternoon Chief Laforme,

Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have initiated an Environmental Screening Process in accordance with Ontario Regulation (O. Reg.) 101/07 – Waste Management Projects Regulation of the Ontario *Environmental Assessment Act* (*EA Act*) for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill located at 160 Brooks Road, near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 100,000 cubic metres (including waste and daily/final cover).

Please find attached a copy of the Notice of Commencement of an Environmental Screening and Public Open House, Draft Project Description, and Screening Criteria Checklist. On behalf of Brooks Road Environmental, GHD will reach out early next week to offer additional details on the undertaking, as well as to determine if you would like to set-up a separate meeting to review the proposed project in greater detail and discuss your preferred approach to future engagement.

We will continue to notify you about this Environmental Screening. For further information on the proposed study, please feel free to contact the undersigned and visit https://www.brenvironmental.com/ for further details to be posted throughout the process.

Kind Regards,
Erika Brown

Good afternoon Abby,

I hope you are enjoying the last few weeks of the summer!

I am writing in follow up to our meeting of July 19 to provide the requested Archaeology & Cultural

Heritage Report from the previous Brooks Road Landfill Vertical Capacity Expansion Individual Environmental Assessment (approved January 2019). I have also included the Ministry of Tourism, Culture & Sport reviewer comments on the Environmental Assessment Report (to which the Archaeology & Cultural Heritage Report was appended) for your records.

Thank you again for the discussion on July 19. We will continue to notify you about this Environmental Screening and please reach out if you have any other questions.

Kind Regards,
Erika

Good Morning Erika,

My name is Abby LaForme, the Acting Consultation Coordinator for the Mississaugas of the Credit First Nation (MCFN), Department of Consultation and Accommodation (DOCA). I have been with MCFN DOCA for the last 3 years and have worked closely with Fawn Sault. So with that, I am very familiar with the consultation process.

Thank you for reaching out to MCFN DOCA. There have been a few staffing changes within our department so thank you for your patience.
Adam LaForme is our Archaeological Operations Supervisor, so if you have any Archaeological inquiries please feel free to reach out and contact him directly at Adam.LaForme@mncfn.ca

I have reviewed the attached *Screening Criteria Checklist Brooks Road Landfill Capacity Expansion Environmental Screening,* in the Natural Environment Section I noticed the proponent checked yes to this project causing a negative effect on wildlife habitat

populations, corridors, or movement. What steps are being taken to fix the negative effects?

Thank you

Abby LaForme,
Acting Consultation Coordinator

Brooks Road PLC Meeting Minutes

November 03, 2022

Project name	Brooks Road Landfill	**From**	Blair Shoniker
Subject	2022 Brooks Road PLC #2	**Tel**	+1 905 429-5040
Date/Time	June 1, 2022/7:00pm-8:00pm	**Project no.**	018235
Attendees	Katrina McCullough (KM) – GHD Blair Shoniker (BS) – GHD Ryan Loveday (RL) – GHD Tim Danyliw (TD) – BRE Chris O'Connor (CO) – MECP Hamilton District Dave Bruce (DB) - PLC Member, Chair John Metcalfe (JM) – PLC Member, Councillor Diane Manto (DM) – Public (departed at 7:35) Laurie Woolner (LW) – Public Rudi Horvat (RH) – Public	**Copy to:**	All Attendees

Minutes	Action
Approvals	– BS reviewed Site approvals. – BRE has considered the ability to accommodate additional waste capacity at the Site, BRE will embark on an Environmental Screening Process (ESP) for an additional 100,000 cubic metres (representing an additional estimated one year of life expectancy). DM inquired as to where the waste was going. RL noted the options for where waste is going are currently being developed. BS noted options evaluation for horizontal and vertical would be considered. BS noted that the same ESP will be followed as was completed for the Fill Rate Amendment. – LW inquired if that 100,000 m^3 was in addition to the previous presented slide; BS confirmed that it is on top of the existing approved capacity. BS noted that the undertaking the ESP does not allow for a proponent to take a piecemeal approach (this approach can't be taken again). JM requested confirmation that BRE could not request an additional 100,000 m^3 capacity following the next planned one – BS confirmed that BRE would not be permitted to subsequently apply for additional capacity through the Environmental Screening Process. – BS noted that the process will include public consultation and notification on the Screening process would be sent out to the mailing list as well as broader publications (i.e. newspaper, direct mailings) to the community in advance of a future public meeting.

Brooks Road PLC Meeting Minutes

November 23, 2022

Project name	Brooks Road Landfill	**From**	Blair Shoniker
Subject	2022 Brooks Road PLC #3	**Tel**	+1 905 429-5040
Date/Time	November 2, 2022/7:00pm-8:00pm	**Project no.**	018235
Attendees	Katrina McCullough (KM) – GHD Blair Shoniker (BS) – GHD Ryan Loveday (RL) – GHD Tim Danyliw (TD) – BRE Chris O'Connor (CO) – MECP Hamilton District Dave Bruce (DB) - PLC Member, Chai Dave Glenney (DG) – PLC Member Kim Seaben – PLC Member Rick Armstrong (RA) – Public Diane Manto (DM) – Public Laurie Woolner (LW) – Public	**Copy to:**	All Attendees

Minutes	Action
Approvals	– BS reviewed Site approvals. – BS outlined the Streamlined Environmental Screening Process currently being undertaken for a 100,000 m3 expansion. BS noted this is a similar undertaking that was completed for the previous fill rate amendment. – BS noted that the Environmental Screening studies for each technical discipline continue to be developed. That work includes the development of impact management and mitigation measures. – Currently targeting late 2022 or early 2023 for the next Public Open House (Open House 2). The Public will be notified throughout newspaper ads, email, Canada Post mailouts and email to the PLC. – LW noted that Notice of Commencement was not clear because it did not say that the increase the capacity would be accomplished by expanding the footprint. BS informed that at the time of publishing the Notice it was not confirmed that expansion would be done by expanding the footprint horizontally. BS noted that it will be considered for future notice. – LW noted that the newspaper ad doesn't address expanding the footprint. LW noted that it should note a footprint expansion. BS noted the second sentence in the slide deck summary references the approved footprint. DB noted that the reference going forward should note that it is 100,000 m3 and that the footprint is likely to change. BS noted he doesn't agree with the statement that DB stated, and that timing of the article relative to Open House 1 is the reason why. BS noted the intent here at this PLC was to provide a summary only, rather than get into the details – LW noted that the expansion couldn't be piecemealed, and inquired why this work can. BS noted that the Environmental Screening process can't be piecemealed. BS noted the first process was an Individual EA, and this process is an Environmental Screening. LW noted that people reading the newspaper wouldn't know the details of the expansion. KM noted that Open House 2 will provide more detail with respect to the work. BS noted that this is a summary only, and not

Minutes	Action
	detailed with respect to the Environmental Screening. BS noted that the consultation in the Screening is intended to review the proposal. – DM and LW inquired about the Environmental Screening being different than the Environmental Assessment, the previous approvals (vertical expansion, change to annual amount and this latest expansion of the footprint); and why can Brooks expand vertically and horizontally with both expansions. BS noted they are both instruments under the EA Act, and they both consider consultation and environmental (natural, social, technical) aspects. LW inquired about asking for more volume (horizontal, vertical) in different ways. BS noted that it all has to do with volume – the individual EA was for more than 400,000 m3. BS outlined the steps required for the Individual EA, including Minister Approval of the Terms of Reference as well as the EA. BS noted the previous IEA took seven years. BS outlined the triggers for the Streamlined Environmental Screening including an expansion volume greater than 40,000 m3 but less than 100,000 m3. The current proposal will extend Site life by approximately one year. LW noted she was confusing the vertical expansion with the fill rate amendment relative to the process used. – DG inquired if BRE is trying to expand by digging down into existing landfill, RL replied with a yes. – DG wanted to know the slide slopes, to which RL replied 3:1 to 4:1.

Brooks Road PLC Meeting Minutes

March 23, 2023

Project name	Brooks Road Landfill	**From**	Blair Shoniker
Subject	2023 Brooks Road PLC #1	**Tel**	+1 905 429-5040
Date/Time	March 22, 2023/ 7:00pm-8:00pm	**Project no.**	018235
Attendees	Katrina McCullough (KM) – GHD Blair Shoniker (BS) – GHD Ryan Loveday (RL) – GHD Tim Danyliw (TD) – BRE Michael Durst (MD) – MECP Hamilton District Dave Bruce (DB) - PLC Member, Chair Dave Glenney (DG) – PLC Member John Metcalfe (JM) – PLC Member Diane Manto (DM) – Public Laurie Woolner (LW) – Public Rod Leclair (RL) – OPP Liaison	**Copy to:**	All Attendees

Minutes	Action
Approvals	– BS reviewed Site approvals. – BS outlined the Streamlined Environmental Screening Process currently being undertaken for a 100,000 m3 expansion. Open House #1 was held in June 2022, it is anticipated that Open House #2 will be June 2023. BS noted that the Environmental Screening studies for each technical discipline continue to be developed. – Beyond Open House #2, everything is documented in the Environmental Screening Report, which is available for MECP and Public Review. The MECP will then need to make a decision on if the Screening moves forward. – DM inquired about the definition of net effects and that it notes negative effects. BS clarified that it can be net-negative effects or net-positive effects and they are the effects that are remaining after mitigation measures are applied. BS noted the previous EA utilized the same methodology, which is an accepted approach by the MECP. – DM noted that the public only has 60 days to review. BS noted that comments are received and considered at any time.

Brooks Road PLC Meeting Minutes

June 07, 2023

Project name	Brooks Road Landfill	**From**	Katrina McCullough
Subject	2023 Brooks Road PLC #2	**Tel**	+1 416-866-2365
Date/Time	June 7, 2023/ 7:00pm-8:00pm	**Project no.**	018235
Attendees	Katrina McCullough (KM) – GHD Ryan Loveday (RL) – GHD Tim Danyliw (TD) – BRE Michael Durst (MD) – MECP Hamilton District Charlene Anderson (CA) – MECP Hamilton District Dave Bruce (DB) - PLC Member, Chair Dave Glenney (DG) – PLC Member Diane Manto (DM) – Public Kim Seabon (KS) – PLC Member Rod Leclair (RL) – OPP Liaison	**Copy to:**	All Attendees

Minutes	Action
Approvals	– KM reviewed site approvals. Noted that we are currently looking at Summer 2023 for Open House 2 and the PLC will be updated once a date is set. No date is currently set.

Brooks Road PLC Meeting Minutes

November 21, 2023

Project name	Brooks Road Landfill	**From**	Katrina McCullough
Subject	2023 Brooks Road PLC #3	**Tel**	+1 416-866-2365
Date/Time	November 1, 2023/ 7:00pm-8:00pm	**Project no.**	018235
Attendees	Katrina McCullough (KM) – GHD Ryan Loveday (RL) – GHD Axita Patel (AP) – GHD Tim Danyliw (TD) – BRE Jeremy Gamble (JG) – MECP Hamilton District Charlene Anderson (CA) – MECP Hamilton District Dave Bruce (DB) - PLC Member, Chair Kim Seabon (KS) – PLC Member Richard Clark (RC) - Member of the Public Laurie Woolnor (LW) – PLC Member Tara Lindemann – Haldimand Press	**Copy to:**	All Attendees

Minutes	Action
Approvals	– AP reviewed the current EA approval process, noting the change in Ontario regulation. AP noted we recently held Open House 2 and are currently in the public commenting phase. The Draft Environmental Screening Report will be completed in draft by the end of November. The final report will be submitted and available for 60 days and then GHD will issue a Notice of Completion. – DB was invited to a Council meeting in June 2014 (June 17, 2014) when BRE wanted to incorporate the north rail line into the zoning of the dump site and DB has a notice of Public Meeting for Zoning and Official Plan amendment. DB noted that the councillors were well informed about everything

	going on. DB inquired as to what benefit there was to the public in incorporating the north rail line into the dump site. – DB noted the details of the application for public meeting; “the purpose of this application is to amend the Designation of the official plan and zoning of the town of Haldimand zoning by-law 1H86 of the subject property to facilitate the extension of the northern rail line to act as an additional buffer zone and temporary storage of clean clay and relocation of groundwater monitoring wells. It has been assured by the proponent that there will be no landfilling on added lands and no change to the existing waste footprint of the land site will take place”. DB says that BRE says something, and you can’t believe them, they will say what they want and get what they want. KM noted she would put that into the meeting and asked if he could share the document. DB agreed to let KM take a photo of the document. MECP inquired about the date of the document and DB replied it was June 17, 2014. DB said he wished John Metcalfe was here to hear it and DB will make sure he gets a copy of it. – DB asked if the approval for the expansion goes through, is it correct that you have to dig down to the bottom of the current cell where a liner and another liner would be fused? RL said that the northern expansion cell adjacent to the current landfill doesn’t go as deep. The base is projected to be about 4-5 m higher than the existing low point in the current cell. – DB asked how the leachate would be handled in the new cell. RL responded that there would be a new pipe on the side slope that would pump into the same leachate treatment system. – DB noted that Stoney Creek is expanding horizontally, and they have nothing but problems, they have dug down to the bottom level which is causing odour issues. He thinks that if the same will happen here and they dig down the leachate, you can expect the same thing with odour problems. KM disclosed that GFL is a client and can speak to what has been released from GFL. KM explained that odour issues were caused by leachate and not cell construction. KM noted there was cell construction prior to the leachate odour issue and that was causing odours, but the odour issues since the summer have been caused by leachate. KM noted that the leachate is treated at BRE in a closed system and that GFL treats leachate in an open pond. DB asked CA if she is involved. CA noted she has previously responded to after-hours complaints and that others are on that file. CA noted that yes there are odour issues, and it is being dealt with by the area officer. There have been many meetings with GFL, MECP, and GHD. CA confirms that both the landfills are not designed the same way.

	– DB inquired if odour complaints have been since the start or recent; CA said she isn't aware. DB asked is an open pond to mange leachate is permitted, CA responded yes. – KS asked if you can guarantee there won't be odors. TD responded that the design is intended to minimize odour and that the expansion drainage layer will not be hydraulically connected to the existing landfill drainage layer. This manner of construction will drastically reduce the need for waste excavation and thus avoid odours as best as possible. – KM noted that GFL had construction into an existing cell, and they anticipated odour (with advanced notification) – there were some odour complaints and then the leachate issue occurred later. LW inquired if GFL offered air conditioners like Glanbrook did so that owners could keep windows shut. KM noted that she is not aware. – RC noted that multiple expansions have occurred and inquiring if there are plans for more. He noted that it's a dog and pony show and that they never got the truth. He asked what the reality of this in the long term is and what is to say that we are not going to purchase more land. He mentioned that the reason there are no complaints is because the people have given up and it's a horrendous situation. RL noted it is a business and supply/demand decision. RC asked where those people are who makes these decisions. RC noted that he saw a dental hygienist and she apologized for odour and he noted it was the dump. The hygienist didn't know that there is a landfill nearby. He noted that it would be better if there was truth behind it. He has written many emails and phone calls and hasn't heard back. – KM noted that there is a business decision once capacity is reached so that it is impossible to say exactly when a business case would continue. RC said that they made statements. RC called them a used car salesman. – KS asked why was this land chosen to be a landfill? DB noted that it was a garbage dump and nothing was regulated and later the government gave that piece of property it's designation. DB noted that the property was purchased by a couple of guys (who borrowed money from Romspen). Over 2-3 years the site went into receivership and Romspen took it over and still owns it. RC noted that a dump was also permitted as a wrecking yard; KS noted that is the case as long as it is open. – DB inquired about silt fence/chain-link around the Site. TD noted that there is a silt fence and an exclusion fence. DB mentioned that Amy from GHD at the Open House said that in case of heavy rainfall, the water would come off the dump site if it ever got out of the leachate collection ditches it would flow across and the silt fence would stop the debris and any water

Minutes	Action
	that got off the site would be tested. KM noted that she was present during this conversation and that Amy didn't realise that you were talking about the active landfill. She was talking about the outside of the landfill area. RL noted yes, she was talking about the perimeter fence not the landfill site. DB inquired if you also test the water outside the boundaries. RL noted that surface water is tested as part of the quarterly system. – RC inquired about studies to Grand River – RL noted he doesn't have all the details, but that discharge to the roadside ditch and to the south was part of the discharge approval.

Comments on Brooks Road Landfill expansion ESR

Table 1 **Comments from MECP on the ESR**

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
02/06/2024	Email	Report Inconsistencies	Several sections of the draft ESR are displaying error messages. This should be corrected in the final ESR. Examples: Sections: 6. Summary of Comments Received, 3.1.4 Description of Surface Water Existing Conditions, 4.2.3 Surface Water Net Environmental Effects, etc.	Comment addressed
		Screening Criteria Checklist	The Screening Criteria Checklists in Section 2.2, Appendix C Section 2, and Appendix B contain inconsistences: • Row 1.3 in Section 2.2 checks “No” and states that the sedimentation effects caused by the project are “not anticipated to be significant”; Row 1.3 in Appendix B checks “Yes” and states that the project “may cause sedimentation”.	Criteria 1.3 is addressed in Appendix A – Surface Water Assessment Report and matches with Section 2.2 of ESR. The text in the “additional information” column is updated to match the ESR.
			• In Appendix B, Row 2.1 is omitted, and Row 2.2 is duplicated.	Comment addressed
			• Row 2.5 in Section 2.2 and in Appendix C Section 2 check “Yes” and state that the project “may require the use of hazard lands”; Row 2.5 in Appendix B checks “No” and states that the project “would not require the use of hazard lands”.	Appendix B of the Open House Summary Report contains the Display Boards presented during Open House 1 in June 2022. The Screening Criteria Checklist in Appendix B was prepared at the start of this project and has been updated based on the feedback received at the Open House and subsequent consultation with interest holders, along with information obtained through investigation and technical studies.
			• Row 4.1 in Section 2.2 checks “Yes” and states that “numerous” Species At Risk exist within the project site; Row. 4.1 in Appendix B checks “No” and states that “no” Species At Risk exist within the project site.	
			• Row 4.4 in Section 2.2 states that a Wildlife Activity Area is “present within the Study Areas”; Row 4.4 in Appendix B states that “none have been identified as being present on-site”.	
			• Row 4.7 in Section 2.2 checks “No” and states that the land changes cause by the project are “unlikely to cause an increase in bird hazards”; Row 4.7 in Appendix B checks “Yes” and states that land changes “may cause an increase in bird hazards”.	

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			• Row 6.1 in Section 2.2 and Appendix C Section 2 check “No” and state that the project “will not cause negative effects” to character; Row 6.1 in Appendix B checks “Yes” and states that the project “may cause negative effects” to character.	
			• Row 6.3 in Section 2.2 checks “No” but states that the project “may cause negative effects” on local businesses; Row 6.3 in Appendix C Section 2 checks “No” and states that the project “would not result in negative effects” on local businesses; Row 6.3 in Appendix B checks “Yes” and states that “may cause negative effects” on local businesses.	Updates made to “additional information” text in the ESR Section 2.2, Row 6.3 to align with Appendix C. Appendix B of the Open House Summary Report contains the Display Boards presented during Open House 1 in June 2022. The Screening Criteria Checklist in Appendix B was prepared at the start of this project and has been updated based on the feedback received at the Open House and subsequent consultation with interest holders, along with information obtained through investigation and technical studies.
			• Row 6.9 in Section 2.2 and Appendix B state that a “private airfield used for soaring” is located near the project site; Row 6.9 in Appendix C Section 2 states that the “Cayuga East Airport” and “a private airfield used for soaring” are located near the project site.	Text updated in the ESR to align with Appendix C. Appendix B of the Open House Summary Report contains the Display Boards presented during Open House 1 in June 2022. The Screening Criteria Checklist in Appendix B was prepared at the start of this project and has been updated based on the feedback received at the Open House and subsequent consultation with interest holders, along with information obtained through investigation and technical studies.
			• Row 6.11 in Section 2.2 checks “No” but states that the project “may cause negative effects” on public health and safety; Row 6.11 in Appendix C Section 2 checks “No” and states that the project “would not cause any negative effects” on public health and safety; Row 6.11 in Appendix B checks “Yes” and states that the project “may cause negative effects” on public health and safety. Please review and correct accordingly. If no correction is needed, please provide the reasoning of these discrepancies.	
		Surface Water	All the comments regarding surface water refer to the Surface Water Assessment Report in Appendix A. Section 3.2.1 describes the current surface water monitoring program that quarterly sampling of a comprehensive list of parameters at three off Site background locations (SW1, SW8, and SW9), two on – site locations (SW2 and SW5), and four locations downstream (SW3, SW4, SW6, and SW7). Surface water quality is assessed against the Provincial Water Quality Objectives (PWQO), and an attempt is made to correlate surface water monitoring with rainfall events using the precipitation data from John C. Munro Hamilton International Airport (HIA). The proposed expansion does not appear to impact the access or remove any of the current monitoring locations. As such, there is no need to relocate or establish new monitoring locations due to the expansion. The current monitoring program is sufficient to determine impacts from landfilling activities on the site.	Comment noted.
			The ministry previously conducted review of recent Operations and Monitoring Reports (2020, 2021, 2022) and noted that quarterly samples at various locations are often missed due to dry or stagnant water conditions at the monitoring locations. A better effort to collect surface water samples under appropriate conditions should be made, so that there is an adequate data set to determine impacts from the landfill. The HIA rainfall data is not representative of the actual rainfall that the site receives as it is too far away from the site. The HIA data is also not available in real-time making it difficult to plan sampling events that are dependent on adequate rainfall. The Grand River Conservation Authority (GRCA) operates a real-time rainfall gauge in York (York, Station 12122042) that is	The suggested station will be reviewed by the team that prepares the Operations and Monitoring Reports and appropriate changes will be implemented, as required.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			approximately 8 km to the northwest of the site, as compared to HIA that is 24 km to the north. Real-time data can be accessed from the GRCA website at the hyperlink below. Using the rainfall data from the GRCA's York station will not only more accurately reflect rainfall totals experienced at the site, but also be more useful in planning surface water sampling events. Historical data can be accessed from GRCA upon request from the second hyperlink below. GRCA Real Time Rainfall Data Link: https://apps.grandriver.ca/waterdata/kiwischarts/rf_rainfallsummary.aspx#gsc.tab=0 GRCA Historical Data Downloads: **https://data.grandriver.ca/downloads-monitoring.html**	
			While assessing surface water quality against the PWQO is sufficient for many parameters, the owner should consider assessing surface water quality against the Canadian Water Quality Guidelines (CWQG) for the protection of aquatic life (long-term exposure) values as well. PWQO values are no longer being updated based on recent science and it is the intent of the Ministry to adopt CWQG as they are updated from time to time. In general, it is good practice to use the more recently developed of the PWQO or CQWG to assess surface water quality. In many cases the CWQGs are based on more recent science and toxicity data than the PWQO and are more appropriate for assessing impacts to surface water. It should be noted that some CWQG include calculations considering toxicity modifying factors or are based on the dissolved proportion of a contaminant. For example, the CWQG for zinc is based on dissolved zinc using a calculation that considers hardness and dissolved organic carbon (DOC). To assess surface water quality against the CWQG the sampling program may need to be modified to include toxicity modifying factors (hardness, DOC, pH, etc.) and sampling requirements (i.e., field filtering for dissolved metals). That being said, a number of contaminants are naturally elevated in the surface water features near the site as demonstrated by background water quality data. For these contaminants, it is still appropriate to compare concentrations at potentially impacted locations to the historical range of background concentrations. Section 4.1 includes a summary table of proposed capacity expansion design (Table 4.1) on page 10 and 11.	The Owner will consider this information and review with the team that prepares the Operations and Monitoring Report, and appropriate changes will be implemented, as required.
			The existing stormwater pond capacity is sufficient for the proposed expansion based on the existing stormwater management plan. Further to a review of the stormwater management plan prepared by Conestoga Rovers and Associates dated September 2013, it is confirmed that the existing pond has sufficient capacity for the proposed expansion. As such, no changes to the existing stormwater pond are required.	Comment noted.
			The proposed expansion requires that the stormwater drainage ditch along the northern expansion is to shift by approximately 30 meters. Additionally, the perimeter access road along the northern expansion area is to be shifted by 29 meters. Currently, the northern extent of the access road and stormwater ditch are	Construction period erosion and sediment control measures will be part of detailed design. Changes have been made to the Mitigation Measures section of the Surface Water Assessment Report as well as the ESR in response to the comments.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			adjacent to the former railway that ran along the northern edge of the site. As such, it is possible that there are historical contaminants associated with railway ballast may be disturbed by the excavation of the existing berm and construction of new access road and drainage ditch. • Will the quality of the soils/materials to be removed be assessed, and what mitigation strategies will be in place to prevent the mobilization of these contaminants into the stormwater management system or of-Site drainage? • Additionally, it is recommended that an erosion and sediment control plan be followed during construction to prevent the downstream transport of excess sediments. • If significant dewatering (e.g. greater than 50,000 liters/Day) is required to construct the roadway and ditch, then a Permit to Take Water (PTTW) may be required or if the water taking meets the requirements of the Environmental Activity Sector Registry (EASR) then the activity would need to be registered. Further information on the PTTW program and water taking EASR can be found at the following links: o PTTW Link: https://www.ontario.ca/page/permits-take-water o EASR Link: https://www.ontario.ca/page/water-taking-user-guide-environmental-activity-and-sector-registry#section-2 Sections 4.3.1 and 4.3.2 discuss potential effects on surface water and proposed mitigative measures, respectively. These include potential surface water quality impacts and surface water quantity impacts.	
			Potential water quality impacts include minor erosion/soil loss from the landfill cap due to steeper slopes. This may lead to increases total suspended solids (TSS) and associated contaminant (e.g. metals entrained in the soil) runoff into the stormwater management system. The existing stormwater management ditches and pond should be sufficient to mitigate these impacts. However, increased TSS loads to the pond may result sedimentation within the pond that could lead to reduced capacity or increased maintenance (i.e. cleanout, dredging of pond sediment). Reductions in pond capacity and inspection and maintenance of the pond should be addressed through the stormwater ECA. Additionally, the final cover should be revegetated with native plants to increase soil stability and reduce erosion/soil loss from the final cover.	The operations and maintenance requirements of the pond include checking for sediment accumulation and requiring cleanout when maintenance threshold is reached.
			The proposed expansion is not anticipated to result in a significant increase in peak flow rates or runoff volumes. The hydrological modeling that was conducted based on the proposed expansion scenario included analysis of storm events from the 2 year up to 100 year, 24 hour SCS Type 2 distribution. This is consistent with the guidance provided in the MECPs Stormwater Planning and Design Manual, 2003. It is expected that the expanded stormwater drainage ditch and SWM pond have sufficient capacity for any minor increases in peak flow or volume that may occur as a result of the expansion. As such, no modifications to the existing stormwater management works are required, other than the proposed modifications to the stormwater drainage ditches to capture stormwater from the capped landfill areas.	Comment noted

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			Section 5.2 summarized previous monitoring results. In addition, the ministry recently reviewed the 2020, 2021 and 2022 operations and monitoring reports for the site (see attached). The ministry provides the following comments from that review. In General, water quality on Site and downstream are similar within the historical ranges of the background locations with some exceedances of the relevant PWQO values for select metals and general chemistry parameters noted. However, there are some notable exceptions, as follows: • SW5 – Boron concentrations were elevated above historical background concentrations and have shown a slight increasing trend since 2017. • SW3 – while SW3 was not sampled in 2022 due to dry conditions, the historical data record indicates occasional concentrations of select metals (Iron in 2019) and PAHs greater than the background locations. GHD has suggested that elevated metals and PAH concentrations are not associated with leachate but may be related to historical slag piles and road ballast along the site entrance. SW2 has also experienced similar elevated concentrations in the past, however it appears to be locally isolated as results from further downstream at SW4 are within the range of historical background concentrations. • SW6 – The 2021 data showed some detections of PAH above background concentrations, which GHD suggested may be relate to historical slag piles rather than landfill leachate. GHD also noted an increasing trend in boron concentrations since 2012. While GHD indicated that surface water quality is not impacted by landfill leachate, there are some concerning trends including increasing boron concentrations at SW5 and SW6, and occasional detections of PAH above background concentrations at SW2, SW3 and SW6. • The increasing boron concentrations may be related to landfill leachate as boron has been selected as a leachate indicator for the site. This trend should be monitored closely as it could be an indication of a failure in the leachate collection system or leachate seeps. • While the PAH exceedances may not be related to landfill leachate, it is recommended to maintain the current monitoring program to determine if any additional actions may be required. This could include delineation of the impacts from the historical slag piles and road ballast that have been suggested by GHD as a potential source of observed metals and PAH exceedances.	The trend for Boron and PAHs will be reviewed and actions may be proposed, if warranted. This could include potential delineation of historical activities that have the potential to cause impacts.
			I have the following comments as relates to surface water content in the referenced reports and the requirements of the ECAs. While reviewing each individual report (2020, 2021, 2022) I noted the conclusions, recommendations and concerns from a surface water perspective were similar. As such, the comments noted below, and section references correlate to the latest report (2022 Operation and Monitoring Report) 1) Section 4.1.3 describes the Surface Water Monitoring program that is conducted at nine locations (two on Site, and seven off Site). Surface water samples are collected on a quarterly basis during flowing conditions that correlate with rainfall events where possible. GHD notes that they use precipitation data from John C. Munro Hamilton International Airport (HIA) in Mount Hope, Ontario that is 24 kilometers to the north. In the 2020, 2021, and 2022 reports it is noted	The suggested station will be reviewed by the team that prepares the Operations and Monitoring Reports and appropriate changes will be implemented, as required.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			that conditions are often dry during the sampling events resulting in missed opportunities to assess off-Site impacts. Comment 1: The HIA precipitation data is not representative of the actual rainfall that the Site receives as it is too far away from the Site. The HIA data is also not available in real-time making it difficult to plan sampling events that are dependent on adequate rainfall. The Grand River Conservation Authority (GRCA) operates a real-time precipitation gauge in York (York, Station 12122042) that is approximately 8 km to the northwest of the Site. Real-time data can be accessed from the GRCA website at the hyperlink below. Using the precipitation data from the GRCA's York station will not only more accurately reflect precipitation totals experienced at the site, but also be more useful in planning surface water sampling events. Historical data can be accessed from GRCA upon request from the second hyperlink below. GRCA Real Time Precipitation Data Link https://apps.grandriver.ca/waterdata/kiwischarts/rf_rainfallsummary.aspx#gsc.tab=0 GRCA Historical Data Downloads https://data.grandriver.ca/downloads-monitoring.html It is recommended that the GRCA York (station 12122042) precipitation gauge be used for planning and correlating surface water monitoring with precipitation events. Precipitation data from HIA may also be used for verification, but the GRCA York station is likely more representative. A better attempt should be made to plan sampling events following significant rainfall event (i.e., greater than 15mm over 24 hours) to ensure off Site impacts can be properly assessed.	
			2) Section 5.1 on page 9 includes a table with reasoning for samples that were not collected in 2022. The 2020 and 2021 reports also contain similar tables. The table notes that many samples were not collected due to dry conditions or insufficient volume. Comment 2: Following my recommendation noted in comment 1 may result in more samples collected at more monitoring locations by targeting sampling after rainfall events of adequate volume (i.e., greater than 15mm over 24 hours).	Comment noted and will be addressed during operations and monitoring.
			3) Section 5.5 notes that surface water quality is assessed against the Provincial Water Quality Objectives (PWQO) where available. Comment 3: While assessing surface water quality against the PWQO is sufficient for many parameters, the consultant (GHD) should consider assessing against the Canadian Water Quality Guidelines (CWQG) for the protection of aquatic life (long-term exposure) values as well. In many cases the CWQGs are based on more recent science and toxicity data than the PWQO and are more appropriate for assessing impacts to surface water. It should be noted that some CWQG include calculations considering toxicity modifying factors or are based on the dissolved proportion of a contaminant. For example, the CWQG for Zinc is based on dissolved zinc using a calculation that considers hardness and dissolved organic carbon (DOC). To assess surface water quality against the CWQG the sampling program may need to be modified to include toxicity modifying factors (hardness, DOC, pH, etc.) and sampling requirements (i.e., field filtering for dissolved metals).	The Owner will consider this information and review with the team that prepares the Operations and Monitoring Report, and appropriate changes will be implemented, as required.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			4) Section 5.5 discusses surface water quality both on and off Site and the results historical results are presented in Appendix G. In General, water quality on Site and downstream are similar within the historical ranges of the background locations with some exceedances of the relevant PWQO values for select metals and general chemistry parameters noted. However, there are some notable exceptions. a. SW5 – Boron concentrations were elevated above historical background concentrations and have shown a slight increasing trend since 2017. b. SW3 – while SW3 was not sampled in 2022 due to dry conditions, the historical data record indicates occasional concentrations of select metals (Iron in 2019) and PAHs greater than the background locations. GHD has suggested that elevated metals and PAH concentrations are not associated with leachate but may be related to historical slag piles and road ballast along the site entrance. SW2 has also experienced similar elevated concentrations in the past, however it appears to be locally isolated as results from further downstream at SW4 are within the range of historical background concentrations. c. SW6 – The 2021 data showed some detections of PAH above background concentrations, which GHD suggested may be relate to historical slag piles rather than landfill leachate. GHD also noted an increasing trend in boron concentrations since 2012. Comment 4: While the results indicate that surface water quality is not impacted by landfill leachate, there are some concerning trends including increasing boron concentrations at SW5 and SW6, and occasional detections of PAH above background concentrations. The increasing boron concentrations may be related to landfill leachate as boron has been selected as a leachate indicator for the site (see section 5.2.2. of the 2022 report). This trend should be monitored closely as it could be an indication of a failure in the leachate collection system or leachate seep to surface water. While the PAH exceedances may not be related to landfill leachate, it is recommended to maintain the current monitoring program to determine if any additional actions may be required. This could include delineation of the impacts from the historical slag piles and road ballast that have been suggested by GHD as a potential source of observed metals and PAH exceedances.	The trend for Boron and PAHs will be reviewed and actions may be proposed, if warranted. This could include potential delineation of historical activities that have the potential to cause impacts.
			5) The reports discuss SWMS pond sampling in section 6.2. On occasion the samples indicated trigger level exceedances of pH (both field and lab), arsenic and boron. It is noted in the 2020 report that the trigger level for boron was increased from 0.2 mg/L to 1.5 mg/L which is consistent with the newer developed CWQG for boron. Since this change there have been no trigger exceedances for Boron. GHD noted a well that on occasion in 2021, re-sampling within 2 weeks of an exceedance was not completed, which does not conform with Condition 11 (10) of the SW ECA. Regardless of some occasional minor exceedances of the trigger levels the data indicates the SWMS Pond is functioning adequately to prevent impacts from the on-Site stormwater to the Brooks Road ditch and Norton Creek.	Comment noted and will be addressed during operations and monitoring.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			Comment 5: The owner should ensure that re-sampling following trigger level exceedances is completed, as it was shown that was not for some events in 2021. This represents a non-compliance with Condition 11 (10) of the SW ECA.	
		Consultation and Engagement	11. Appendix J.1 Stakeholder Tracking Database should be updated with the following changes: • Charlene Anderson is no longer the Environmental Officer of the site of this project and should be removed from the stakeholder list. Instead, the current Environmental Officer, Jordan Balch's, contact information should be added to the list: Jordan.Balch@ontario.ca. • Joan Del Villar Cuicas is no longer acting in the position. The word acting can be removed. • Carolynn Lee is no longer the Special Project Officer for this site and should be removed from the stakeholder list. Please include Andrew Evers, Project Coordinator Unit Supervisor, Environmental Assessment and Permissions Division, Andrew.Evers@ontario.ca.	Noted and changes made accordingly.
			12. Please ensure all the consultation records are included in the final report (i.e., correspondence from virtual meeting with the Mississaugas of the Credit First Nation was held on July 19, 2022, and An in-person meeting with members of the Six Nations scheduled for January 12, 2024.	All correspondence with Indigenous Communities including the correspondence with Mississaugas of the Credit First Nation and with the Six Nations is included in Appendix I.5
		Notice of Completion	13. Please ensure that the Notice of Completion, the follow-up correspondence, and the responses from stakeholders are included in the final Environmental Screening Report.	Notice of Completion is included as Appendix J in the ESR. Comments received on the draft ESR from Government Review team and Public are included in Appendix I7 in the form of comment-response tables.
			14. It is recommended to circulate the Notice of completion to the updated Indigenous consultation contacts below, as the contacts that were used initially may no longer be available. • Six Nations (elected) Chief- Sherri-Lyn Hill sngr.chief@sixnations.ca 2498 Chiefswood Rd. P.O Box 5000, Oshweken ON N0A 1M0 519-445-2201 cc. Dawn Russell- dawnrussell@sixnations.ca (consultation) Peter Graham- LRCS@sixnations.ca • HDI- info@hdi.land Haudenosaunee Confederacy c/o- HDI P.O. Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
		Species at risk	15. It is the responsibility of the proponent to ensure that Species at Risk are not killed, harmed, or harassed, and that their habitat is not damaged or destroyed through the proposed activities to be carried out on the site. If the proposed activities cannot avoid impacting protected species and their habitats, then the proponent should contact SAROntario@ontario.ca and an Information Gathering Form will be required.	Comment noted. Given that the proposed expansion is within the Site boundary, no impacts to SAR species habitats are anticipated. Mitigation measures have been included in Section 4.3.2 detailing general best management practices for encountering any wildlife or potential SAR on Site. Should the proposed activities change, an IGF will be completed if required.
		Climate Change	16. Climate change considerations have not been documented in the ESR. The document “Considering Climate Change in the Environmental Assessment Process” (Guide) (www.ontario.ca/page/considering-climate-change-environmental-assessment-process) is now a part of the EA’s program’s Guides of Codes of Practice. The Guide sets out the ministry’s expectation for considering climate change in the preparation, execution and documentation of environmental assessment studies and processes/ The Guide provides examples, approaches, resources, and references to assist proponents with consideration of climate change in EA. The proponent should review this Guide in detail. The ministry expects proponents of Waste Regulation projects to: • Consider the project's expected production of greenhouse gas emissions and impacts on carbon sinks (climate change mitigation), as well as resilience or vulnerability of the undertaking to changing climatic conditions (climate change adaptation). • Include a discrete section in the ESR detailing how climate change was considered in the EA. How climate change is considered can be qualitative or quantitative in nature and should be scaled to the project’s level of environmental effect. In all instances, both a project's impacts on climate change (mitigation) and impacts of climate change on a project (adaptation) should be considered.	New section 4.5.1 is added to the ESR addressing GHG emissions and impacts on Carbon Sinks.
		Air Quality	17. It is understood that the proposed expansion is to allow operations to continue at the current approved annual fill rate and waste filling capacity and that there are no proposed changes to these limits as part of this project. The proposed expansion would increase the capacity of the landfill by 219,400 m3 , which would result in a total capacity of 1,264,4651 m3 . Ontario Regulation 232/98 requires the mandatory collection of landfill gas for new or expanding sites with a total waste disposal capacity greater than 1.5 million cubic metres. Given, that the proposed expansion is below this threshold, the mandatory collection of landfill gas is not required. In some cases, air emissions control may still be recommended for smaller sites based on factors such as waste type, site location near a populated area, and operational practices. In this case, the proposed expansion does not include any changes to the waste type currently received at the site (post-diversion solid non-hazardous Industrial, Commercial & Institutional waste) or changes to operational practices. Another important factor is that the site is not located in a populated area and is primarily surrounded by agricultural land uses. It was also noted that there are currently no planned developments around the site. Based on these and other considerations, it was determined that a recommendation for air emissions control was not warranted at this time.	Comment noted.
			18. Section 3.3.1 of the ESR states that the Site-Vicinity Study Area is the area within the vicinity of the Site extending approximately 500 m in all directions. Section 3.3.3.1 states that “there are no residential, institutional, or recreational	Inconsistencies addressed in the ESR. A new sensitive receptors map (Figure 3.10 in the ESR) is included showing the eleven residential properties and the approximate distance of the closest sensitive receptor within the Study Areas.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			lands designated within the Site-Vicinity Study Area". However, in Section 3.3.3.11 it states that "the closest residential dwelling is located approximately 232 m northwest of the Site" and that in the overall Local Study Area (LSA), which is within 1 km of the Site-Vicinity Study Area, there are 11 residential dwellings. Section 3.4.4.1 then states that the closest receptor is approximately 165 m from the Site. Based on these statements, the location of the nearest sensitive receptors/residences is unclear. Please clarify. If available (e.g., as part of the ESDM or Odour Management Plan), please also provide a map of the nearest sensitive receptors.	
			19. In Table 2.1 (Screening Criteria Checklist), it was indicated that the proposed expansion may result in an increase in emissions of greenhouse gases associated with continued operation of the Site. Though carbon monoxide concentrations are briefly discussed in the ESR, a more fulsome discussion of greenhouse gases, their mitigation and climate change are omitted. The expectation is that the ESR should include a section dedicated to the discussion of greenhouse gases and climate change and that this discussion includes an assessment of greenhouse gas emissions, and consideration of the following: • The effect of the project on climate change; • The effects of climate change on the project; and • Various means of identifying and minimizing negative impacts during project implementation. The goal is to ensure that the project has taken into account alternative methods to reduce its greenhouse gas emissions and negative impacts on carbon sinks and that the project has been planned in a manner that takes into account future changes in climate and the impacts a changing climate could have on the project. Please revise accordingly.	New Section 4.5.1 has been added to the ESR addressing GHG emissions and impacts on Carbon Sinks.
			20. It was noted that odour was one of the concerns raised during the public consultation. It is understood that the site has an Odour Management Plan and standard operating procedure to address odour and odour complaints and that the Odour Management Plan will be updated and submitted as part of the ECA process. In Appendix E the 2021 Operations and Monitoring Report indicates that there were two odour complaints documented in 2021. Please confirm the odour complaint history for 2022 and 2023. Please also include any other complaints related to dust and general air quality.	Three complaints were recorded in 2022 in the months of March, April, and October. No complaints were received in 2023.
			21. In Section 1.5, the ESR notes that some level of construction will be required for the expansion, including re-engineering the Site's final contours and modification of the northern perimeter access road and stormwater drainage ditch. Though Section 4.4.3 does state that the potential negative environmental effects during construction related to dust and odour will be mitigated through the use of best management practices, Section 4.5 (Air Quality) should also include a discussion of construction impacts and mitigations. In particular, given that TSP levels at the property boundary are already slightly over the Ambient Air Quality Criteria, a specific dust management plan should be developed for the construction period that includes additional/enhanced measures to mitigate dust impacts. Creating a version of the mended. Please revise the ESR accordingly.	Text has been added to Section 4.5.2 of ESR commenting on construction and Dust Management Plan.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			22. It is understood that the project's air quality and odour assessment was based on a number of supporting documents including the site's existing Emission Summary and Dispersion Modelling (ESDM) Report and Odour Monitoring Program results. Ideally, the air quality assessment documentation in the appendices should include a copy of these reports or sufficient details to support the conclusions made in the body of the ESR. However, the Air Quality and Odour Assessment Report in Appendix D essentially repeats the information provided in the body of the report. Please provide a copy of the site's most recent ESDM and Odour Monitoring Program results to permit a more complete review of the ESR's air quality assessment conclusions.	Copies of the most recent ESDM and Odour Management Plan have been added to the Air Quality and Odour Assessment Report appendices.
		Air Compliance	23. Odour/Odour Management Plan – A revised Odour Management Plan should be provided that incorporates the future configuration and operations at the site and updated sensitive receptors.	A copy of the most recent Odour Management Plan has been added to the Air Quality and Odour Assessment Report appendices
			24. ESDM Report / Reg.419/05 compliance – The ESR document indicates a modelled off-site concentration for Suspended Particulate Matter above the Ministry's 24-hour limit of 120 ug/m3 (at 122.4ug/m^3). The non-compliance should be addressed.	Particulate matter was previously assessed and approved. There have been no changes to the concentrations that were originally approved.
			25. Leachate Treatment System – How will the prolonged operation of the site and the potential for increased leachate generation rates impact the design, operation or effectiveness of the leachate treatment system?	The incorporation of Stage 9 is predicted to increase the peak leachate generation rate from 46 to 49 m^3/day. Post-closure leachate generation rates are estimated at 39 m^3/day. The Leachate Treatment System is designed with a treatment capacity of 200 m^3/day. As such, no impacts to the design, operation, or effectiveness of the leachate treatment system are anticipated due to construction of Stage 9. As with the current approved design, peak leachate generation rates are predicted to exceed the approved daily average of 45 m^3/day for discharge to the roadside ditch. During periods where leachate generation is greater than 45 m^3/day, excess treated effluent will be temporarily stored in effluent discharge holding tanks prior to loading into tanker trucks for hauling off-Site for disposal at an approved facility. Post-closure leachate generation rates are predicted to remain below the average daily roadside ditch discharge limit.
		Noise Quality	26. Screening Report Section 3.5.3.1 / Appendix E Section 3.1.3: How is the concern with tracked vehicle noise being addressed?	Tracked vehicles were evaluated as steady state noise sources in App E report & Feb 2024 ECA AAR update. See Section 3.2.5.
			27. Screening Report Section 3.5.4.2 / Appendix E Section 3.2.2: Please refer to the MECP guideline document "Noise Guidelines for Landfill Sites" dated October 1998 for assessment of noise impact(s) of the offsite haul route.	Per Noise Guidelines for Landfill Sites 1998, "*For a landfilling site employing off-site source vehicles (i.e. vehicles hauling waste or cover material to the site) that constitute a predominant component of the background noise, an access route should be selected which will result in a minimum noise impact. The selection process should be based on a detailed quantitative assessment of noise impact on individual receptors and the number of affected receptors along the alternative routes.*" This EA is for the vertical and horizontal expansion of the landfill capacity and there are no operational changes proposed to the daily or annual tonnage of waste received or routes used by haul trucks. Therefore, off-site haul routes were not evaluated. The landfill guideline is to evaluate potential alternatives during the design phase which is not applicable in this instance.

Date of Comment	Method of Communication	Topic	Comment from MECP	How the Comment was Considered
			28. Screening Report Section 3.5.5.1 / Appendix E Section 3.2.5: • It appears that the numbers of some noise sources (i.e., enclosed leachate aerator, bulldozers) are not the same as those given in the Acoustic Assessment Report submitted in support of the application for ECA No. 7323-C6EJUM. Please clarify. • Will there be cover moving operations outside of the daytime operating hours? • Please note that NPC-300 is the basis for assessment of ancillary noise sources. • It is preferred that the sound emission levels of any existing equipment for which access can be provided be obtained through sound level measurements.	• The only difference is that the ESR noise assessment includes 2 compactors and the new Feb 2024 Acoustic Assessment Report (AAR) has 1. As the ESR report is conservative with the higher number of compactors, no edit is required. • Both the ESR and AAR confirm no cover operations outside daytime operations. • Noted. ESR and AAR document the evaluation of ancillary sources separately against NPC-300. • Noted.
			29. Please comment on any possibility of vacant lot points of reception in the agriculture zones near the facility.	Per previous MECP reviews of the ECA AARs the review of potential vacant lots has been completed and approved by the MECP. Anthony Martella (noise review engineer) confirmed this back in 2021 ECA review. GHD again reviewed the zoning to confirm there is no potential vacant lots that need to be evaluated.
		Final Comments	Thank you for circulating this draft ESR for the ministry's consideration. Please document the provision of the draft Report to the ministry as well as this Project Review Unit Comments letter in the final report, and please provide an accompanying response letter to support our review of the final report. A copy of the final Notice should be sent to the ministry's West Central Region EA notification email account (eanotification.wcregion@ontario.ca).	Comment noted

<tr><th>Date of Comment</th><th>Method of Communication</th><th>ESR Section</th><th>Comment from MCM</th><th>Response</th></tr>
<tr><td rowspan="2">02/05/2024</td><td rowspan="2">Email</td><td>General comments</td><td>The draft ESR should better document the due diligence related to cultural heritage resources, e.g., the screening carried out to identify them, or measures to be taken to avoid or mitigate impacts on them. MCM's letter, dated December 4, 2023, included advice on how to screen the project area for cultural heritage resources. We have the following comments and recommendations:
• We continue to recommend that the EA project be screened using the Ministry's Criteria for Evaluating Archaeological Potential to determine if an archaeological assessment is needed. If the EA project area exhibits archaeological potential, then an archaeological assessment (AA) shall be undertaken by an archaeologist licensed under the Ontario Heritage Act (OHA), who is responsible for submitting the report directly to MCM for review during this planning phase. Any further recommended archaeological assessments (e.g., Stage 2,3,4) should be completed as early as possible during detailed design and prior to any ground disturbing activities.
• The screening checklist, Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes, developed by the Ministry of Citizenship and Multiculturalism, was completed as part of the Environmental Screening Report (see Appendix G) determining that the study area has low potential for built heritage resources and cultural heritage landscapes. Therefore, no technical cultural heritage studies have been undertaken.</td><td>The Checklist for evaluating Archaeological Potential is completed and attached as Appendix G1 in the ESR.

The Checklist for evaluating the Potential for Built and Cultural Heritage Resources and Landscapes is completed and attached as Appendix G2 in the ESR</td></tr>

				recommendations of the report, as is in the Executive Summary – just copy and paste, don't summarize.] 3.7.3.2. ~~1~~ Built Heritage Resources and Cultural Heritage Landscapes Following a review of the Heritage Haldimand Designated Properties Inventory it was concluded that there are no heritage properties located within the LSA. The completed "Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes: A Checklist for the Non-Specialist" (See Appendix G) was completed and identifies the Site ~~as having~~ ~~no potential for cultural heritage resources. The Brooks Road Landfill Site~~ is within the Grand River watershed, which ~~is considered to be~~ a designated Canadian Heritage River watershed. ~~and, therefore, the checklist indicates that there is potential for cultural heritage resources on the property~~ However, [Please explain whether there could be any known heritage attributes that could be impacted] ~~given that the entire Site has been disturbed, it can be confirmed that there is no potential for cultural heritage resources on Site.~~ [MCM may have additional advice once it has reviewed the final ESR.]	
		4.9 (Cultural Heritage - Potential Environmental Effects, Mitigation Measures, and Net Environmental Effects) p. 109	**Original Text** There are no known heritage buildings, structures or sites, archaeological sites or areas of archaeological importance, or cultural heritage landscapes on the Site, which was confirmed through completion of the Vertical Capacity Expansion EA via the Ministry of Heritage, Sports, Tourism, and Culture Industries (MHSTCI) checklists: the Criteria for Evaluating Archaeological Potential; and the Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes. If there are areas within the LSA that may have heritage, cultural archaeological potential, these areas will not be disturbed by the proposed expansion.	**Proposed Changes** We recommend removing this section in its entirety and replacing it with the following mitigation measures addressing impacts to the cultural environment: - Should previously undocumented archaeological resources be discovered, they may be a new archaeological site and therefore subject to Section 48(1) of the *Ontario Heritage Act*. The proponent or person discovering the archaeological resources must cease alteration of the site immediately and engage a licensed consultant archaeologist to carry out an archaeological assessment, in compliance with Section 48(1) of the *Ontario Heritage Act*. - The *Funeral, Burial and Cremation Services Act*, 2002, S.O. 2002, c.33 requires that any person discovering human remains must cease all activities immediately and notify the police or coroner. If the coroner does not suspect foul play in the disposition of the remains, in accordance with Ontario Regulation 30/11 the coroner shall notify the Registrar, Ontario Ministry of Public and Business Service Delivery, which administers provisions of that *Act* related to burial sites. In situations where human remains are associated with archaeological resources, the Ministry of Citizenship and Multiculturalism should also be notified (at archaeology@ontario.ca) to ensure that the archaeological site is not subject to unlicensed alterations which would be a contravention of the *Ontario Heritage Act*. [MCM may have additional advice once it has reviewed the final ESR.]	Comment noted and proposed changes made to the ESR.

Date of Comment	Method of Communication	ESR Section	Comment from MCM	Response
		4.11 (Summary of Net Environmental Effects) Table 4.5 p. 111	**Original Text** Environment Component - Cultural Heritage Summary of Predicted Net Environmental Effects - There are no known heritage buildings, structures or sites, archaeological sites or areas of archaeological importance, or cultural heritage landscapes on the Site; therefore, no net negative effects in terms of Cultural Heritage are expected from the proposed expansion. **Proposed Changes** We recommend removing this table row in its entirety and replacing it with the following text for consistency with ESR section 3.7: Environment Component - Cultural Heritage Summary of Predicted Net Environmental Effects [The suggested text below is if the checklist indicates that there is low potential for archaeological resources] - The screening checklist, Criteria for Evaluating Archaeological Potential, developed by the Ministry of Citizenship and Multiculturalism, was completed as part of the Environmental Screening Report (see Appendix X) determining that archaeological potential within the study area is low and therefore archaeological assessment was not undertaken. [The text below would apply if the checklist indicates that the study area has archaeological potential] - A Stage 1 archaeological assessment (AA) (under Project Information Form number XX) was undertaken on [Date] by [Consultant] in support of this project. The Stage 1 AA has been entered into the Ontario Public Register of Archaeological Reports recommending [Insert whether further AA is recommended (e.g., Stage 2,3,4). The Stage 1 AA is included in Appendix X. [Please include the Stage 1 and MCM letter indicating that the report has been entered into the Register. Then include the outcomes and recommendations of the report, as is in the Executive Summary – just copy and paste, don't summarize.] - The screening checklist, Criteria for Evaluating Potential for Built Heritage Resources and Cultural Heritage Landscapes, developed by the Ministry of Citizenship and Multiculturalism, was completed as part of the Environmental Screening Report (see Appendix X) determining that the study area has low potential for built heritage resources and cultural heritage landscapes. Therefore, no technical cultural heritage studies have been undertaken. [MCM may have additional advice once it has reviewed the final ESR.]	Comment noted and proposed changes made to the ESR.

Comments on Brooks Road Landfill expansion ESR

Table 3 **Comments from GRCA on the ESR**

Date of Comment	Method of Communication	ESR Section	Comment from GRCA	Response
02/13/2024	Email	General comments	Due to the length of time since wetland boundaries were last confirmed (nearly 10 years ago), a reconfirmation of these boundaries with GRCA staff should be completed for wetlands within our jurisdiction. • Please contact GRCA with a preferred date for wetland confirmation in the growing season. Boundaries should be pre-flagged by a qualified professional prior to GRCA's arrival on-site. Clear demonstration that the proposed expansion will not have long-term hydrologic impacts on the water balance of adjacent wetlands compared to existing (pre-expansion) conditions should be provided. The assessment should be scoped to the sensitivity of the wetland features present, and the scale of the proposed expansion's potential impact on the wetlands' hydrology. Additionally, potential temporary impacts of site grading, construction and dewatering activities on groundwater and surface flow towards the adjacent wetlands should be assessed, with mitigation measures proposed as needed. In light of this outstanding information, we would request that an environmental impact study (EIS) be completed as part of the Class EA process to clearly address potential wetland impacts. Terms of Reference should be submitted to our office for confirmation prior to work being undertaken.	An EIS will be completed prior to applying for GRCA permit (including consultation with the GRCA and preparation of a Terms of Reference). Long-term effects to water levels within the wetlands to the north are not expected given that the cell construction period will be temporary and groundwater discharge to the cell during the construction phase will be minor. Based on the relatively low hydraulic conductivity of the natural soils and associated slow groundwater flow velocity, it is not anticipated that significant effects to groundwater levels in the vicinity of the wetlands will be observed during the cell excavation/construction period. All non-contact stormwater and run-off on the site currently discharges to the on-site stormwater management pond. This water management practice will not change under the scenario of cell construction. Accordingly, it is not expected that changes to site grading will affect run-off or stormwater contributions to the wetland to the north.

Comments on Brooks Road Landfill expansion ESR

Table 4 Public comments on the ESR

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
1	01/29/2024	Letter	Paving the on-site road	In the Ministry Review of 2017 the BRE landfill site vertical capacity expansion assessment, BRE stated “omission of commitment to pave the future on-site road from table 7.4 was an oversight on our part. BRE is committed to paving the on-site road as part of the site design for the vertical expansion. This was considered as a mitigation measure through design, as noted in table 5.16, and is essential to ensuring on-site operations remain in compliance with ministry standards.” My question, has the on-site road been paved?	Road is scheduled for paving in 2024.
2			Water run-off/collection	In the spring of 2023, after very heavy rains, I observed from the air, what appeared to be water run-off from the waste site on the northeast face into neighbouring land. This was mentioned at the June PLC meeting, and I requested a site visit to see the method of water collection. It took until October to get the site visit, which was interesting. However, Diane and I were kept so far away from the northeast corner (approximately 250 meters) as to be useless to see what I had requested. I have no proof that the contouring and ditches were inadequate. However, during the visit there was machinery working on the face and perimeter. In November, further observation showed large perimeter ditches and contouring to handle water run-off. I am convinced the work was accomplished because of my inquiries.	Comment Recorded
3			Method of calculating tonnes to cubic meters	In the environmental assessment of 2017, a Rick Li from MOECC questioned the method of calculating tonnes to cubic meters. BRE uses 1 tonne to a cubic meter. Rick Li stated it is normally 0.7 tonnes to a cubic meter. Anything less than 1 tonne per cubic meter would trigger a mandatory landfill gas collection system at BRE. It would financially be in BRE’s interest to not need a gas collection system. Who does the calculations? Does the MOECP do any oversite on this?	Waste density varies by type of waste and compaction efforts. Waste densities are calculated annually based on weigh scale records and air space usage, based on topographic surveys. The density estimate is included in annual reports submitted to the MECP. The average waste density between 2018 and 2022 was 1.956 tonnes per cubic metre. With that said, the threshold for a mandatory landfill gas collection system is a total waste disposal volume of 1.5 million cubic metres. The total Site waste volume is based on the approved base grades (top of granular drainage blanket) and final contours (top of waste). Including Stage 9, the total Site waste volume (1,264,465 cubic metres or 1.26 million cubic metres) remains below the 1.5 million cubic metre threshold. Additionally, and based on the type of waste accepted at the Site, Section 15(3) of Ontario Regulation 232/98 generally exempts sites from requiring a landfill gas collection system where it can be demonstrated that “the nature and quantity of landfill gas generated at the site is not likely to be of significant concern”. Appendix H of the Design and Operations Report Rev. 2 provides an evaluation of the landfill gas generated at the Site and demonstrates that a landfill gas collection system is not feasible for the Site, based on low landfill gas generation rates.

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
4			Waste diversion protocol	Waste Diversion- In the environmental assessment of 2017 the ministry was not satisfied with the response from BRE. BRE was to develop a waste diversion protocol which provides information on the ways that BRE will work with waste generators to provide at source diversion. Was a waste diversion protocol made? If so, what is it?	Yes, a Waste Diversion Protocol was prepared and is included in the Design and Operations Plan (Waste Screening and Acceptance). Based on the waste material accepted, limited recyclable materials are encountered. BRE maintains a portion of the Site for collection and temporary staging of segregated recyclable materials.
5			Gas emissions	In the draft BRE environmental screening document under the yes and no criterion there a yes to every gas emission question. How can anyone approve the expansion? Who would be responsible if it turns out like the Stony Creek expansion?	The screening criteria is used to determine if that criterion is to be assessed as part of the EA. The assessment of potential effects, proposed mitigation and resultant net effects related to gas emissions are documented in Section 4.5. The proponent, Brooks Road Environmental, is responsible for implementing the undertaking as outlined in the ESR, including implementing identified mitigation and monitoring measures.
6			Risks to aviation	In the draft BRE environmental screening document it mentions airports. It states, “A private airfield used for soaring is located approximately 7.5 km north of the site”. The distance is accurate, but the rest is not. The airport name “Grand River Executive Airport”. There are approximately 20 aircraft parked there. There is a flight training school and an aircraft maintenance base. There is a private airport 1.2 km south of the dump site and a sky diving airport approximately 2.5 km east of the site. Any organic waste will bring birds. This is a hazard to aviation.	According to the ECA, the landfill is permitted to receive only solid non-hazardous ICI waste, including contaminated soils, and processed organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant). Since the landfill does not accept municipal organics, it significantly reduces birds on site. Daily landfilling activities (e.g., noise, human presence, heavy machinery) as well as operational practices (i.e., daily cover) provide deterrents for use of the Site by birds.
7			Gates, daily cover, fencing	Over the years I and neighbours have caught BRE not putting on daily cover. We have pictures. It was reported to the MOE at the time. We do not inspect every day and I’m sure this was a common occurrence. Gates were left open when nobody was at the site, contrary to the ECA. We have pictures. There was inadequate fencing for many years. It was not up to the ECA standard. This was reported to the MOE. It took a long time but was finally fixed.	Comment Recorded
8			Expansion on north rail line	Why is there a screening process for expansion of landfill on the North rail line. I attended a notice of public meeting, June 17, 2014. The meeting was to rezone a portion of the north rail line into the waste disposal area. It was assured by the proponent that no land filling on the added lands would occur, and no change to the existing waste footprint would take place. I have documentation if necessary. The rail line was to be used for a buffer zone. This was also mentioned again in a capacity expansion environmental assessment of July 2017.	The assurances made at the time of the zoning change are correct. Landfilling of waste is designated for the existing waste site and within the original property boundary. Waste placement will not occur on the rail land property. The rail lands continue to be used as a buffer zone.
9			Genera comments against expansion	BRE is a company that will say something to get what they want, but not follow through. Can we believe what they say? BRE have not followed the ECA and the MOECP does very little oversight. The environmental screening should not be granted because they have shown they cannot manage what they already have according to government guidelines. I would be interested in the name of the person who decides to grant or reject the application.	Comment Recorded. The Brooks Road Landfill Expansion project is undergoing an Environmental Screening Process, which is a proponent-driven, self-assessment process, and does not require approval by the Ministry. However, as required, BRE has consulted with affected government agencies including the MECP regional office. The Ministry has provided comments on the Draft ESR, which are being addressed. Our Regional office MECP contact is: Joan Del Villar Cuicas Environmental Resource Planner & EA Coordinator

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
					joan.delvillarcuicas@ontario.ca
10	02/01/2024	Letter (maybe email)	General protest and comments against expansion	This is a protest from Haldimand County Residents against the Brooks Road Landfill Capacity Expansion. Presently the Brooks Landfill is at 100,000 cubic metres and they want to increase it to 219,400 cubic metres. The information that received at the on going PLC meetings that the dump should have been filled to capacity roughly by the past June or end of this year.	Comment Recorded
11	02/08/2024	Letter	General comments against expansion	I have lived on Concession 1 with my family for the past 45 years. Since 2016, I have been faithfully going to meetings to try and understand the proposed expansion of the Brooks Road Landfill and its impacts, to no avail. The information provided to date has been inadequate to fully understand and comment on the impacts of the expansion of the landfill. Because of this and concerns I have about BRE's ability to comply with existing requirements, I am against this expansion for the Brooks Road Landfill. While BRE has undertaken "consultation" the quality of the information provided is not sufficient to understand the impacts from the expansion and proposed mitigations. Their history of non-compliance and lack of consideration for social impacts means I do not have confidence the expansion won't negatively impact the environment and the local community. I do not support the expansion of the landfill site.	Comment Recorded
12			Financial impacts to the area	BRE has suggested the expansion to the landfill will provide positive financial impacts to the area. The following statement was in the request for the vertical expansion... "BRE also considered employment opportunities provided by the continued operation of the Brooks Road Landfill Site." Is the Brooks Road Landfill employing Haldimand County residents and if so how many?? How many out of county people are employed? What economic development is Haldimand County receiving from the landfill? How are we (the residents of Haldimand County) going to benefit financially? This idea was also questioned by our former CEO Don Boyle, in the fall of 2016 and the question that still remains is why are we allowing the Brooks Road Landfill to keep growing when Haldimand County closing down live landfill sites and not receiving any major benefit, other than some donations to the food bank. Why is there no broader community benefits sharing approach, or proximity payments to neighbours of the site who have to deal with all the impacts?	BRE employs a combination of people who reside within the boundary of Haldimand County and adjacent municipalities. BRE provides a positive economic impact by: • accepting waste material from Haldimand's Operation department; • Payments associated with hauling treated effluent to Haldimand's waste water treatment plant; • Sourcing fuel, potable water, equipment, materials, and many on-going services to companies located in Haldimand County and the adjacent areas; • Donating clay material to assist 6 Nations with the material needed for final cover installation to allow their landfill to meet closure requirements. BRE would be willing to restart a program that would provide to support to the broad community programs such as the food bank or community related projects that benefit the entire community. BRE would be pleased to support local sports teams through jerseys, sponsoring which provides wide benefits to the whole community .
13			Leachate	Leachate – The last leachate volume we were provided was October 2023 which was 192.5 metres (leachate elevation) and that 1,936,000 litres of leachate had been trucked out in October.	Leachate or contact water is contained within the landfill cell footprint and is either hauled out of the landfill by truck (and discharged at an approved wastewater treatment plant receiver) or treated in the on-site leachate treatment system. The Site is graded to convey clean stormwater away from active landfilling areas to reduce leachate generation.

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
				How is BRE managing additional run-off and ensuring ground water is not contaminated. There was no information provided on how environmental changes and an increase in abnormal weather events, including heavy rainfalls and flooding will affect measures in place to stop contamination. Is the runoff being contained to the outer ditch or did it flood into nearby areas, ditches and streams like flooding everywhere else in the County?	Clean stormwater is conveyed to on-Site internal perimeter ditching that directs collected stormwater to the existing stormwater management (SWM) pond. Site grading, ditching, and the SWM pond have been designed to manage storms up to and including the 100-year storm, noting that the stormwater management pond performance allows sufficient capacity for multiple storm events. Modelling of the 100-year storm event indicates that approximately 0.44 metres of vertical capacity will remain in the SWM pond prior to overflow conditions occurring.
14			Draft summary of the ESR is long and technical	The Draft Environment Screening document is 2617 pages. The "summary" presentation provided contains very little information and suggests the expansion of the landfill site will have no impacts on anything. How does BRE expect the general public to read and interpret 2617 pages of technical information and why hasn't the information been provided in a simplified format which actually contains information people require to make an informed submission?	The Environmental Screening Report itself is a 120-page document that provides a summary of technical studies undertaken for the project. The appendices include technical reports to support the results and findings of the studies. BRE conducted two Public Open Houses to provide information regarding the project in a simplified format including display boards with figures and key points.
15			Advantages of the expansion unclear	Page 127 Summary and Conclusion Environmental Screening Report says, "It was concluded that minor environmental impacts are expected....As a result the advantages of the project outweigh the disadvantages". I am still unclear as to what the advantages of the expansion are. And have the social impacts of the expansion been considered as part of that conversation.	The advantage of the Project is that it will provide BRE with an opportunity to respond to the growing demands from existing customers (waste generators) who need a safe and reliable waste management facility for their residual material for approximately two additional years.
16			Methane gas emissions	Methane Gas Emissions – The monitoring network comprises six nested gas probes installed in three on-site locations (two gas probes per nest) additional pair of gas probes will be installed adjacent to the leachate treatment facility following commissioning. Landfill gas monitoring activities are to be conducted monthly from December 1 to April 30 and on a quarterly basis from May through November. This is "IN Progress". In response to initial comments on the expansion BRE noted, " based on the GHG modeling that has been conducted, the low level of methane generation at the Brooks Road Landfill and the negative energy and economic factors associated with a gas collection and control system, it has been demonstrated that the operation of a landfill gas collection system is not feasible." They note this will be revisited in future if it becomes a problem. I take this to mean, we don't want to spend money on management measures to reduce methane gas emissions. If the landfill will make more money through expansion and intends to take in more refuse which will produce more methane gas, a gas collection and control system should be required, and the cost to implement should not be a relevant consideration for an environmental impact assessment.	Inclusion of Stage 9 will increase the capacity of the landfill by 219,400 cubic metres, which will result in a total capacity of 1,264,465 cubic metres (or 1.26 million cubic metres). As noted in the response to Comment #3, Ontario Regulation 232/98 requires the mandatory collection of landfill gas for new or expanding sites with a total waste disposal capacity greater than 1.5 million cubic metres. Given, that the inclusion of Stage 9 remains below this threshold, the mandatory collection of landfill gas is not required. Additionally, based on the type of waste accepted at the Site and as demonstrated in Appendix H of the Design and Operations Report Rev. 2, a landfill gas collection system is not feasible for the Site. The Site is exempt from requiring a landfill gas collection system in accordance with Section 15(3) of Ontario Regulation 232/98 as it has been demonstrated that "the nature and quantity of landfill gas generated at the site is not likely to be of significant concern". There are 12 landfill gas probes installed at five locations around the landfill cell that are monitored, as required in the ECA. The landfill gas probes are intended to monitor for subsurface migration of landfill gas outside the landfill footprint (i.e., prior to Site boundary and near buildings/structures).
17			Transparency regarding current and future plans for the site	In 2016 when the application for the vertical expansion was being reviewed..."Since the landfill will be expanded vertically and there will be no change to the footprint of the landfill area or vegetation removal, no impacts to vegetation communities and the North Cayuga Swamp Wetland Complex are anticipated. There are also no anticipated impact to aquatic ecosystems as leachate and stormwater runoff will be contained and treated within the landfill Site prior to discharge to the natural environment." BRE received approval for the vertical expansion and now BRE is asking for a footprint increase? One of my	BRE intends to continue serving its existing customer base and is responding to the economic opportunity of providing waste management services to address the continued and growing demand from local and regional customers that require a facility that is permitted to manage the residual materials they generate. With this in mind, BRE reviewed the potential to expand this site further based on: – The current post-diversion solid, non-hazardous industrial residual material generated in Ontario, requiring a local, safe, and secure disposal facility

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
				comments in 2016 was “when will this (expansions to Brooks Road Landfill) stop? Will it ever? Once BRE gets approval they begin plans for another expansion. Expansion after expansion and all we hear is there won’t be impacts, current mitigation measures are enough. How can that be true? And why has the company not been transparent with the community about current and future plans for the site?	– Future post-diversion solid, non-hazardous industrial residual material generated in Ontario, requiring a local, safe, and secure disposal facility – Development and analysis of potential long-term disposal capacity options that BRE could implement in order to continue providing waste management disposal services to their current businesses and customers. Extending the life of the Site will provide BRE with increased flexibility in terms of how best to serve its existing waste clients while remaining competitive within the marketplace. The scarcity of licensed approved disposal sites makes Brooks Road landfill an essential service to the community and region at large and by providing proximity to various construction sites, it reduces the carbon transportation footprint by reducing transportation distances thereby reducing GHGs.
18			Site design	Site design and operations 5.0 in the Annual Compliance report for 2022-2023 – Vegetating by planting trees or shrubs on top of the berm along the western property as required will minimize visual and noise impacts...it says “Compliance Achieved”. All the vegetation on the west berm by the Brooks Road is weeds, so you can see the landfill from the road because of the vertical expansion and also from highway 3 and neighbouring residents. Visual impact continues to remain an issue and will have more of an impact once the vertical footprint increases. Minimal planting of ground cover is not an effective mitigation to visual impact and noise.	The landfill is screened along the western property boundary by a vegetated screening berm constructed to an elevation of approximately 203 to 204 metres above mean sea level (m AMSL), approximately 5 to 6 m higher than the Brooks Road approximate elevation of 198 m AMSL. A fence with a privacy screen has been installed on top of the western screening berm, increasing the visual barrier to an elevation of approximately 205 to 206 m AMSL (almost 8 m higher than Brooks Road).
19			Expansion on north rail line	The former CSR rail bed (4.7 acres), which BRE was given to be used for clean spoil stockpiling, also to form a hydrological divide between the landfill and the wetland complex to the north. Permanent erosion and sediment control measures such as heavy duty silt fencing and a vegetative buffer are in place at the north toe of the clay stockpile slope. The CSR corridor will remain as a buffer between the landfill Site and the wetland complex. This expansion will change the buffer zone and there will be less space for the clean spoil. Is this expansion on the 4.7 acres? My understanding is that is not the intended land use for that area.land!!	Landfilling is designated for the existing waste site and within the original property boundary. Waste placement will not occur on the rail land property. The rail lands continue to be used as a buffer zone, and will continue to be used for stockpiling of clean soil during construction, filling, and closure activities at the Site.
20			Paving the on-site road	A potential condition of approval for the vertical expansion was the commitment to pave the future on-Site road, as mentioned by the ministry's Air Quality Analyst; therefore road paving is imperative in conjunction with other mitigation strategies for controlling fugitive dust emissions from the landfill operations. Omission of the commitment to pave the future on-Site road was an oversight on the part of BRE, as BRE is committed to paving the on-Site road as part of the Site design for the vertical expansion. This was considered as a mitigation measure through design and is essential to ensuring on-Site operations remain in compliance with Ministry standards. This still has not been done. If BRE can not comply with this simply request, how can we be confident they will manage their other environmental mitigation obligations.	Road is scheduled for paving in 2024.

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
21			Traffic and road maintenance	When passing by the Landfill the week of January 29th Brooks Road was extremely muddy with large clumps of mud from the Landfill right out to highway 3. Also the Brooks road is damaged with lots of potholes due to all the heavy truck traffic. Trucks don't always use the approved haulage route. The summary report noted there would be no impacts from traffic as truck traffic wasn't set to increase. I'm curious to understand the methodology used to assess this. Was it only a desktop assessment with tonnage figures and approved haulage routes. Or did the subject matter expert, actually come out to site for a several days and count trucks and look at the actual route they take? How is BRE contributing to the upkeep and maintenance of the roads its trucks damage.	The state of Brooks Road with respect to potholes is a Township issue and should be dealt with by the Township when they review their road network and decide which roads need improvements. As Brooks Road is used by trucks to access the BRE landfill, it should be designated as a truck route and should therefore include a pavement structure that can accommodate heavy truck traffic. Truck traffic is not set to increase because there is no change to the annual fill rate limits with the proposed expansion. The project is proposing to increase the capacity of the landfill to be operational for approximately two additional years. GHD completed one weekday and one Saturday count at the site driveway and at Hwy 3 to get the a.m., mid-day, and p.m. peak hour turning movement counts and observed what routes the vehicles took. At the time of the count, there was actually had more traffic to/from the site than usual due to some transfer of clean clay to another property which resulted in an additional 75 loads throughout both days. BRE is not required to maintain Brooks Road, this is the responsibility of the Township of Cayuga.
22	February 1, 2024	Email	Site Operations	We have lived on the McFarlane Rd. for 48 years on a piece of property where we have planted pine and walnut trees that have matured into a little park. We have a little running stream, lots of wild life and before the dump fresh odourless air to breath. Now we breathe methane gas air. Methane gas is hazardous to our health and well being. It causes cancer, heart and lung disease. I note the summary from the Environmental Screening Report indicated the expansion will have no impact on recreational activities, however on warm windy days, I can no longer enjoy sitting outside by the pool because of the smell which travels from the facility. While the report suggests all environmental impacts are negligible because mitigation and management measures are currently in place, I raise serious concerns about the proponents compliance with said management measures. The proponent is not overseeing the dump with the regulations they promised to implement. Secure fencing was only put in place after the community requested it for safety reasons, despite being a requirement to stop wildlife from entering the site.	Comment noted.
23			Odour	The report indicates "best practice" odour management will be implemented. There is no detail on what this means. The existing site currently emits a foul odour of methane gas. It occurs even when there is no wind, damp, and foggy. It travels south and sits in the gully. What "best practice" measures have been put in place to mitigate odour, what additional mitigations will be put in place from the expansion and what improvements have been made in odour control?	The Odour Best Management Practices are detailed in the Odour Management Plan Report found in Appendix D of the ESR.
24			Site Operations/Groundwater	I also have concerns regarding the impacts to surface water, groundwater and hydrogeology. The summary noted existed mitigations are sufficient, but that a large aquifer also exists below the site. The proponent has not done a sufficient job communicating how it	According to the ECA, the landfill is permitted to receive only solid non-hazardous ICI waste, including contaminated soils, and processed organic waste (e.g., dewatered sewage sludge from the Caledonia Sewage Treatment Plant).

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
				treats leachate. The summary report notes a larger area will now flow into the treatment pond and additional planting will be used to support existing surface water conditions. There has also been no information provided on the type of waste the facility is taking and potential health risks - for example, is there potential for the waste to contain PFAS or PFOA particulates? And are the existing management measures sufficient to stop this leeching into groundwater supplies?	The MECP has set standards for landfill liners and collection and treatment of leachate. Leachate or contact water is contained within the landfill cell footprint and is either hauled out of the landfill by truck (and discharged at an approved wastewater treatment plant receiver) or treated in the on-site leachate treatment system. BRE is required to meet groundwater quality standards for the entire site at the site property boundary.
25			Site Operations	BRE also has a history of non-Compliance regarding leachate levels. MECP issued an order for the company to remove leachate level is at or below 196.75 metres. The order was meant to be rectified by March 12, 2020 and is now past due. The residents surrounding the dump should not have to monitor the actions of the BRE.	Comment noted.
26			Site Operations	The proponent has also failed to put the daily cover on which was a commitment made to the community. This resulted in garbage blowing to the north side of the fence and affects our visual amenity of the area.	Comment noted.
27			Site Operations	There have also been instances where the proponent has impacted private property while carrying out works on the site with no rectification undertaken until the landowner raised the issue, this included bulldozing landfill into a farmer's field. Is this the approach taken toward environmental management?	Landfilling of waste is restricted to the existing waste site and within the original property boundary. The rail lands to the north are currently used for stockpiling of clean soil during construction, filling, and closure activities at the Site.
28			Paving the on-site road	2017 Ministry of BRE Landfill site Vertical Environment Assessment the dump promised to pave the inside of the dump entry. We visited the dump in October 23, 2023 and it has not been paved. Another example that proponent does not carry out management measures as promised.	Road is scheduled for paving in 2024.
29			Site Operations	We also have concerns about the general conditions of the site where critical infrastructure is not maintained to appropriate standards, thus increasing the likelihood of an incident. The Leachate Digester has an outlet pipe which is held up by bracing with 5 gallon plastic pails 5, which exits into an underground tank. When we went to look take a closer look, we were told to get back as the smell would be dangerous. The Febreze mister pipe was being held up by sticks, that a strong wind storm would blow down. The febreze is just one more chemical smell to cover up the methane.	Comment noted.
30			Site Operations/Leachate	With the amount of rain we have had this year the pump would be running 24-7 in order to keep up, not just 5 days a week. This again contributes to concerns I have about how overflow of the treatment pond will be managed, especially as climate change means more frequent adverse whether events including heavy rainfall and flooding.	Leachate or contact water is contained within the landfill cell footprint and is either hauled out of the landfill by truck (and discharged at an approved wastewater treatment plant receiver) or treated in the on-site leachate treatment system. The Site is graded to convey clean stormwater away from active landfilling areas to reduce leachate generation. Clean stormwater is conveyed to on-Site internal perimeter ditching that directs collected stormwater to the existing stormwater management (SWM) pond. Site grading, ditching, and the SWM pond have been designed to manage storms up to and including the 100-year storm, noting that the stormwater management pond performance allows sufficient capacity for multiple storm events. Modelling

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
					of the 100-year storm event indicates that approximately 0.44 metres of vertical capacity will remain in the SWM pond prior to overflow conditions occurring.
31			Site Operations	Where they test the level of the leachate at the pipe it was all over grown with grass at least 2 ½ feet high. Another example of basic maintenance not being undertaken around the site.	Comment noted.
32			Transparency	During a scheduled tour, we asked to visit the northeast corner of the of the dump to see if they had the proper ditching. We were told we were unable to visit that section of the site for safety reasons and the tour abruptly ended. This again raises concerns that BRE are not being transparent with the community.	Comment noted.
33			Reporting	BRE says the water they are putting into the ditch is safe and not contaminated, but there is no ongoing communication to residents about monthly reporting figures, any incidents or issues.	Operations and Monitoring Reports are available to view on BRE website (**Documents | br-environmental (brenvironmental.com)**)
34				The Stoney Creek dump is presently having trouble with environment due to foul smells of methane. The Hamilton Wentworth District School Board has complained from families for health issues from their children. I spoke to one of the parents that go to the school and she was just livid. Similar to BRE, they are looking to expand this dump as well. The Tom Howe dump in Hagersville was closed in 2015 but still gives off toxic gas from it's pipes or stacks.	Comment noted.
35			Traffic and road maintenance	The number of heavy vehicles which travel to and from the dump, have also damaged the local road. While trucks are not mean to access or exit the site via McFarlane Road, they do on numerous occasions. The road is not built to support the weight of large trucks and their constant use has led to deterioration of the road. How does the dump plan to manage the transport impacts? The report says there are no transport impacts. How is this possible?	The state of Brooks Road with respect to potholes is a Township issue and should be dealt with by the Township when they review their road network and decide which roads need improvements. As Brooks Road is used by trucks to access the BRE landfill, it should be designated as a truck route and should therefore include a pavement structure that can accommodate heavy truck traffic. Truck traffic is not set to increase because there is no change to the annual fill rate limits with the proposed expansion. The project is proposing to increase the capacity of the landfill to be operational for approximately two additional years. GHD completed one weekday and one Saturday count at the site driveway and at Hwy 3 to get the a.m., mid-day, and p.m. peak hour turning movement counts and observed what routes the vehicles took. At the time of the count, there was actually had more traffic to/from the site than usual due to some transfer of clean clay to another property which resulted in an additional 75 loads throughout both days. BRE is not required to maintain Brooks Road, this is the responsibility of the Township of Cayuga.
36			Social Benefits	The social impact of the dump is probably one of the greatest concerns. Nearby residents have to put up with the smell, change their plans or activities based on how strong the smell is on a given day and waste time ensuring compliance. The summary report notes the dump contributes to the local economy through jobs. How many jobs? And what about benefits to nearby residents? Across the world, projects are acknowledging that communities most impacted by these types of activities should also benefit from their presence.	BRE employs a combination of people who reside within the boundary of Haldimand County and adjacent municipalities. BRE provides a positive economic impact by: • accepting waste material from Haldimand's Operation department; • Payments associated with hauling treated effluent to Haldimand's waste water treatment plant;

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
					• Sourcing fuel, potable water, equipment, materials, and many on-going services to companies located in Haldimand County and the adjacent areas; • Donating clay material to assist 6 Nations with the material needed for final cover installation to allow their landfill to meet closure requirements. BRE would be willing to restart a program that would provide to support to the broad community programs such as the food bank or community related projects that benefit the entire community. BRE would be pleased to support local sports teams through jerseys, sponsoring which provides wide benefits to the whole community .
37			Social Benefits	There is another dump that two reserves split Oneida Nations and Chippewas on the Thames are both compensated through a community benefit agreement. They split 4 percent of the gross revenue and $4 per tonne from the landfill. The two communities split $1,000,000 a year from the people who owns the dump. What community benefit program are they proposing for the residents nearby to mitigate the long-term impacts from the dump?	BRE employs a combination of people who reside within the boundary of Haldimand County and adjacent municipalities. BRE provides a positive economic impact by: • accepting waste material from Haldimand's Operation department; • Payments associated with hauling treated effluent to Haldimand's waste water treatment plant; • Sourcing fuel, potable water, equipment, materials, and many on-going services to companies located in Haldimand County and the adjacent areas; • Donating clay material to assist 6 Nations with the material needed for final cover installation to allow their landfill to meet closure requirements. BRE would be willing to restart a program that would provide to support to the broad community programs such as the food bank or community related projects that benefit the entire community. BRE would be pleased to support local sports teams through jerseys, sponsoring which provides wide benefits to the whole community .
38			Northern Rail Road	The property along the north railway line is being used right now as a buffer zone and a place to store the clay to put on the existing landfill for a daily cover. Where will the buffer zone be? In 2014 Dave Bruce went to a council meeting June 17,2014 where the BRE wanted to amend the Designation of the official plan and zoning by-law 1H86 of the subject property to facilitate the extension of the northern rail line to act as an additional buffer zone and temporary storage of clean clay relocation of groundwater monitoring wells. It has been assured by the proponent that there will be no land filling on the added lands and no change to existing waste footprint of the land site will take place. The BRE want the extension of the rail line to expand	The assurances made at the time of the zoning change are correct. Landfilling of waste is designated for the existing waste site and within the original property boundary. Waste placement will not occur on the rail land property. The rail lands continue to be used as a buffer zone.

Comment #	Date of Comment	Method of communication	Topic	Public comment	Response
				the dump. We cannot believe anything they say. They are note held accountable to any commitments they make.	
39			Visual Screening	The outside of the landfill is disgraceful, garbage everywhere, and carcasses of dead animals. BRE has also committed to planting vegetation eg. Trees & shrubs along the berm but this has not yet taken place. Will this be the same approach they take to measures proposed to mitigate impacts to the expansion?	The landfill is screened along the western property boundary by a vegetated screening berm constructed to an elevation of approximately 203 to 204 metres above mean sea level (m AMSL), approximately 5 to 6 m higher than the Brooks Road approximate elevation of 198 m AMSL. A fence with a privacy screen has been installed on top of the western screening berm, increasing the visual barrier to an elevation of approximately 205 to 206 m AMSL (almost 8 m higher than Brooks Road).
40			ESR	The new BRE Environmental Landfill Expansion Screening Report is 2,617 pages. BRE did very little to help the community understand what the report meant, likely project impacts and the proposed mitigations. The summary report provided was very high-level, contained a lot of jargon and essentially said, there are no impacts to anything. We have outlined our complaints in the above and do not want to police the Brooks Road Landfill Expansion Environmental Screening to the north railway line. Little by little, the site keeps expanding and keeps encroaching on our way of life. Our community takes the garbage from all over Ontario but receives no benefit from BRE, despite the profits they take in. The information we have been provided is not sufficient for us to understand the impacts and how they will be managed. We do not support the approval of the expansion of the dump and believe it will have negative environmental and social impacts on the surrounding area.	The Environmental Screening Report itself is a 120-page document that provides a summary of technical studies undertaken for the project. The appendices include technical reports to support the results and findings of the studies. BRE conducted two Public Open Houses to provide information regarding the project in a simplified format including display boards with figures and key points.
41	February 1, 2024	Email	Petitions	Please find attached names and phone numbers of local residents that do not wish the Brooks Road Landfill to expand, in other words they are objecting to the expansion!	Comment noted

This a protest from Haldimand County Residents against the Brooks Road Landfill Capacity Expansion. Presently the Brooks Landfill is at 100,000 cubic metres and they want to increase it to 219,400 cubic metres. The information that received at the on going PLC meetings that the dump should have been filled to capacity roughly by the past June or end of this year.

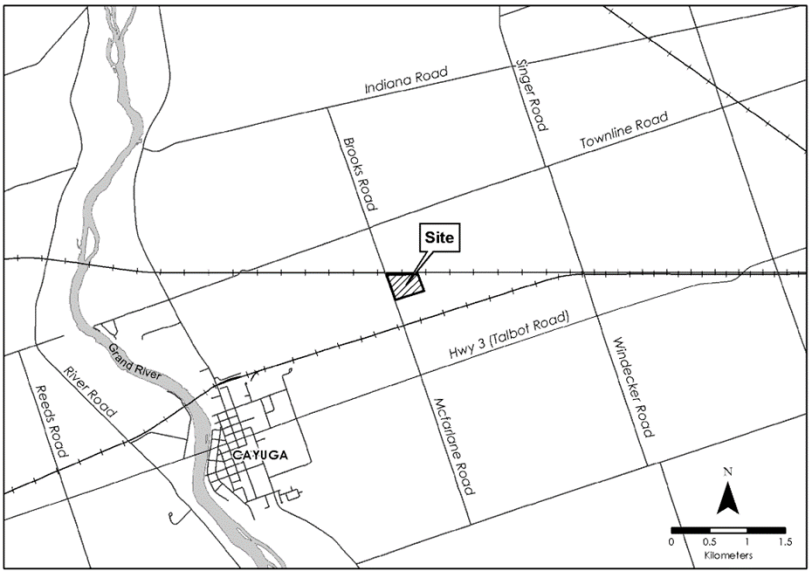
Notice of Completion

Brooks Road Landfill Capacity Expansion

Notice of Completion



Brooks Road Environmental, owners and operators of the Brooks Road Landfill, have completed an Environmental Screening Process for the proposed expansion (vertical and horizontal) of the Brooks Road Landfill, located at 160 Brooks Road near Cayuga, Haldimand County, Ontario. The capacity expansion proposed under this Environmental Screening Process is for approximately 219,400 cubic metres (including waste and daily/final cover).

The proposed capacity expansion would allow Brooks Road Environmental to respond to the growing demands from waste generators and customers who need a safe and reliable waste management facility for disposal of their post-diversion solid, non-hazardous industrial, commercial and institutional waste. The proposed capacity expansion will add capacity equal to approximately two additional years of waste acceptance over and above the remaining/current approved capacity. There are no changes to the annual fill rate limits proposed as part of this project.

The Environmental Screening Process

The proposed project is subject to the Ministry of the Environment, Conservation and Parks' (MECP) Environmental Screening Process for waste management projects, in accordance with O. Reg. 101/07 under the *Environmental Assessment Act.* It is being conducted in accordance with the planning and design process outlined in the MECP's "Guide to Environmental Assessment Requirements for Waste Management Projects."

The Environmental Screening Process involved identifying and applying screening criteria to determine and describe potential environmental effects, public/external agency consultation, and the development of measures to mitigate identified environmental effects.

The results of the process were documented in an Environmental Screening Report, which will be available for a 60-day calendar day review period starting April 3, 2024, and ending on June 2, 2024. The Report will be posted online at https://www.brenvironmental.com/.

Hard copies of the report are available at the Cayuga Public Library & Heritage Centre at 19 Talbot Street West in Cayuga, Ontario during the library's operating hours of Tuesday to Thursday from 10 a.m. to 8 p.m. and Friday to Saturday from 10 a.m. to 5 p.m. If you require an alternative format, please contact:

Blair Shoniker, MA, RPP
Senior Waste & Environmental Planner
GHD Limited

Visit the project website to learn more and sign up for project updates.

In addition, a request may be made to the MECP for an order requiring a higher level of study (i.e. requiring an individual/comprehensive EA approval before being able to proceed), or that conditions be imposed (e.g. require further studies), only on the grounds that the requested order may prevent, mitigate or remedy adverse impacts on constitutionally protected Aboriginal and treaty rights. Requests on other grounds will not be considered. Requests should include the requester contact information and full name. Requests should specify what kind of order is being requested (request for conditions or a request for an individual/comprehensive environmental assessment), how an order may prevent, mitigate or remedy potential adverse impacts on Aboriginal and treaty rights, and any information in support of the statements in the request. This will ensure that the ministry is able to efficiently begin reviewing the request. Please visit the ministry's website for more information on requests for orders under section 16 of the Environmental Assessment Act at: https://www.ontario.ca/page/class-environmental-assessments-section-16-order.

The request should be sent in writing or by email to:

Minister Ministry of the Environment, Conservation and Parks 777 Bay Street, 5th Floor Toronto ON M7A 2J3 Minister.mecp@ontario.ca	Director, Environmental Assessment Branch Ministry of the Environment, Conservation and Parks 135 St. Clair Avenue West, 1st Floor Toronto ON M4V 1P5 EABDirector@ontario.ca	Tim Danyliw, P.Eng, PMP Project Manager, Brooks Road Environmental 162 Cumberland Street, Suite 300 Toronto ON M5R 3N5 tim@gpenvironmental.ca
